As to Mr. Garfield's proposition to neglect, partially Arithmetic and kindred subjects, and substitute some undefined "dealing with natural objects," I stoutly protest against it. He leaves out of sight the fact that these branches are taught for two purposes; first, their practical value; second, the development of the reasoning faculty: and this last is by no means a small matter. The time allowed for this is between the ages of seven and seventeen years. Little more than a beginning is accomplished at the age of between twelve and fifteen years. Before this age the mind is too immature to open to the logic of natural life, or to observe it closely enough to feed and grow upon its study. But just as the pupil reaches this point in development, where he may pursue such a course successfully, the parent steps in and he must be hurried through his last two preparatory years. Indeed the farmer's boy is more frequently taken from school without these "extra years" as they sometimes term them. This is lamentable, it is true, but don't blame the teacher for it, and above all things don't ask him to neglect the rudiments for which his time is already too little.

Furthermore, it is better to leave the teacher, especially if incompetent, to pursue a well-de-

fined system, than to denounce or discourage him in it. Certainly till a better one is devised it is wisest not to take the present system from him, and hurl at him as a substitute high-sounding phrases which only confuse him.

Middlesex Co., N. J.

FALLACIES ABOUT FRUIT.

T. T. LYON.

A VERY common fallacy among the planters of fruit trees is the assumption that, because a fruit posesses qualities calculated to attract the attention of the mass of consumers in town and city markets, and has hence become popular with dealers, it is also to be accepted and planted by those whose purpose it is to produce fruits strictly for home use.

Such planters, including the mass of farmers, together with the owners and planters of village and city gardens, should ever keep in mind the fact that buyers in the markets, as a rule, select by the eye: and owing to this fact, many showy but austere, tough or indifferently flavored fruits, pass current at the fruit stalls, and, if the trees are vigorous, hardy and productive, they become popular with market orchardists; while other sorts, so nearly "Iron-Clad" as to succeed in unfavorable localities, from this cause, with only a secondary reference to their flavor or texture, acquire wide notoriety, as in the case of Ben Davis, Willow Twig, Wealthy, Edgar Red-streak, and several others.

Persons planting for the supply of a home should recollect that they, if any one, can afford to grow and consume the *best*;—that they need not consider for their purposes the ability of varieties to bear the rough treatment incident to the process of shipment, and that many of these "best varieties," from peculiarities of the tree, are not adapted to the market orchard; and that more of them hide their luscious qualities beneath an unattractive surface; while yet others are of such a delicate texture as to essentially unfit them to sustain the rough treatment of the marketing processes with impunity. The home planter, having properly digested these facts, may be impelled to ignore the lists of commercial planters, and to seek the information adapted to his needs from other sources; selecting sorts which, though less outwardly attractive or profitable, in a merely pecuniary sense, will yet, with lapse of years, grow in his esteem.

I think few observers will escape the conviction that some of our very finest fruits are falling into comparative oblivion, less because they are being crowded aside by newer or better competitors than for the reason that the *market idea* is being prominently put forward, not by commercial planters only, but by Horticultural Associations as well, that people are in danger of forgetting that there are really varieties better or more desirable for such purpose than the trash that, by commercial orchardists and dealers, is made to do duty as fruit to the motley crowd that haggle and jostle each other in the marts of our great cities.

MISTAKEN NOTIONS.

THERE is an idea prevalent among the great mass of cultivators of the soil, that whatever one of their number under his special conditions of soil, climate, etc, can successfully produce, another similarly circumstanced with regard to these conditions, should be able to produce likewise, without any reference to his particular fitness or circumstances. These forget that it has taken the successful man, perhaps, years to learn the right methods as well as to bring his soil to the proper condition, and to make needed improvements. Nor should it be forgotten that closeness of profitable markets and thrifty facilities for reaching them, are important conditions in this connection. Yet many imagine that by reading a faithful report of the *modus operandi* followed by the successful producer and adopting it, they would be able to secure a like success, forgetting that his experience has been accumulated by years of trial and from small beginnings. And if, under this impression, they rashly rush into new undertakings, what other result than disappointment or perhaps total failure, can be reasonably expected?

Who would expect that a machinist who had served an apprenticeship in learning to make a steam-engine would be able to compete successfully in watch-making with a watch-maker who had spent years in mastering his trade, and who, moreover, may have gained skill and knowledge by developing, in mature years, ideas conceived perhaps in his less experienced days? Yet it would be just as reasonable, and no more, to expect that any cultivator of the soil, without the advantage of previous apprenticeship, should be able to compete successfully with experienced producers in their specialties. I am willing to allow that there may be exceptions, but only enough to confirm the general rule. Natural tact and special circumstances may combine to render an attempt successful, but where one succeeds, ten fail; and it is, perhaps, more than doubtful whether the gains of the one compensate the community for the failure of the ten.

An apt illustration of this truth occurred a few years ago. Then every farmer, in some sections of the country had, according to his own notion, an opportunity of getting rich, of rapidly making any amount of money by planting and growing hops and tobacco. Many blindly rushed into these industries, reminding me of a little scene I have noticed more than once—where the leader of a flock of sheep feeding in a fair pasture, wandering along the fence or wall, espies an opportunity of breaking bounds and succeeds in doing so, when straightway the rest follow the leader with the exception, perhaps, of one or two that cannot get over. The result is uneasiness on both sides, perhaps greatest with the few left behind. But to the large majority of those who changed their ordinary occupations for the cultivation of hops and tobacco the result was so disastrous that history and tradition should hand it down as a guidance and warning to succeeding generations of agriculturists.

The successful production of any special crop, presupposes many favorable conditions, and especially versatility on the part of the producer. Aside from experience, perhaps more depends in such a matter on this versatility than on any other thing that could be mentioned. In undertaking a specialty, the cultivator should start from small beginnings, and necessary expenses should be provided for by adapting all conveniences especially to the end of securing success in the undertaking. As most farmers gain their money by a slow process, it would be to their interest to adopt new enterprises with much caution, feel their way carefully, and only when success is assured "rush in."

W. H. WHITE.

EDUCATIONAL FACTS FROM MISSISSIPPI.

NOTWITHSTANDING the large appropriations made for public schools in the State of Mississippi very few children get more than a bare smattering of education. The style of reading of the smartest scholar is simply execrable, and his ideas of Geography and Grammar little less vague than his notion of universal history. Five months out of the twelve is the time allowed for free schools, from the middle of January to the middle of March and from the first of July to the last of September. For services rendered in these free schools the teachers are allowed $30,00 for 20 days schooling of of 25 scholars and 6 cents for every additional scholar. If the average falls below 25, six cents a scholar only are allowed. Twenty-day reports are required, signed by the trustees and signed by the superintendent of education, in order to draw the money from the treasurer. There are many thinly-settled neighborhoods where the scarcity of children preclude free schools, and if teachers be obtained, they must rely on individual subscriptions, which are usually meager and difficult of collection. When, however, a teacher succeeds in getting such a number of names on his roll-call as will make the thing "pay," his soul, if it be a conscientious soul, will inevitably faint within him at the Herculean labor involved in drilling anything like accuracy of speech or information into the pupils' heads. They one and all have the lingo which free intercourse with ignorant white and colored people induces. Such expressions as. "T'aint no use; nobody don't do it;' 'I couldn't git to go;' 'I 'lowed to go,' I 'yeard him say so," are of continual recurrence. Send a scholar to the blackboard for exercises in Grammar and the intricacies of error into which he lapses are enough to discourage the most determined dominie. P. P.

HAY-CAPS.

As the time is not very far distant to haying, I wish to speak a word in favor of this useful article to the hay-maker. Until he has once used them, he does not know the value of them, and after once being used, I never knew a farmer to discard them. They will save their cost in a short time, by protecting the hay from dews and rains.

It is for the health of stock that they be provided with good hay and when one uses hay-caps he can add greatly to the value of his hay, after it is cut and cocked, by protecting it from ruin, as well as heavy dews. It often happens that a shower causes a great deal of extra labor, and this can be prevented, in a measure, by capping. Hay which is properly put up and capped, will pass through quite a long storm and come out in very good condition. Caps are also very useful to place over barley, or beans, while curing. They should be one yard square, with a pointed stick about 14 inches long, tied on at each corner. These are to tuck into the hay, to prevent the wind from blowing them off. A water-proof coating should also be applied to them. The following is a good and cheap dressing, and one it is said that will not crack: In one-half gallon of boiled linseed oil stir two ounces of soft-soap; apply with a brush to one side only, two or three coats. F. H. D.

May 24, 1878.

THE JERSEY CATTLE SALE.

THE sale of Mr. E. P. P. FOWLER'S last importation of Jersey cows was made at Messrs. A. M. HERKNESS & Co.'s Bazaar, in Philadelphia, May 21st. The following memoranda will show that prices were fair, and that the sale was not local:

Annie Laurie, J. B. Davis	$310
Annette, Jas. Young, Middletown	255
Antelope, S. C. Kent	285
Boulivot Lass, Jos. Lauer, Riverton, N. J.	245
Bluebelle, Johnson & Co.	280
Brunette, S. A. Brown, Lehigh Co	280
Bouley Bay Lass, J. B. Davis, Richmond, Va.	400
Christabel, M. Reeves, Richmond, Ind	300
Her b. c., H. Lippincott	40
Croppy, Caleb Wood, Columbus, N. J.	275
Diana, F. C. Biddle, Chadd's Ford	175
Fairy, S. C. Kent, West Grove	305
Grouville Lass, Mrs. M. N. Rogers	430
Jeanette, I. Morton, Mill Creek	215
Lucilla, S. C. Kent	230
Lucy, Elwood Evans, Marlton, N. J.	210
Maria, A. E. Kapp, Northumberland	300
Mignonne, James Young	250
Princess Mary, S. C. Kent	235
Priscilla, Mrs. M. N. Rogers, Wilmington, Del.	400
Rosanna, J. Macaulay, Philadelphia	150
Her b. c., same buyer	30
Rose, H. Lippincott, Philadelphia	290
Her b. c., same buyer	95
St. Catharine, W. Chapman, Bethlehem	190
Her c. c., 2 weeks old, John Patterson	160
Sylvia, Johnson & Co., New London, Ct.	400
The Countess, Elwood Evans	255
Venus, M. Reeves	240
Total for 25 two-year olds and 4 young calves...	$7,720

CATALOGUES, &c., RECEIVED.

THE WOOD SYSTEM of Harvesting Machines. To the Jurors in the class of Harvesting Machines at Paris Exhibition, 1878. A neat pamphlet in French and English, relating the success of the "Wood System" and a list of prizes taken all over the world by the Walter A. Wood Mowing and Reaping Machine Co.

THIRD ANNUAL REPORT of the American Veterinary Hospital, West 54th St., between Sixth and Seventh Avennes, N. Y., containing classification of 1478 cases treated at the hospital during the collegiate year ending March 1878, terms, etc., etc.

Pomological.

THE FRUIT-BELT OF MICHIGAN.

THIS name, given to the fruit producing region about St. Joseph in that State, has become pretty widely known over a large extent of country through agricultural papers and otherwise, in a general way, but its advantages have never been given in detail. St. Joseph, the center of the great fruit-growing operations, has always been placed in the foreground, and the high prices that land has obtained in that immediate vicinity, have been a bar to many men of small means going there, or seeking detailed information in regard to this fruit growing region, the best perhaps in the world.

It is now about twenty-five years since a few men in St. Joseph, favorably impressed with the locality as a peach-producing section, commenced putting out peach orchards of select fruit to supply the Chicago market, and they succeeded beyond their most sanguine expectations. The soil, generally, was a very light sand, worth nothing for farming purposes, but it seemed peculiarly adapted to peach-growing, the profits of which were so great that the land advanced from a mere nominal sum to two hundred dollars per acre for the wild, uncultivated tracts, while many orchards in bearing sold for as much as one thousand dollars per acre. The great success in peach-growing induced the planting out of other fruits, until apples, pears, plums, cherries and the small fruits, blackberries, raspberries and strawberries were in abundance, with nearly as much profit as the peaches.

As the "fruit-belt of Michigan" is formed by its proximity to the east shore of Lake Michigan, strangers would naturally inquire why lands should be so dear at St. Joseph, when there was so much land to be obtained up and down the shore from that point, at a much lower rate. St. Joseph being a lake port, with a good harbor for the accommodation of sailing vessels and steamers, was for years the only point of shipment for fruit from that region of country, and as the land carriage of fruit was expensive and injurious, lands only in the immediate vicinity of the town, were desirable for the purpose of raising fruit for shipment, and consequently advanced to extravagant figures.

The years 1870 and '71 saw the completion of the Chicago & Michigan Lake-Shore Railroad, from New Buffalo on the Michigan Central Railroad, to Muskegon, a lake port north of New Buffalo some one hundred and twenty-five miles, and the great manufacturing point of pine lumber for western Michigan. From New Buffalo to St. Joseph, a distance of twenty-seven miles, the railroad track is about one mile from the shore of Lake Michigan, opening up a region of country fully as good for fruit-growing as St. Joseph and vicinity, and it is of this point I propose to speak now, setting forth some of the advantages to be derived by settling there, even by men of moderate means.

Along the lake shore, between New Buffalo and St. Joseph, extending back from the lake some three miles, was a section of very heavy timber, that had been neglected for years by the pioneers of western Michigan. The soil of the land commencing at the lake, is a light sand, gradually becoming heavier until it merges into a loam, and usually at the distance of three miles becoming a mixture of clay and gravel. As fruit-raising had not become one of the leading industries in that part of Michigan in the early days of the pioneers, and as the lands a few miles from the lake were considered much better for producing grain, the region of country beyond this belt was early settled and improved, as much so as any part of Michigan, and farms are selling there at this time for from fifty to seventy-five dollars per acre, while on the lake shore they can be bought at from fifteen to twenty-five dollars. The cause of this state of things is this: For years before the building of the railroad along the shore of the lake, parties engaged in the hard-wood lumber trade located on that strip of heavy timber, manufacturing it into wood and lumber, and shipping it to Chicago, the present writer among the number. The transportation was conducted by building piers out into the lake, where vessels could come and load the products of the forest. With this branch of business came a class of people adapted to lumbering, but very poor farmers. Many of them bought land, and depended on selling their timber to meet their daily wants—a kind of hand-to-month way of living. On the opening of the railroad through that section, the timber had been exhausted, and the only alternative the settlers had, was to farm their land in their poor kind of way. To make up for deficiencies in receipts, many of them mortgaged their land, and allowed it to be sold under the mortgage foreclosure, and it is these lands to-day that are offered at such low prices; for most of them are held by Eastern capitalists who want to realize what money they can out of the land, but will sell it at very low figures rather than hold it.

On the opening of the railroad, the people of St. Joseph found there would ultimately be a "new deal" in regard to land, and that prices there must decline. Cheaper lands, as good for fruit-raising, or better than that which they held at two hundred dollars per acre, were brought into competition with it, while market facilities were nearly as good. The only lands that stood in the way were those between St. Joseph and New Buffalo, as the railroad in leaving St. Joseph for the north, ran farther from the lake, and in a few miles left the fruit-belt entirely. With the pecuniary interest St. Joseph has in her near-by land, she has managed thus far to keep this section of cheap lands in the background, so that but few know they can buy, within fifteen miles of St. Joseph for fifteen dollars per acre, land more productive and with as good market facilities as the districts where they used to ask two hundred dollars per acre, but are willing now to take something less.

In regard to the successful growth of trees in the section of country I have mentioned, I can speak from "the card," as I was in business there for twelve years. Apple trees of ten years' growth are as large as those of fifteen years in western New York, and I should be surprised if an orchard of six years' growth had not produced apples enough to pay for the land it occupied. I have in my mind now an apple orchard of twenty-five acres, set sixteen years ago, the trees of which are as large as many orchards in western New York which have been set twenty-five years, and the bark of those trees is as smooth as that on trees of five years' growth in the latter place. This orchard is on a farm of one hundred acres, with good buildings, the owner of which became involved, and it was closed out under a mortgage sale. Three years ago, it was bought by a party for thirty-five hundred dollars; last fall the apples were sold on the trees for nine hundred and fifty dollars, and one year ago last fall, for fifteen hundred dollars, with a prospect now of a yearly revenue from the orchard for years to come, of from fifteen to twenty-five hundred dollars—not a bad investment for these hard times.

Another farm of eighty acres, closed out under a mortgage sale, and lying across the road from this sixty acres, cleared, good barn, but no house, with ten acres of orchard, was offered by the mortgagee for two thousand dollars with no buyers. In the last two years the owner has received one thousand dollars for the apples on the trees, with no cost to him for picking or packing, and he has just found out that the lake shore is the place to raise fruit with profit; and now he declines to sell, but thinks of setting out the balance of the eighty acres to apple trees. He lives some twenty miles from there on a farm that cost him ninety dollars per acre, and I will venture to say he does not clear five per cent. on his home investment, while ten acres of the eighty on the lake shore, pay him twenty-five per cent. on the whole farm.

St. Joseph has nearly discontinued peach raising for the reason that the borer and curculio are such obstacles to success that the cost of producing is more than the fruit will bring; but apples, pears, plums, cherries, and all the small fruits are a success. If I were to engage in fruit-growing in that section, I should turn my attention chiefly to apples, pears and quinces, as they require the least care, and are much more profitable in view of the money and labor expended, where lands can be bought so cheap. The small fruits are never a failure with the exception of blackberries, and those have only failed once during my sojourn of fourteen years there. Strawberries produce from three to six thou-

sand quarts per acre, and the box manufacturers of St. Joseph will furnish you with sixteen-quart boxes and an outside case to pack them in for fourteen cents—less than one cent per quart. Peach baskets, also used for grapes, sell for from five to seven cents each.

As regards the country: it is all that can be required in the way of churches, schools, railroad facilities, etc. It is within four hours' ride, by rail, of Chicago, the metropolis of the west, whose daily morning papers reach there in the forenoon. The land in this locality is very good farming land. Parties living on it and cultivating it as it should be cultivated, will raise about as much as on the high-priced land of this State, so that men of small means who have money enough to make their first purchases and buy their trees, need not think they will have to wait for bearing orchards before receiving any income, for most of this land is in partial cultivation, and with industry they can more than make a living.

The lands held at twenty-five dollars per acre have usually comfortable buildings, and a good part of them are cleared, so there is no extraordinary outlay to get a place to live in after purchasing the land. Grain and stock are shipped to New York and Boston by rail about as cheaply as from western New York, and prices are about the same. LUMBERMAN.

Horticultural.

GARDEN TALKS AND WALKS.

THE BEECHES, May 25, 1878.

THE past winter was exceptionally mild, but a few cold snaps and the surface wetness of the ground were detrimental to some plants; in fact, altogether, hardy plants suffered more during last winter and early spring than they did the previous one. The spring opened unusually early, and excellent working weather has been the rule since early March. We have not had much hot weather so far; on the contrary it has been somewhat cold; nevertheless herbage and shrubbery are in growth considerably ahead of what they were this time last year, but forest trees are not much if any in advance.

A few cold mornings, a week ago, did considerable damage to strawberries and early vegetables in some neighboring localities, but right round here no perceptible damage has been done. There is every probability of an immense fruit crop, and vegetables look thrifty and flattering.

We have had a long period of labor in tarring our apple and elm trees to prevent the ascent of the canker-worm grub; we have been at it from last October till April. We tack a strip of tar-paper, about a foot wide, round the stem of the tree, and paint the paper every second or third day with a paint made of printers' ink and some cheap oil. This being wet and sticky, the grubs cannot pass it. Some people have zinc troughs fixed around the trunks of the trees and which are filled with crude oil. I prefer the tarring system though the troughs are certainly the least troublesome. The grubs were unprecedentedly numerous this spring. Gooseberry caterpillars are at work, but dry hellebore powder dusted on them, destroys them. Aphides, too, in many places are at work, but timely and frequent syringings of a weakly wash made from a solution of whale-oil soap and tobacco juice, applied to Roses and other subjective plants, have, thus far, kept the vermin outside our gates. The mildness of last winter is likely to be severely felt during the summer months in the multiplicity of the bug family, many plump and vigorous representatives of which have been exposed to light during the winter and spring, when we were digging, plowing, and turning over manure and compost heaps, and the potato gentlemen were the most numerous of all.

On account of the prevailing cold weather "bedding out" is not so forward as it was this time last year. Echeverias, Feverfew, and the hardier plants are being unreservedly planted, but we delay to plant out Alternantheras and the more tender things, for nothing is gained by committing tender plants to a cold soil. But we can help matters greatly by so hardening off our stock that neither sun nor exposure can hurt them after we do plant them.

About the first of June we usually turn our Palms, green-leaved Draceenas, Ficuses, etc., out of the glass-houses on to the terrace in front, and as we have no means of shading them from sun, the leaves generally got a little browned. By ventilating day and night for a month ahead, we greatly alleviate the evil that might be. Were the plants movably small, we would remove them from the green-houses to under the shade of trees for a little while before fully exposing them, and thus secure perfect immunity from scalding.

Notwithstanding the beauty of tender plants we have a passionate fondness for hardy ones, hence a varied and extensive collection of them. As I have encroached so much on your space already I will only mention a few of our choicest specimens now in perfection:

TREES.—Fraser's Magnolia, the Yellow Cucumber Tree, Judas Tree, Flowering Dogwood, American Black-thorn and English Hawthorn.

SHRUBS.—Rubus deliciosus, Exochorda grandiflora (magnificent), Lilacs, Tartarian Honeysuckle, Snowdrop Tree, Calycanthus, Kerrias, Spiræa obovata, prunifolia and hypericifolia, Azalea Pontica, mollis and undiflora, Pyrus arbutifolia, Daphne Cneorum, Rhodotypus Kerrioides, Nevinsia Alabamensis and some of the earlier-blooming Rhododendrons.

HERBACEOUS PLANTS. — Stellaria Holostea, several kinds of evergreen Candytuft, Columbines in great variety, European and Asiatic Globe-flowers, Anemone Pulsatilla, Bleeding-Heart, Pursh, Shooting-star, tree Pæonias, Polemonium reptans and carneum, 21 kinds of American Violets, Cypripedium parviflorum, pubescens, candidum, arietinum and acaule, Armeria vulgaris, Irises in variety, round-leaved Saxifrages, Golden Corydalis, Fire-pink, early Phloxes as subulata, reptans, amœna, and divaricata, Ten-o'clock, Soleman's Seal, Sedum ternatum, Saponaria ocymoides, Vesicaria utriculata, Doronicum Caucasicum, and many others. The first rose of the season is Rosa acicularis, a Siberian species.

Among vines, the Pipe Vine has been in bloom since some time, Wistarias and Akebias are at their best, and the Matrimony Vine is full of little blossoms. As a finely colored foliage shrub, Acer polymorphum dissectum has no seasonable equal; its leaves are deep crimson.

MASS.

PLANT STRAWBERRIES EARLY.

WE occasionally are advised to set Strawberries early, and thus procure a partial crop the first year.

The advice to set as early as the land is in good condition, is sound, but what fruit one gets the first year is at the expense of the future crop. Better cut off all the blossom buds, and thus throw all the strength of the roots into the growing plants. This "first" crop will at best be light and inferior. Have patience until the second year, and you shall have your reward.

NELSON RITTER.

[THE above with several other valuable timely articles was mislaid, for which we apologize to our valued contributor.—EDS.]

EXTRACTS FROM CORRESPONDENTS' LETTERS.

THE KITCHEN AND FLOWER GARDENS IN THE FAR SOUTH.

HARRIS CO., Texas, May 19.

WE are badly in need of rain here. We did not have any good soaking shower for three three months. While the field crops are not seriously hurt as yet, by this dry weather, its effects are felt in vegetable and flower gardens. The first green corn is sold in market. Of this, for the table, gardeners generally plant only the common field varieties. The taste of Texans is not, as yet, brought to such a fine point as to esteem and give due preference to the improved sugar varieties. It is quite different with tomatoes: when in their season, nothing short of a fine-grown Trophy is salable. But, unfortunately, this season is very short; even young plants refuse bearing during the hot days after June. A tomato that would keep bearing through the whole of summer would be a boon. Hitherto we have none that comes up to this requirement.

Of all the different varieties of melons that come to this market in their season, I consider the Peerless the best in many points. The so much lauded Gipsy is nothing but a coarse-meated, over-grown monster, handsome to look at, but insipid and stale to the taste.

The onion crop is made; and one that looks at some of these monster bulbs — sometimes measuring six inches through, would be at once convinced that as good and large an onion may be grown here, in one season from the seed, as in any of the New England States. Wild dewberries and blackberries have been peddled round in large quantities since the last week of April. It is the colored population that monopolizes this industry. There is no prospect for a small-fruit culturist here. These berries go directly from the picker to the consumer; they sell at five cents per quart and will, before the season is gone, come down to about half this price. Chickasaw plums are ripening; this is the only cultivated species of this fruit, that will bear here. Judging of the great variation in taste, size, color, form and adhesiveness of stone manifested in seedlings of this plum, it undoubtedly would by proper selection be susceptible of great improvement.

Gladioli are in full bloom; they are rather impaired by the unusually dry weather they had through the whole period of their growth. Cape Jessamines are loaded with flowers. This is the flowering bush, *par excellence*, of Texas. It takes about the same rank among shrubs here, as the Lilac does in the Northern States. It is, after the planting of a rose-bush or two, the first thing used to adorn the door-yard even of the humblest cottage. Sweet Myrtles are just through blooming. Magnolia grandiflora, the queen of broad-leaved flowering evergreen trees, is in its full glory, exhibiting its grand fragrant flowers in profusion. These trees continue to bloom from three to four months constantly; much to the delight of a horde of sable urchins, who created quite an industry by picking the magnolia buds, arranging about half a dozen to a bouquet and wrapping them up with a little gray moss; in which shape they are sold to railroad passengers coming from localities where the Magnolias do not exist. G. MARTI.

BLOOMINGTON, Ill., May 24, 1878.

How pitiful the ravages of tigers and serpents in Asia, and from wolves and bears in Europe! What sort of people can the inhabitants there be that give up to such pests—and why don't thousands of our American and English and German hunters emigrate there and *clean 'em out?* W. P.

Floricultural.

LOBELIA FROM SEED.

W. C. L. DREW.

A COMMON complaint among amateurs is the difficulty of germinating Lobelia seed. Many fail in raising these plants, who are successful with much more delicate subjects. The reason for this failure is not far to seek. Those having experience with fine seed, usually call into use the aid of a hot-bed or cold-frame. The results may readily be anticipated: Cinerarias, Calceolarias and such like, being subtropical plants, thrive; Lobelias fail. The fact is Lobelias are almost hardy plants. The seed will germinate fully in a temperature a few degrees above the freezing point. Consequently if sown in the close, moist air of a hot-bed or cold-frame, the seeds vegetate quickly, and also "damp off" almost as soon as up. Thick sowing also favors damping off. Thus between thick sowing and an excess of heat and moisture, Lobelia seeds too frequently fail to produce a crop.

The proper method is to sow the seed thinly in well-drained pots or pans and place on a shelf in a cool greenhouse, or in some cool, lightsome situation. The soil is of secondary importance, one composed of equal portions of leaf-mold, garden soil and sand suits admirably. The pot or pan need not be more than half filled with soil, drainage occupying the balance of space.

The seed is very fine, and should never be covered, but merely sown on the surface and pressed in with a smooth board. But little water should be given until they commence to grow freely. Lobelia seed can be sown at any time by placing in a cool place. Some prefer to sow in October; others in April; any time from October to April is to be preferred to later in the season. As soon as the seedlings can be handled, they should be pricked out into pans or pots, setting an inch apart. Early plants grow stronger and bloom sooner and more profusely than those raised later in the season—but do not hurry the Lobelia. Queen Victoria, Blue Stone, Emperor William, are popular varieties.

El Dorado, Cal.

Entomological.

HELLEBORE AND THE CURRANT-WORM.

T. H. HOSKINS, M. D.

I FEEL obliged to demur to Mr. Mann's statement that "the most certain, economical and safe" way of destroying currant worms is to pick them off. There are many plantations of currants and gooseberries, near our large towns and cities, of an acre and upwards in area. If we were compelled to depend upon hand-picking, the business would have to be abandoned on account of the cost, besides being so imperfectly done as to be very ineffective. Upon a few bushes, by a careful gardener, it is practicable; but even in such a case the proper use of hellebore is preferable.

But it seems very difficult to get into the public mind the proper use of this invaluable insecticide. It is an active drug, it is true, and a "poison" just as tobacco is a poison, and no more active upon the human system. There does not seem to me any probable, hardly any possible way, in which the use of it for destroying currant-worms can inflict serious harm upon any but the worms themselves. Used as by those who understand the quickest, simplest, cheapest and most effective way of applying it, there is no need of even causing a sneeze.

That way is simply thus:—Have a ten-quart sprinkler with a moderately fine rose; into this put as much of the pure powdered hellebore root as can be taken upon a large table-spoon. (In my currant plantation I carry the hellebore in a covered tin-pail, to prevent waste by the wind, and have with it a horse, a stone-boat, and a barrel of water). Add to the hellebore in the sprinkler a quart of water, and "slosh" it around until it is well mixed. Then fill up the sprinkler, and quickly and lightly, yet thoroughly, wet every leaf of your currant and gooseberry bushes. Sprinkle from the outside of the bushes, all around, turning the rose toward the center. In this way you wet without waste.

The time to do this is when the bushes are just beginning to go out of bloom. A dry day should be chosen, and if properly done, with good hellebore, only one general application is necessary. The first brood is so completely destroyed, before it has time to inflict injury, that it is hard to believe that there were any there, unless you have looked for and found the eggs, and the little holes made by the worms before they scatter. The hellebore left on each leaf by the drying of the water remains all summer in full efficacy, with slight exceptions here to be noted. Of course, the leaves that come afterwards do not have it; but any second or third brood does not spread far before reaching leaves that do have it. And under the drip of the trees it is washed off. It is only in this last case that I ever have to make a second application, and I do not propose to grow my currants and gooseberries under trees hereafter. It is possible that very heavy and long-continued rain may sometimes have a like effect, but I have had no such experience in 14 years. The powder sticks tightly, to the hairy currant leaf especially, when it has once dried there.

It is entirely unnecessary, as many direct, that the hellebore be applied to the under side of the leaf. The worm eats clean, takes the whole leaf, and will get his dose as well from one side as the other. Applied at the blossoming season, no hellebore adheres to the fruit, as there is no fruit to adhere to. I think there is no danger at other times, as I have never been able to make it adhere to the smooth skin of the berry. Even if it did, the portion that would reach the berries when applied as above directed would be so small that an eater would kill himself eating currants long before he got enough hellebore to hurt him.

Industrial Topics.

OPENING OF THE FRENCH EXHIBITION.

PARIS, May 20th, 1878.

ALTHOUGH the weather was bad, the work in the Exhibition incomplete, and the arrangements for the *fete* a trifle defective, still the opening ceremony on the 1st of May was certainly a success. The threatening clouds did not prevent the light-hearted inhabitants of the gay French capital from turning out in tens of thousands to take part in the festivities; and every approach to the Great Show was crowded with spectators on foot and in carriages, while the building itself and the surrounding grounds, were thronged with those fortunate enough to have obtained tickets of admission to witness the proceedings of the day. From early morning the whole city was dressed in holiday attire, banners and draperies were displayed in every direction, while the illuminations after nightfall were universal and, in many cases, extremely brilliant.

Shortly before two o'clock in the afternoon, Marshal MacMahon, the Prince of Wales—wearing a field-marshal's uniform—the Crown Prince of Denmark, Don Francisco D'Assisi of Spain, the Duke of Aosta, Prince Henry of Holland, and the Grand Duke of Lechtenberg, together with the foreign ambassadors, the high functionaries, and the senators and deputies, assembled in the Reception Hall of the Trocadero. When all had arrived, a move was made to the platform on the garden front of the building. Here the Marshal was greeted by M. Teisserene de Bort, Minister of Agriculture and Commerce, who read an address, at the close of which the Marshal stepped forward, and in a loud voice exclaimed: "*L'Exposition est ouverte!*"—the Exposition is open—and at the same moment the guns of the distant forts boomed a salute, the magnificent cascade and fountains poured forth a sparkling flood, the band of the Garde Republicaine struck up Gunod's "*Vive la France*," and a sharp shower, the third that morning, drenched the admiring crowd.

Then was formed the procession to visit the main building across the river on the Champs de Mars. First came the Prefect of the Seine and the Prefect of Police followed by hussiers; then came Marshal MeMahon, with the Prince of Wales on the one hand and Don Francisco d'Assisi on the other, and abreast of the Marshal, the presidents of the Senate and Assembly, jealous that the Executive should not on such occasion be more prominent than the legislative departments of the government. After them walked a score or so of Princes and Grand Dukes, followed by Mr. Krantz, under whose charge the Exhibition was erected, together with many Commissioners of foreign countries.

Descending the steps, the *cortege* passed across the Bridge of Jena to the Vestibule of the Street of Foreign Nations, where the Marshal and his guests halted, while, amid torrents of rain, the various Commissioners, in every variety of national costume, hurried forward to the ir respe

tive sections in order to be ready to receive the Marshal on his round of inspection. Presently MeMahon and his suite again moved forward along the Street of Foreign Nations, pausing at each section to congratulate the Commissioners, and, finally, after visiting several French industrial sections, he quitted the building amid loud cries of "*Vive la Republique.*" The foreign princes were escorted to their hotels by detachments of cavalry.

After the procession had passed through the Foreign Sections, the gates were thrown open to the public, and the "Opening of the French Exhibition" was a thing of the past. TREBER.

Dairy Husbandry.

CHAUTAUQUA COUNTY BUTTER DAIRYMEN.

CHATAUQUA CO., N. Y. May 26, 1878.

CHAUTAUQUA County, situated in the western part of the State of New York, is not so much of a grain-producing, perhaps, as a dairying section. In the way of manufacturing fine butter and cheese, we think it only excelled by Orange and Herkimer Counties, which are probably the largest in the State. Chautauqua dairymen are enterprising and each one tries to excel his neighbor in the art of *fine* butter making. Many farmers keep an extensive dairy of cows, their butter receipts alone amounting to quite a large sum during a season. Farmers are becoming awakened to the fact that a good cow can be kept as cheaply as a poor one, while the yield of milk and butter is much greater. Much fine stock is therefore being raised, and only calves from the best cows are kept, which is good economy.

On account of the low price of butter at present, however, several dairymen have abandoned the idea of butter making and have gone into the manufacture of cheese, and a number of new factories have been started. Others still continue butter making believing it will ere long be in good demand and bring a fair price. Chautauqua County butter is generally known as A. No. 1, and in most cases it is sold at good figures in market.

Were it not for the butter and cheese product some farmers would find it a difficult matter to obtain a livelihood from off their farms. Scarcely any grain is raised but what is consumed at home, while a large quantity is imported from the great grain producing sections of the West, and this is quite a heavy item of expense during the year. Improved thoroughbred stock is being constantly added to the dairy of cows, and many believe that it pays to keep only the best.

Within the past few years, fruit growing has become quite an important part of farm industry, the apple crop of Chautauqua County amounting to several thousand dollars, last season—a great help to farmers in these hard times. The low price of butter this spring, together with the prospect of a small crop of hay, has given many farmers the blues, although really they have little reason to complain.

It is generally believed that as good an article of butter and cheese can be produced in Chautauqua County as anywhere, and more and more is being produced each year, thus inaugurating an important branch of industry.

M. L. DORMAN.

Industrial Implements.

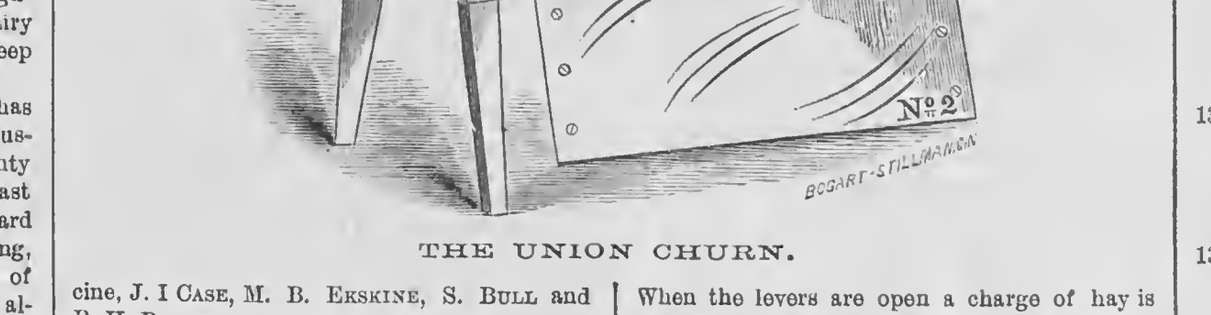
THE CASE WORKS.

THE magnitude of the interests involved in the manufacture of farm machinery is strikingly illustrated in a single instance,—the threshing machine works of Messrs. J. I. CASE & Co., at Racine Wis. The illustration shows the works as they are to-day—the chief feature of Racine's extended industries, and probably the largest threshing machine establishment in the world.

The products of the Case works sustain the highest reputation, and the demand ran up to eighteen hundred and forty-five threshers last season, not to mention horse-powers and one hundred and nineteen steam engines, which latter item will run over two hundred this season. Mr. CASE commenced business in 1842 in Racine and has continued steadily in the same occupation to date. As the transactions of the firm grew, partners were added, Mr. CASE always selecting gentlemen who had been in his employ, thus securing the kind of talent and energy that was best adapted to the business.

Details give, perhaps, the best idea of what a large establishment it requires to turn out eight complete threshers, and horse-powers per day; and annually two hundred threshing engines, one hundred and fifty thousand dollars' worth of repairs, besides over two hundred heading machines for the Pacific Coast—to which the State fair of California awarded the Gold Medal.

Upwards of 400 men, with a pay roll of $20,000 per month; with shops and warehouses covering 15 acres; involving a capital of over $2,000,000; consuming yearly 1,000, tons of iron 3,000,000 feet of lumber, $50,000 for belting, $25,000 for paint, $50,000 for freight, $20,000 for printing and advertising, $2,000 for postage stamps; with over 400 agencies, extending throughout the breadth and length of the land are the items that command the time and attention of the four representative men of Racine, J. I CASE, M. B. EKSKINE, S. BULL and R. H. BAKER.



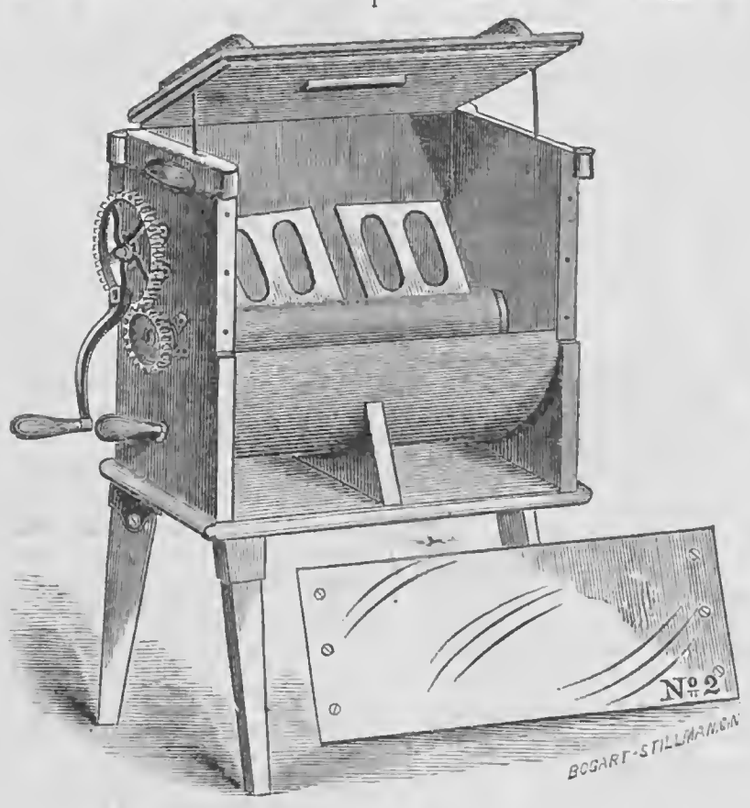
THE ERTEL PRESS.

THE ERTEL PRESS.

MR. GEO. ERTEL of Quincy, Ill., has invented a portable, economical press, adapted to pressing hay, straw, moss, etc. The aim of the manufacturer seems to have been to crowd into the smallest compass the most simple and effective machinery adapted to the work. The result is that the "Economy" press operated by a man, a boy and a horse, will perfect upwards of sixty bales of hay in ten hours—bales running from 175 to 220 pounds. The strong features of the press are its simplicity, portability, compactness, light weight (about 3,000 pounds) and low price.

Those having to do with the hay crop know that an attractive package has an additional value above the worth of the material; at least it is so in the New York markets. Consequently a press that meets its maker's claims to being always ready for work within itself; that can be moved from stack to stack quickly without waiting on steam or horse-power apparatus with which to operate it; that is worked without gearing calculated to multiply friction, and that permits of the operator attending to his duties without the aid of platforms and other cumbersome, stationary contrivances, is a desirable piece of agricultural machinery.

The illustration shows the construction, and position of the press when at work. The levers are drawn in with a chain that is fastened to the power, working direct without pulley or sheave. One horse is hitched to the end of the sweep, and when pulling to the right opens the press, and shuts it by reversing the draft to the left.



THE UNION CHURN.

When the levers are open a charge of hay is placed in the press, and a door shut which locks itself as it closes. This right and left motion of the horse is repeated until the bale is of the proper dimensions, when it is wired and thrown out and ready to be packed in a car. A box car will contain from 110 to 125 bales. The size of the bale in press is 19-23x36 inches—a convenient size.

The "Economy" commends itself for the features above enumerated, and the fact that it has successfully stood the test of practical hard work. Mr. ERTEL will send circulars and complete information to those who desire them.

THE UNION CHURN.

Of the making of churns, like the making of books, there is no end, and it is well that it should be so. The most hopeful sign of civilization is a man paying his debts, and buttering his bread. To have butter worth the name one must use a good churn. Such an one is the "Union" made by the Tiffin Union Churn Co., Tiffin, Ohio. The illustration we give needs no letter-press explanation. The "modus of the operandi" as has been said, is apparent.

A word concerning the company: SHAFFEL & BALDWIN in 1864 commenced making this churn in a small way, and had hard work introducing it to a prejudiced public. They kept right on, and in 1875 sold out their interest to the present company of which A. C. BALDWIN is president. The extent of the business has commanded new and spacious brick factories, and at the present time there are upwards of sixty thousand of these churns in use. These figures are more convincing than words. Circulars may be had by writing to the company.

RUSSELL AND CO.'S THRESHER.

THE Improved Thresher turned out by RUSSELL & Co., Massillon, Ohio, should command the attention of large farmers and threshermen. It is very simple in construction, has few parts subject to wear, does not require exceptionally skilled men to run it, and does satisfactory work in the large as well as the small grains.

Its capacity is about one hundred bushels of wheat and two hundred of oats per hour; and its claim to superiority the ease and small cost by which this gratifying result is obtained. As a thresher is not so easily procured as a mower, for instance, it needs no suggestion on our part to those intending to invest, that it is well to look before leaping; and the way to do it is to get all the circulars and information procurable before deciding.

Various.

CONNECTICUT AGRICULTURAL EXPERIMENT STATION.

NEW HAVEN, June I, 1878.

Bulletin No. 14.—Fertilizer Analysis.

132. PINE ISLAND GUANO. Manufactured by Quinnipiac Fertilizer Co., New Haven. Claimed 4 per cent. Nitrogen, 3.5 per cent. soluble and reverted Phos. Acid, 2 per cent. Potash. Sampled May 13, by E. H. Jenkins, from lot in transit to purchasers.

137. STOCKBRIDGE FORMULA FOR CORN. Manufactured by W. H. Bowker & Co., Boston, Mass. Claimed 5.75 per cent. to 6.50 per cent. Nitrogen, 3 to 4 per cent. soluble Phos. Acid, 6 to 8 per cent. total Phos Acid, 7 to 8 per cent. Potash. Sampled May 22, by Andrew's Bros., Southington.

139. E. F. COE'S AMMONIATED SUPERPHOSATE, from J. B. Barstow & Co., Norwich. Claimed, available Phos. Acid. 9 to 11 per cent. Nitrogen, 2.1 to 2.9 per cent. Sampled May 24, by J. B. Barstow & Co.

134. MURIATE OF POTASH, from stock, of Geo. W. Miller, Middlefield. Sampled May 7 by R. S. Hubbard, Middletown.

138. MURIATE OF POTASH, from Mapes' Formula and Peruvian, Guano Co., New York. Claimed 5 per cent. Potash. Sampled May 22, by John S. Kirkham, Newington.

136. IVORY DUST. Sampled May 22, by L. J. Platt, Deep River.

140. PETER COOPER'S PURE BONE DUST, from G. H. Glover, Branford. Sent May 14, by Killingworth Farmers' Club.

	132	137	139	134	138	136	140
Nitrogen	4.35	5.89	2.35			1.37	1.41
Soluble Phos. Acid	1.28	2.01	8.60				
Reverted	1.65	3.35	0.76				
Insoluble	1.25	1.53	1.91			12.43	26.10

Moisture						10.64	
Calculated value	$34 01	46 37	34 94	36 62	47 74	22 33	41 62
Cost	$42 50	50 00	38 00	45 00	+38 00	‡	30 00

* Potash is valued at 7¼ cts. per lb. and evidently too high.

** Potash is valued at 4¾ cts. per lb. In 138 potash costs 3 6-10 cts. per lb.

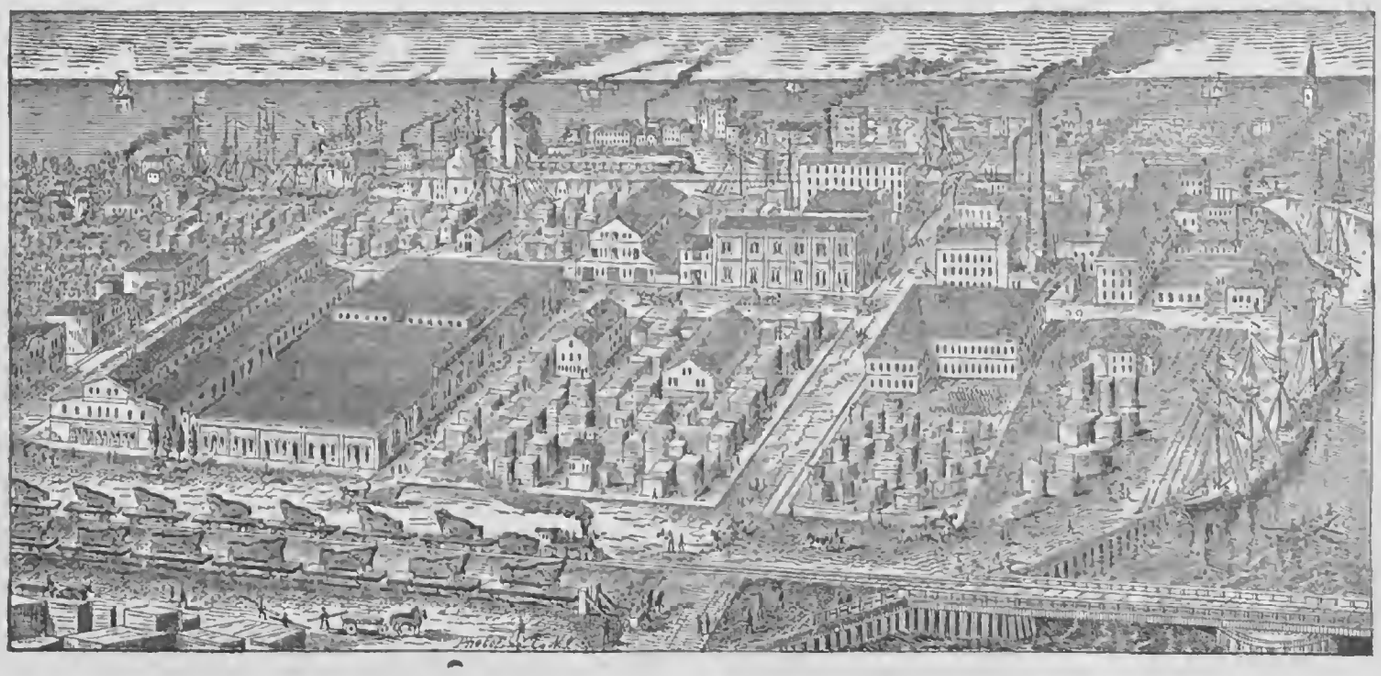
+ $38 00 in N. Y., $40 00 in Hartford.

‡ Is considered worth half as much as bone-dust.

S. W. JOHNSON.

FOR a farmer to get rid of all his money, we know of no way more certain than for him to buy a stock of dry goods and then attempt to sell them. This mode of procedure is both quick and sure. We have seen many instances of this kind and it has not generally taken over six years—sometimes less, rarely more. None but trained experts and those with a natural taste for the business can permanently succeed in selling dry goods. If this can be called experimental agriculture, we may add that there is no more need of repeating the experiment.

IN the use of bone manure it is well to bear in mind that the more finely it is pulverized, the more quickly it acts. The effect of finely ground bone may not be noticeable for more than two or three years, but a quick return for the capital invested is made. Coarser bone may be far less observable in its effects upon crops, but of course, those effects will continue much longer.



THE WORKS OF J. I. CASE & CO., RACINE, WIS.

The Querist.

QUERIES ON DISEASES OF CATTLE.

ANSWERED BY D. E. SALMON, D. V. M.

Stomach Ailments.

G. Penrose, Westchester Co., N. Y., says:—The past week one of my cows and a yearling heifer refused food. I called in a veterinary surgeon, who, discovering that there had not been for some time any action of the bowels, prescribed purgatives. These were given, but with no effect, the calf dying the following day in great agony. In order to ascertain if possible the cause of death, I had the calf cut open, but the surgeon evidently being out of his element, as he apparently knew no more of the matter than I did, could not determine the cause of death. The heart, liver, lungs, and small intestines seemed in a healthy condition—the first stomach was much distented with food, the others apparently healthy save the last—of this, the membrane dividing the interior of it, was parched up and broke readily at a slight pressure, as if rotten, while the contents were as dry as if the matter had been expelled for days. Pray inform me, through the columns of your paper, whether I have described the normal condition of this stomach, or if it became so from disease, and the name of the disease.

The cow died the following night. I had at first thought that these animals gained access to some paint that was in the barn, but no trace of this could be found in their bowels, nor did they seem to suffer from thirst; a symptom always accompanying, so I understand, poisoning.

ANS.—It is probable these animals were affected with impaction of the third stomach, sometimes called grass staggers. It is often caused by a sudden change from dry food to grass; it may also be caused by feeding on dry, indigestible food, by a deficiency of water, and by lead poisoning. The stomach spoken of as the last, was probably the third or manifolds, the contents of which are always found in a dry, hard, caked condition in this disease. The epithelial lining of the first three stomachs is readily removed in large pieces, in all cases where there is congestion of the mucous membrane of these organs; and even the membrane of the fourth stomach may be softened by congestion or inflammation. Purgatives (Glauber or Epsom salts with common salt), and stimulants (Ginger, Turpentine, Nux Vomica), accompanied with injections, with counter-irritants when there is much irritation of the stomach, should be used as treatment.

Glanders—Heaves.

Van, Brown Co., Wis., says that one of his neighbors lost a horse lately by a disease about which opinions in his neighborhood differ. She was sixteen years old and had had the heaves for a long time; she had refused oats or any feed but hay for about a week or ten days; had breathed with difficulty, a sort of pant, with now and then a long breath like a warm, tired dog; a thick, yellowish discharge ran from the nostrils all the time. 1. Was it glanders? 2. He has a horse eleven years old that has the heaves slightly, and he asks what can he do to cure him?

ANS.—1. This horse may have had glanders, or the discharge might have been caused by simple bronchitis; there is often a discharge from the nose in connection with the heaves. It is, therefore, impossible to decide as to the nature of this disease without knowing whether or not the peculiar symptoms of glanders were present. In all cases where glanders is suspected, it is the duty of the owner to have the animal examined by a competent practitioner; and in case the animal is thus affected, it should be destroyed at once. Glanders is one of those fatal, contagious diseases, which is not only communicable to other animals, but even to people; and it should be understood by the owners of glandered horses that, in keeping them, they are exposing themselves to the contagion of a disease which, if contracted, is no less fatal or horrible than hydrophobia itself. Glanders is diagnosed from the peculiar, sticky character of the discharge from the nose; from characteristic ulcerations of the mucous membrane of this part; and from the hard, nodular, enlarged condition of the lymphatic glands under the jaw. It is absolutely incurable, and its treatment should never, under any circumstances, be allowed.

2. Perhaps the best treatment for this trouble is a run on natural pastures. If the animal must be kept in the stable and worked, it should be fed on oats and roots, (particularly carrots), with a very little of the best hay and that given at night, and a limited supply of water. The greatest care should be taken to have the animal in the open air as much as possible, day and night, or at least to have the stable *thoroughly* ventilated.

Wintering Dahlia Bulbs.

J. W. G., asks how best to winter Dahlia bulbs. She had them in a cool place, but they would dry up and become hard, or else mold and rot. They were raised on very rich ground and grew large and thrifty.

ANS.—Take them up after light frosts, wash and dry. Place them in sand and keep in the cellar. We think there will be no further difficulty.

New York Steamship Companies.

Edwin Hope, Geauga Co., Ohio, asks for the names of the chief steamship lines sailing from this port.

ANS.—Foreign Lines: Cunard, White Star, Williams & Guion, National, Inman, State, Anchor, North German Lloyd, Hamburg, French, White Cross.

Coastwise Lines: Pacific Mail S. S. Co., C. H. Mallory & Co., Clyde, Morgan, Alexandre, Murray, Ferris & Co.

An Ice-House.

Jas. Kyger, Clinton Co., Indiana, says: I built me an ice-house and milk-house combined, last fall. It is built 10x15 feet, out of rock, with a board partition in the middle—the front for milk, and the rear for ice. The milk-house part is about eight feet deep inside; the ice-room six feet. I didn't get any ice to put up last winter to try it. Now, I want to ask if it would be best to plank the floor of the ice-room, or just put the sawdust on the ground sloping towards the milk-room. I have a good tile-drain from the bottom of the milk-room, and I put in gravel and laid the floor with brick. The entrance to the ice-room is at the north side, and to the milk-room 'tis at the east. The milk-room is about four feet below the ground and the ice-room two feet below.

ANS.—By all means, we should plank it. Sawdust, when packed too hard, loses much of its non-conducting power.

Beans.

E. L. C., Skaneateles, N. Y. asks, whether beans yield better sowed in drills or planted; 2, what is a good fertilizer for beans.

ANS.—Pole beans we think will yield as well if planted in hills; the dwarfs will yield more in drills. Potash (ashes) is the best special manure.

Bone Fertilizer.

Rural Reader, Blackstone, Ill., asks, 1. the difference between superphosphate made from raw and burnt bone; 2. how bone-black is made; 3. the difference in nitrogen between the shank and rib bone.

ANS.—There is no ammonia in burnt bone. Otherwise it is nearly the same. 2. Bone-black is obtained by grinding the product of bones burned in a close vessel at a red heat. 3. We do not know.

Miscellaneous.

Frank H. J., Warren Co., Va., asks the name of a reliable work on farming generally, including diseases of cattle, etc., for the purpose of canvassing the local agricultural community for it, in connection with other books and periodicals.

ANS.—We would refer him to The Orange Judd Co. of this city. They sell all such books; we sell none except the RURAL.

Everywhere.

HERDMEN'S LIFE ON THE PLAINS.

ELBERT CO., Colorado.

THE traveler on his way across the plains by the way of the Kansas Pacific Railroad, suddenly opening his eyes in the morning, finds himself on the Great American Desert. He is amazed at the vast extent of country rolling on and on like a great ocean, with nothing to break the monotony. He cannot realize that there are people living here a life as full of interest to them as the life he lives in the East is to him. But were he to leave the train and take one of the horses he sees hitched to a post at the little way-side station, and canter across the prairie to a little ravine where there is water to be had, he would come upon a scene as full of life and interest as any he had left behind.

It is the midst of the "round-up" season and one has just come in. The visitor will not find a man that has time to speak to him, but he will probably hear one cow-boy call out to another. "There comes a tender-foot!" It is almost night and the boys are tired and hungry, but the cattle must be corraled before dark, and if the stranger does'nt keep a tight rein on his horse, it will join in the chase after that refractory steer that has broken loose from the herd, and with head down and tail erect gives promise of a fleet race, but he is soon headed by an expert rider and brought back.

The horses know their business so well that if a beast breaks away from the herd, almost before you are aware of it, your horse is after it. By keeping the herd closely surrounded and pushed forward, the head ones finally make a rush for the corral gate, when all the rest follow. Then the cow-boys start for the ranch and supper. But how rough and dirty they do look in their leather over-alls and their sombreros slouched over their sunburnt faces, and their spurs clanking at every step! Their first care is to loose their long lariats from their saddles and stake their horses where they can get good grass. Then they go for the pump and should there happen to be a lady at that ranch, there will be a lively time with wash-basin, towels, and combs, and a few minutes afterwards you would scarcely recognize them as the same men. They come in polite and affable, and if they see that the lady of the house is busy caring for their comfort, they go right in and help her to wait on table and wash dishes or cook; for it is a rare thing to find a cow-boy that cannot cook.

Early next morning the branding is to be done, and soon there is a big fire out at the corral, but you will not enjoy seeing the hot irons put on the poor struggling calves. The cattle are started to running around the corral; then the rope whirls through the air and settles on the neck of the victim, and often when the cow hears the cry of her calf, she makes a dive at the men. Then there is a scramble for the corral fence; and if you are where the "tender-foot" generally is—on the top of the fence out of danger—you will have a good laugh. Sometimes the cow becomes boss of the situation; then some of the boys mount their horses, go in, and driving her into one corner, hold her there until her calf is released. The cows will not attack a man on horseback.

As soon as the branding is done, the boys are off to another "round-up" and by that time, if business is not driving, you will not want to return and take the next train, but will join the boys; and if you do, make up your mind to take all kinds of weather, faro, and jokes in good humor, and do not put on any airs of superiority over the cow-boys; for you are no better out here than they are and if they think you are putting on airs, they will persuade you to mount on a bucking horse and you will get your white shirt soiled. N. V. SNYDER.

CROP PROSPECTS IN NORTH MISSISSIPPI.

DE SOTO, MISS., May 26, 1878.

CROP prospects in North Mississippi cannot, at this writing, be described by any one adjective, unless it be the word "various." Wheat, which is now nearly ready for the scythe, is seriously injured by rust—an appearance of disease produced by a minute insect, which absorbs the juices of the plant, causing it to dwindle, fall down, and fail to perfect its grains. Oats look promising, and clover patches are luxuriant. Farmers here plant such things as clover, chufa and buck-wheat only in patches. Cotton and corn are the main crops—the cereals are put in as more accessories, and always allotted to the poorest parts of the farm. Corn is now knee-high and doing well.

Cotton being the money crop of the country, a large area is planted; and it is now being chopped to a stand, not yet making much of a show. I know of no crop that pays so well for a small investment of labor and space as clover. In this country, if planted in early spring, the farmer may graze his cows, calves and other stock on it, turn them off in a thriving condition in May, leaving the clover eaten down to the ground. It will presently spring up, and be ready to cut by the last of June, continuing its yield, without being reset, for two years.

This is the season of the year when we have pic-nics. The woods are full of wild flowers; the spring waters are cool and sweet, and the temperate air yields just the right proportion of those vital gases necessary to make existence itself a joy. The lads and lasses dearly love to angle in company, and older folks do not disdain the sport so dear to gentle Isaac Walton. The streams hereabouts abound in trout, buffalo and perch. The water is muddy and mosquitoes ravenous; but still people go a-fishing. Give me a fresh RURAL NEW YORKER, and a shady nook at home, any day, in preference.

Gardens are well advanced—squashes, cucumbers and beets abundant. There are plenty of dewberries, blackberries and raspberries. The two former are spontaneous productions. Strawberry season is nearly over. We have had some uncommonly fine ones. My experience is that clean culture is the thing to produce profuse bearing and large fruit. Those vines that we let, by way of experiment, wander at their own sweet will, afford comparatively few.

PERLE PERDUE.

COLD-SNAP DISASTERS.

MUSKEGON, Muskegon Co., Mich., May 22.

UPON us, in this sandy-soil region, Nature smiled with an early and warm spring and a great profusion of blossoms, and barring the fact of excessive flowering—which always breeds suspicion—everything promised a great yield of grapes, tree and all small fruits, and we went to bed on the night of the 12th with but little fears of evil; but in the morning of the 13th Nature put on mourning. We did not, however, feel the full effects of the disaster till the morning of the 15th when the play was encored and strawberry blossoms that were opened, changed the hue of their stamens and pistils to a mourning color, the new growth of grapes hung their heads and the leaves of some varieties of forest trees withered. Still we had little fears of Apples especially the Crabs and other iron-clads, though we could plainly see that Peaches, Plums and Cherries had mostly gone up. But to-day there are strong indications that a good share of the Apples have followed suit, especially the early flowering varieties and those in excessive bloom. These remarks apply only to ordinary aspects, such as level or slightly rolling plains, but do not apply to abrupt elevations affording an unobstructed flow to the cold air as it approached the freezing point; for in all such places I find no damage done, thus offering to the novice a valuable lesson in local climate.

My observations do not extend eastward to the heavier soils where, as we had copious spring rains, I think spring work must be greatly retarded, and where I hear that winter grains are somewhat injured by frost, though promising before, there as here, a full crop. Whatever wind there was in the evening of the 12th, came from the northwest carrying a fog arising from the bayous putting into Lake Michigan from the east to the south side; but before the frost the wind shifted carrying the fog to the north side, protecting all vegetation for some distance in that direction.

Our fruit-growing country is rife with lamentations over this dispensation and threats of emigration are heard, but climatologists reply "You must go to the equator before you are entirely safe from occasional killing frosts." This is but the second time in 20 years that Grapes have been killed here in the spring after the clusters have appeared. S. B. PECK.

KENTUCKY NOTES.

POTATO BEETLE.—FAREWELL!!

WHEN our potatoes, hereabouts, were first coming up, countless numbers of the beetles made their appearance. In fact, it was generally conceded that they were more numerous here than ever before. I was about to purchase large quantities of Paris-green for my own and neighbors' use, when I noticed that the eggs were not hatching, and up to this date I believe that not one in ten thousand hatched.

I have carefully searched my fifteen acres and found less than a hundred young beetles. We all rejoice in the prospect of bidding, at an early day, the potato beetle a lasting farewell.

CORN

Is coming up exceptionally well. In fact we have heard of but one farmer in the "bottom" having to replant, and he left his seed-corn on a floor all winter instead of hanging it up, which may account for his failure. An unusually large acreage of corn is planted here this spring, and many meadows have been planted, in which the corn looks remarkably vigorous.

WHEAT.—RUST.

Notwithstanding the frequent showers and intervening hot sunshine, our wheat is heading finely. So far the rust is confined to the blades, and seems to have checked the growth of the stalk without affecting the development of the head, thus acting beneficially rather than injuriously.

We have heard it said that "the black rust never follows the red rust." Is this correct?

S. E. HAMPTON.

Carroll Co., Ky., May 26, 1878.

RURAL SPECIAL REPORTS.

DOUGLAS CO., Central Ills., May 23, 1878.

AFTER four years of spring rains and consequent failure in crops, we again realize that our hopes, encouraged by an early spring, are blasted, if any thing, worse than on either of the four previous seasons. It's the last week in May and not even much land is broken, to say nothing about planting. The Embarrass river is from bank to bank, and a few fields in its bottoms, which could be gotten in early, by reason of the sandy nature of the soil, are now ten feet under water. There was a large breadth of fall wheat and oats sown, both of which promised, a month ago, a larger yield than we have ever had here; but oats are damaging badly, and whole fields of wheat are "struck" with rust.

As to fruits, we thought, six months ago, apples would be abundant; but to-day, many of those having large orchards, tell me they will have less apples than they have ever had. Peaches are abundant, but the frost, on the night of the 12th inst., blackened a large amount on the upper sides, and these are now dropping off. This, however, will result in good by thinning the crop, which was already two or three times too large. A frost we had about the 1st inst. killed all cherries in bloom, and cherries, generally a large crop here, will be very light, except on a few trees in sheltered localities. Now, I don't think I lost a grape. I have

out twenty sorts; many of them early and tender varieties, but I held them back, as I anticipated late frosts. I have not heard from the extensive vineyards four miles north of me, but my impression is they are badly damaged, since no protection is given during winter and they probably bloom very early. Strawberries are a fine crop. Beans, early corn, tomatoes, squashes, melons, all tender garden truck, have been cut to the ground by the frost.

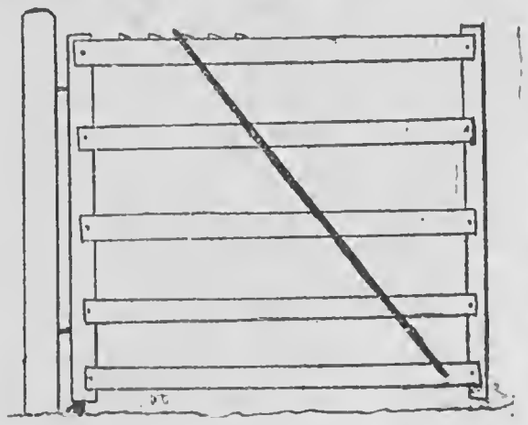
DR. A. C. WILLIAMS.

ROCKINGHAM Co., N. H., May 23, 1878.

THE season has been uncommonly early, and very favorable for doing farm work. During the latter part of April, and first of May, a large amount of rain fell, which gave grass and vegetation of all kinds a good start. Grass never looked better at this time of year. Should it be wet for the next few weeks, the hay crop must be heavy. There has been no rain for the past two weeks; the top of the ground is getting dry. More corn than usual has been planted. Our farmers realize that it is better to raise what they consume, than to depend on buying Western corn. It has been demonstrated to a certainty that corn can be raised at a profit in New Hampshire. Then there is the fodder which is considered worth as much as the average crop of hay cut on the same land. Not as many potatoes will be planted as last year. The low price of last year's crop, with the labor and cost of protecting them from the bugs, has led many to plant only enough for family use. The apple trees are in full bloom; with favorable weather for the next two or three weeks, there will be a large crop. Pears do not bloom much. Peaches did not winter well, and are blooming but little. Low prices for almost everything prevail, yet I do not know but a ton of hay, a pound of butter, or a can of milk will now purchase as much of what farmers have to buy as during the flush times succeeding the war. It is a fact that the farmers are better off than any other class of the community. The barrier between them and abject want is greater than that between it and those engaged in other kinds of business. Could our surplus population be placed on the land where they could obtain their own living, we should hear much less of hard times, strikes and labor unions. W. BROWN.

BERRIEN Co., Mich.

I WOULD like to tell the farmers who read the RURAL, of a cheap and, I think, a very convenient gate for the farm. I made mine 4½ feet high by 12 feet long. It can be made four or five boards high, as one may choose, using a double piece on each end, between which the boards are placed, and using bolts instead of



nails. Then take two pieces running diagonally across the gate, bolting one end to the bottom board; then put another bolt through the two pieces above the gate, cutting some notches, as shown in the cut, on the upper edge of the top board, so that when you raise the gate at the left hand end, these pieces will slide back and catch the bolt in any of those notches. Then you can swing the gate just as you would any other gate, over a snow drift or other obstacle. I use two bolts to each board and two for the pieces diagonally crossing the gate.

Mine works very nicely. I like it better than any farm gate I have ever seen. It is cheap and durable. J. B. RAY.

QUEBEC, May 26.

WHAT a cheerful picture is given us from the Rural Grounds after the frost! It gives me a feeling of wishing to tell of our losses and my own disappointment.

Well, in Canada the Apple trees were white, Currants and Grapes in flower, when one morning the children brought in cakes of ice, to show me. Alas! I could not take it philosophically to lose the best of our fruit, for there is no doubt such is the case. I had planned to be in New York next week, and to go from there to Boston to meet some scientific friends—and spend a week. But I could not speak of it, with the prospects of a poor crop on twenty-five acres devoted to fruit culture, and quietly gave it up. It has been a hope and thought all winter to see the Rural Grounds the last of May, but though "I do not think the grapes sour," I must be content to do without them. A.

PEQUONOCK BRIDGE, New London Co., Conn., May 25.

FOR the first two weeks of this month, March and May seemed almost to have changed places here. Several frosts occurred a few miles back of this place, but no serious mischief was done so far as I could learn. It is warmer to-day. Orchards look well and bid fair for a good crop of fruit this fall. Potato beetles come straggling along and judging from last year, the farmers hereabout will soon have lively times enough with brush and pail among the vines in order to be able to save the crop from complete destruction. Dogs are being registered by the score, and some of our shopmen no doubt make a good thing in selling collars—not rope; more's the pity!—to grace the necks of the worthless, sheep-stealing canines. M. W.

CORNING, Steuben Co., N. Y., May 24.

THERE has been a sudden change in the weather since the opening of May. On the night of the 11th we had a heavy frost which nipped potatoes that were up and also grape vines, which were pushing out rapidly, and all tender plants. Fears are also entertained in regard to the fruit crop being very much injured, which is doubtless the fact; and until within a few days but little corn has been planted on account of the cold, wet weather. Feed is remarkably good and stock has been turned to pasture early. Winter wheat is looking fine and a larger area was sown last fall than usual. Buckwheat sells for 50c.; oats, 30c.; potatoes, 25c.; butter, 16c. and eggs 10c. F. H. D.

SHERMAN, Chatauqua Co., N. Y., May 28, 1878.

AT the present writing the weather is warm and pleasant, and everything is growing finely. Corn is nearly all planted, and the spring's work nearly over. Fruit was badly damaged by the frost which passed over this entire section recently. Cherries and plums are thought to be all killed, while apples are nearly so in many places. Butter is low—the best bringing only from 15 to 17 cents per pound. Eggs, 9 to 10 cents per dozen; potatoes 25 cents per bushel. Potato bugs numerous. M. L. D.

DALLAS Co., Ala., May 24.

THE prospects hereabouts are good, so far for field crops and also for fruit. I have been picking strawberries since March and am doing so still with plenty of young fruit and plants in full bloom. JAMES MULLEN.

CAMBRIDGE, Mass., May 30th, 1878.

WARMER and drier. Rain wanted badly. Now, vegetation, beyond grass and a few other herbs, none ahead of this time last year. W. F.

IS ANYTHING TO BE LEARNT FROM EXPERIMENTS WITH CHEMICAL FERTILIZERS THE FIRST SEASON?

CAN the farmer ascertain from the results of the first season's experiments, carefully conducted, whether for a given crop his land needs phosphoric acid, potash, nitrogen or any two or all as special fertilizers?

Professor CALDWELL says in the Tribune that the comparative worthlessness of the results of a single year's experiments is very plainly indicated, in most instances, when these experiments come to be repeated. This may be true, but the able article to which we are alluding does not help us to think so. Referring to a large number of experiments in progress for three years on the farm at Cornell University with commercial fertilizers, Professor CALDWELL says:

"If we had stopped with the first year we might have published a number of very interesting and apparently useful results; but when a second year's results came in, it was evident that we could not give both series to the world unless we should put them in the puzzle column for young folks. Now, after a third year, we begin to see some signs of agreement on certain points, but even yet nothing is safely established, and we must keep on experimenting. No chemist, working in his laboratory with the most approved processes of analyses, processes that are in many cases known to give accurate results, ever feels entire confidence in a determination of phosphoric acid in a fertilizer till he has repeated the determination and gets concordant results; how much less confidence should a farmer have in the results of a single year's trial of a superphosphate on wheat, when his experiment is liable to be affected by so many adverse or favorable influences which are entirely independent of the action of the manure; there are disturbing influences in his case a hundred times greater than in that of the analytical process in the laboratory."

What parallelism is there between determining phosphoric acid in a fertilizer in the laboratory and ascertaining the effect of superphosphate on wheat or any other crop in the field? Suppose we select a field the soil of which is as nearly uniform as may be and lay it off in small plots of equal areas for corn. Upon the first, second and third of these, we sow a quantity respectively of potash, nitrogen and phosphoric acid. Upon a fourth potash and nitrogen; upon a fifth, potash and phosphoric acid; upon a sixth, phosphoric acid and nitrogen; upon a seventh all combined, leaving one plot to be planted without manure.

Why cannot we obtain from this experiment valuable results? Why is not the plot which yields the best crop *proof* that the manurial ingredient or ingredients were those the soil most stands in need of? Professor CALDWELL says:

"Every farmer knows that favorable or unfavorable features in the weather, alone, even during a small part of the growing season, may make or unmake a crop; therefore, we do not know but that what appears to have been a failure of a manure may not have been due to bad weather, or that a remarkably good crop may not have been simply the result very largely of a very favorable season and a fair soil."

This is plain enough. But does not the weather affect these plots the same? If the weather were favorable and the natural soil exhausted, the differences would be more apparent than if unfavorable. If unfavorable, either because of wet or drought, would not even then the differences in the appearance of the plants of the different plots be a positive guide as to which plot furnished the food needed by the plants which the other plots did not?

We do not wish to invite any discussion at all with Professor CALDWELL. He has examined the subject studiously—we superficially at most. But there are hundreds of farmers experimenting with manure this season in the hopes of obtaining practical results at its close, and we hope that their hopes are not for the most part visionary, as Professor CALDWELL's statements would indicate.

BOTANICAL STUDIES—MR. MEEHAN'S EXCELLENT WORK.

BOTANY is now taught in many of our schools—in nearly all of our colleges. With many the study ends with their school days, and a bare remembrance of calyx, corolla, stamens and pistils is the most that remains through after-life. A real love of the study is rarely acquired in this way. In fact the constrained study of text-books is rather calculated to dry up the natural impulses than to warm them into the vehement thought and action that inspire all who derive much of either pleasure or benefit from original investigations. The field and woods; the streamlet and meadow should be the class-room of the young botanist. There the captivating parts of the study reveal themselves; the elementary principles are fixed without a conscious effort of the mind and the student naturally takes to books in order to gain as complete a knowledge as may be of what already some information has been acquired. If we wanted a child to grow up indifferent to play we think it might be effected by providing him with text-books on plays which should define in the usual explicit terms their technicalities, philosophy and methods. By the time all this had been committed to memory probably the child would have concluded that he preferred to amuse himself in ways less stupid and complicated. A child who listens to instrumental music well executed, if he has "an ear for music," may be inspired to efforts which shall enable him to produce such music for himself; while if without such inspiration he were obliged to study and to practice the dull rudiments of music for hours each day, he would become sickened of the weary practice. Thus it may be shown that, in all studies and pursuits, the interest should first be awakened. The study should be presented so as to induce voluntary research, which, being voluntary, is not distastefully laborious.

From our own observations we are impressed that a fondness for botanical studies is generally awakened by a person's being accidentally thrown among flowers. He admires them. The possession of a little plot of ground or a sunny window induces him to procure his first plants or to sow his first seeds. At once difficulties arise and inquiries begin. He learns the names of his plants and how to cultivate them. From a knowledge of one or two varieties of a species he is the more interested in other varieties of the same species. Difficulties and inquiries multiply. The interest thus awakened extends to all species and genera until a book on botany becomes indispensable. Then botany is appreciated because it gives the information one zealously seeks. We understand the importance of a study of the structure of plants—we understand the importance of a systematic arrangement, and of names so determined that plants may be designated by the same name as well in one country as another. As one progresses in botany he finds himself again attracted to the wild flowers of the fields and woods. Not, perhaps, that he values less the flowers that have been changed by cultivation—but he values the others more. He is delighted with the botanical learning which enables him to determine the name and entire history of a plant taken from the woods which he had never before seen, and he is as much pleased with a herbarium or with accurate drawings or paintings of plants as is any other specialist with specimens or designs illustrative of his specialty.

These thoughts were called forth by the first two numbers of a work by Mr. THOMAS MEEHAN entitled "The Native Flowers and Ferns of the United States," that more than any other similar work that we have ever seen, is calculated to subserve the object-teaching whereof we have been speaking. It will appear in series, each series complete in itself, and to consist of twenty-four parts. Each part will consist of four colored plates and sixteen pages of text. The size is large octavo, and the work will be sold by subscription only, and delivered to subscribers by agents, one part to be issued every two weeks, and to cost fifty cents! From Mess. L. PRANG & Co., of Boston, Mass., we have received parts first and second, the colored plates (chromo-lithographs) of which are worthy of all praise for their beauty and accuracy, and are really worth, it seems to us, so considerable a part of the subscription price, that an immense circulation alone can insure the publishers against loss. The plates of Part 1 are, first: Tradescantia Virginica; second, Geum triflorum; third, Gilsemium sempervirens, and, fourth, Polypodium incanum. Those of Part 2, are, first: Viola cucullata; second, Anemone nemorosa; third, Aquilegia chrysantha, and, fourth, Pachysandra procumbens. The work appeals "not to one class only, such as botanists, or gardeners, or those who take an interest simply in the poetry and beauty of the floral world, but to all combined." As regards the quality of the reading matter, the name of THOMAS MEEHAN, so well known as the editor of the Gardener's Monthly, and as that of an honest, earnest worker in the fields of botany and practical horticulture, is a sufficient guarantee.

NOTES.

Why Is It?—The value of labor-saving machinery and appliances depends very much upon how they are used and taken care of. Few things are more discouraging—more exasperating to the farmer than to see, day after day, that the members of his household or his hired hands are indifferent as to whether his new and improved implements are so handled that they may pay for themselves or whether they are broken to pieces in a season. More than once we have been prevented from buying such articles which were really needed, because we knew that through ill-usuage they would soon be knocked to pieces and thrown aside. It has often occurred to us that hired men do not measurably consider how much more valuable they might make themselves to their employers if they would act upon the principle that "what is worth buying is worth taking care of" and that "a stitch in time saves nine." It is to be presumed that self-interest would incite laborers to promote their employers' interest in every way, at least when it could be done without unusual work or sacrifice. But we have known workingmen, exemplary in almost everything else, to treat their tools and implements as if it were a part of their duties to render them useless in the smallest possible period. Why is this?

Binding Paint Brushes.—Those who do their own painting will find it economical to take good care of paint-brushes. If buying a good article ever has advantages over buying a cheap one, it is certainly the case respecting paint-brushes. Before use, they should be carefully bound at least one-half the length of the bristles. How best to effect this may not be known to all of our readers. We suggest the following: Wrap one thickness of muslin around the bristles, allowing a margin of six inches of muslin. Then bind a cord evenly and tightly about the brush as low as is desired, and tie in a hard knot. Then fold the muslin back towards the handle where it may be fastened by tacking around the original binding. This will retain the cord.

BREVITIES.

MR. CHARLES DOWNING, the venerable and respected pomologist, is in bad health.

ONE of the unkindest things the microphone does is to magnify a maiden's sigh so that it roars like the cataract of Niagara.

WE would thank our subscribers very cordially if they would have money orders made out to the RURAL Publishing Company instead of to individuals.

DR. HOSKINS, on another page, in the use of hellebore thinks it necessary to apply it to the under part of the leaf for killing currant worms. This greatly simplifies its use and, for aught we see, answers the purpose as well.

MANY of our contemporaries appropriate articles from the Domestic Economy department of the RURAL without any credit—as if there were no obligation to credit them. The truth is, they are just as original, and are written with just as much care as the articles of any other department.

THE Toronto Globe says that "the man who will pass by a potato-beetle at this time of the year without crushing it, is a public enemy." We should like to have the editor here on the Rural Farm and in haste to get to his office in New York. We are afraid he too would prove a public enemy.

HERR R. SCHATZMANN recommends the application of a decoction of ground pepper to cheeses as a sure protection against the attacks of their accustomed depredators. A couple of washings with such a preparation will free a cheese from any number of mites. So says the London Farmer.

A NEIGHBOR farmer, now sixty years old, tells us that if corn is planted three feet apart each way, he prefers to plant two and three kernels rather than three and four. If he could be assured every kernel would grow, he would prefer one to three. If the corn is planted three and a half feet apart each way, then he would prefer to plant three kernels. It is a mystery to him that any experienced farmer would manure in the hill.

THE Germantown Telegraph says: "The RURAL NEW YORKER is trying its hand at a curculio remedy. Somebody tells it that he has tried it and finds it answers first-rate. It is simply to scatter on the ground, under the trees, while the fruit is forming, salt or wood ashes. This is as easy as falling off of a log." That's a mistake—we never dreamed of it. Our comment upon the article evidently referred to, was that the salt and wood ashes might benefit the trees.

THE Prairie Farmer thinks it necessary to crush the shells of peanuts before planting them. We once tried the experiment of planting the seeds alone and the fruit (nuts) entire. The former, for the most part, rotted in the ground. This may have been exceptional. We do not know with what propriety it calls the elongated ovaries or styles "stolons." They are not stolons, if that is meant, any more than the petiole of a leaf is a stolon. Peanuts will thrive upon a harder, more clayey soil than is generally supposed in the north. The power of the pointed style to force itself into the earth is very remarkable.

THE municipal authorities of certain European towns pay children for collecting "May bugs" upon their first appearance. In a few hours the children of Mannheim collected and sold at a fixed rate over 3,000 litres (2,113 American pints.) Suppose our town authorities were to pay for the potatoe beetle upon its first appearance in spring—say ten cents per quart or a remunerative price, whatever that might be found to be. Might not this prove an effectual method of exterminating the pest? Surely every farmer would be willing to pay an extra tax in support of any exterminatory measure that would do away with Paris-green.

Mr. GLADSTONE of England, speaking of war, says:—I am very sorry to say that one of the calamities and misfortunes of war is that it is highly profitable to certain classes. I am a landlord. I am not a great landlord, but my interest in land is great relatively to my interest in other things, and I have not a doubt that to me as a landlord war would in the first instance be beneficial. War would at once add largely to the price of corn, because freights would rise greatly, and every shilling added to the freights of foreign corn would be equivalent to a shilling added to the price of British corn. The farmers have had very much to contend against of late years, and I wish them every possible advantage that the order of Providence and of nature, and invention and skill, industry and perseverance can give them: but I cannot wish that my own rents may be secured or their profits increased by burdens laid upon the nation."

"RURAL" WEATHER STATUS AND PREDICTION.—The highest pressure is now upon a small grove of Pines, on the top of Pike's Peak. The leaves and younger branches are much depressed thereby. It extends eastward for a distance, and then ascends too high for any practical observations. The low pressure is universal and steady, concentrating for the most part in cities, in consequence of which there is a general tendency to go up.

The probabilities are for the next week, that there will be some wind, some rain, and partially or wholly clear or cloudy weather. Storm centers, of more or less magnitude, may form during the week, and occasion the usual results of such meteorological phenomena.

Literary Miscellany.

THE DROVE.

Suggested by Eneking's Picture.

EARL MARBLE.

THE drove of cattle slowly wends
Its way the country road along,
Beneath a sky that o'er them bends,
Inspiring monodies of song,
In keeping with the sober guise
That nature in her woody deeps
Wears, losing all her gaudy dyes
As with the equinox she weeps.

What deep contentment in the group
That in the waters stand hoof-deep,
Unmindful of the lash or whoop!
What joy in this young creature's leap!
And yonder one, with head erect,
And ears set forward, fain would know
What from this stir she may expect;
And on, with sturdy move and slow,

Come others, while against the sky
A horseman rides in silhouette,
Whose fazy motions seem to vie
With cattle's moods, that naught may fret.
The footman, too, with measured stride
The mastiff, with himself content,
And with his charge quite satisfied—
All with the scene are merged and blent.

And so life opens to our view
A sylvan scene, not once, but oft,
Where everything a blending hue
Assumes beneath an air so soft
And bland that thoughts of strife and toil
And strong effects that passion gives,
And fierce theatrical turmoil,
Are lost in life that dreams, not lives.

For is the life that dreams less true
Than that which lives its lurid truths?
Are autumn's skies of ghostly hue
Less true than those of May's and youth's?
The strong effects of youthful days
Have not their lessons truly taught
If age loves not to rest its gaze
On scenes with peace and quiet fraught.

Transcript.

CORA.

CHAPTER XXI.

On the Sands.

CORA'S shrill cry of terror, ringing as it did through the railway station, struck upon her husband's ear and heart with a sudden and sharp pang. He had trusted her, notwithstanding the grave causes she had given him for doubt, and his trust had been betrayed—basely betrayed. Could it be really Cora whom he found alone, flying from Paris in the company of Lord Almane—renouncing her good name, her claim to the respect of her equals and inferiors, committing a grave and dreadful sin for the love which she ought to have striven to put away from her at whatever struggle, whatever cost?

It was solely by chance that he found himself at the station; he was traveling in the express from Boulogne back to Paris, having telegraphed to Cora, and the up train like the down, stopping at Amiens, had allowed him a few moments to obtain some refreshment, and—intercept the fugitives.

It was a terrible blow to him, the conviction thus forced upon him of his wife's unworthiness, and he staggered under the stroke like a drunken man; and the thought that death itself were preferable to such misery, beat itself into his brain.

Lord Almane stood still, and made no movement towards Sir Alan, neither did he bend over Cora, but his face was almost as lividly pale as Sir Alan's own, and his lips were compressed and firm.

Both stood thus motionless for a few seconds; Cora lying prostrate at their feet. Then some of the ladies who had alighted from the train, came rushing up with *flacons*, eau-de-Cologne, vinaigrettes, and offers of assistance, which roused Sir Alan from his momentary stupor.

Stooping over Cora, he lifted her in his arms as easily as if she had been a child; said a few cold words to the Viscount, who answered them with a slight bow, and strode away, with his wife's pale, beautiful face lying upon his breast.

"Take me to the nearest hotel or *auberge*," he said, quietly, to a porter, and the man led him out of the station into the road, and pointed him to a small white house by the roadside.

"Monsieur will have to hurry," he said. "He has about a quarter of an hour before the train starts. But a quarter of an hour."

Alan strode into the little inn, and demanded a bedroom; then he followed the hostess upstairs, still carrying his motionless burden, and when they reached the room, he laid his wife down upon the bed, standing for a moment looking down at her lovely face. It looked almost like the face of a dead person in its terrible pallor, and Sir Alan saw the alteration a few days had made. Her hat had fallen off, the masses of beautiful hair had become unloosened, and strayed over the pillow: and her little hands lay helplessly at her side. With an uncontrollable impulse, he bent over her, and touched the sweet, cold mouth with his bearded lips, in one sudden, passionate kiss; then he turned away, and, giving some rapid directions to the hostess, left the inn, and made his way back to the station, just in time to re-enter the train.

He saw that Lord Almane was already seated, and as he himself entered the adjoining compartment, he stooped mechanically, and picked up something white which lay upon the carpet at his feet, then he threw himself down in a seat heedless—perhaps unconscious—that he was alone, as the train started again, and sped away—away from Amiens—away from Cora—away from his erring, but still dearly-loved wife.

When the first bitterness was over, he began to consider what his movements would be on arriving at Boulogne. He remembered that when there during the day, he had met an old college friend on the quay, to whom he must apply at once on arrival to entreat him to stand his friend in the duel, which he had resolved should take place with Lord Almane. He knew Gilbert Arley sufficiently well to rely upon his friendship in the matter, and if Lord Almane had no friend or acquaintance in Boulogne from whom he could ask a similar favor, doubtless Arley could find him a second.

No doubt, also, that in the early dawn, along the coast, they could find a spot sufficiently retired for their purpose, and when it was over if unhurt, he would return at once to Amiens and arrange a private but complete separation from Cora. He would not see her after it; but if it were possible he would prevent any further possibility of ruin to her. But if he fell, what of her?—what of their child? Would she marry Lord Almane? and would Harold learn to think of him as his father—this man who had injured him so cruelly? No, no—a thousand times no; he should have no power over his son, even if Cora became his wife; and taking out his pocket-book, he wrote a few hasty lines, appointing his mother guardian absolutely to Harold.

"Cora will respect my wishes so far," he said to himself, with a faint, sad smile. "So far; and she may not care for him when I am gone."

The train stopped at Boulogne, and Sir Alan alighted, meeting Lord Almane face to face as he did so.

"I have a friend staying here," said the Viscount, haughtily. "It is late, or rather early, but not too late or too early to receive visitors! I will go to the "Hotel des Bains" and request Sir Harry Bartlet to meet your second here, Sir Alan. It will be more prudent than going to a hotel."

Sir Alan bowed slightly, and then both men drove off—the one to the "Hotel des Bains," the other to the "Hotel Royal," where Captain Arley was staying. Gilbert Arley's astonishment was profound when he saw his visitor. He was not yet undressed, having but just returned from a dinner-party, and, on hearing Sir Alan's mission, threw on an overcoat, and drove back with him.

"By the way, old fellow," he said, as they quitted the hotel, "who is your adversary? Almane! By Mars and Bellona!" and he showed some concern, "he is a formidable one. First-rate shot. Must you fight? Cannot it be arranged?"

"There is no alternative," answered Sir Alan, quietly. "It must be done, and, if possible, get it over at once. In case of my death, take this note to my mother. I cannot find words to thank you, Arley."

"I am glad of it," he answered, trying to smile. "But, Vincent, it is hardly fair of you to risk your life so foolishly."

"You would not speak thus if you knew all," said Sir Alan. "Here we are, Arley. "That is Lord Almane, and I suppose the other man is Sir Harry Bartlet."

Captain Arley and Sir Harry exchanged bows, and moving away together, paced up and down slowly before the station, while Sir Alan leaned moodily over the bridge and thought of Cora, and Lord Almane smoked two or three cigarettes, lighting them with impatient hand, half smoking, and then throwing them away, as if they were distasteful to him.

In about a quarter of an hour, Gilbert Arley returned to Sir Alan, and passing his arm through his, led him away towards the hotel.

"Come and take a couple of hours rest," he said. "We are to meet at Andresselles at dawn, so you will have time. It will do you good, old fellow. You have travelled all day and all night, remember."

More in order to please his friend, than for any rest, Sir Alan threw himself on a couch and tried to catch a little sleep. But he was far too excited and miserable to succeed in getting any repose, and it was a relief when Gilbert Arley came to tell him that the carriage was waiting, and it was time to start.

Very still and silent were the streets as they drove on, the cliffs rose in their quiet, grand solemnity beside them on the one hand; on the other stretched the sea, calm and still, dotted here and there by a passing sail. They drove past Andresselles, then leaving the carriage, and bidding the man wait, they strolled on to the sands, and found a sheltered hollow, admirably suited for their purpose.

A very few minutes elapsed before Lord Almane and Sir Harry arrived, and while the seconds were finishing the last preliminaries the Viscount approached his opponent.

"Sir Allan," he said, gravely, "it may seem absurd that I should try to justify Lady Vincent to you; but I assure you, on my honor as a gentleman, that it was almost entirely by chance that we were fellow-travelers last night."

"It is rather too late for any explanation," said the baronet, haughtily, raising his stately head and looking Lord Almane full in the face with his sad, proud gray eyes. "The score I wish to settle now is not merely an account of last night's business. No," he went on, raising his hand to enforce silence; "your lordship need not trouble yourself any further."

Lord Almane bit his lip as he turned away, and went forward to place himself where Sir Harry desired. In another minute all was ready, and these two men stood facing each other, under the cool, gray morning skies—deadly enemies, foes to the death.

Both were very pale, but while Sir Alan's face was sternly and proudly set, the Viscount's handsome features wore an expression of irresolution and hesitation which rather surprised Sir Harry Bartlet. Gilbert Arley's face was the saddest of the four; he had seen Cora Vincent several times, and in the happy time which followed her marriage; and remembering the deep love she had evinced for her husband, he thought of her grief, if anything turned out badly for Sir Alan.

Strangely enough, he did not connect her with the duel, for the Vincents' conjugal felicity was well known, and more than one gay young bachelor had envied Sir Alan his fair wife, while many a Benedict had wished for the perfect understanding which existed between him and Cora.

There was a momentary pause before the signal was given, and then, simultaneously breaking on the stillness around, rose two sharp reports, which disturbed the sea-gulls, who were lazily moving their wings over the surface of the water.

Both seconds ran forward, but neither Lord Almane nor Sir Alan staggered or seemed hurt. The latter had missed his aim, the former had fired into the air. Deeply as he hated his adversary, he felt that he had injured him enough; and though Sir Alan's eyes flashed at the thought of such a conclusion to the meeting, he was obliged to accept his friend's decision, and acknowledge himself satisfied.

While Captain Arley was assisting Sir Harry Bartlet to put the pistols into their case and exchanging a few congratulatory remarks as to the result of the hasty duel, Lord Almane approached his adversary.

"What I have told you is the truth, Sir Alan," his lordship said, quietly, but earnestly. "Our meeting last night—Lady Cora's and mine—was a chance; she will doubtless explain all to you. It would be useless to deny that I love her. I loved her before you met her, and my affection was returned; but—no, hear me out—I was deceived as to her feelings towards you, and I give you my word of honor that I will never willingly see her again."

He raised his hat with courtly and ceremonious politeness, and rejoined his friend, leaving Sir Alan with a dark frown upon his brow, and an angry sneer upon his lip, looking away over the water with fierce pain, and unsubdued sorrow in his gray eyes.

The drive back to the "Hotel Royal" was accomplished in almost unbroken silence. Avoid them as he would, Lord Almane's words rang in his ears. "A chance meeting!" Over and over again he repeated them to himself, trying to realise whether they could be true or not. He had telegraphed to his wife; but doubtless the telegram had reached the hotel after she had left it. No; it was impossible; she had intended to fly with the Viscount, otherwise why, when they met at Amiens, had she uttered that terrible heart-stricken cry and fallen at his feet as one dead? Was not the fear she showed a proof that she was guilty? If she were innocent, why was she terrified? "A chance meeting!"

It was impossible. Lord Almane fancied he could betray and befool him yet more. How he hated the man! How he writhed at the idea that he had refused to fire at him! If he had aimed at him, and shot him, it would have been the greatest kindness he could have done him.

Captain Arley did not disturb his reverie. Glancing now and then at the gloomy, mournful face beside him, he wondered; but said nothing until Sir Alan turned to him with a smile, so sad and mournful that the young officer felt a choking sensation at his throat.

"Are you wondering at all this?" said Sir Alan. "It is an old debt, Arley. Would that he had let me pay it. How can I thank you for your generous assistance and friendship?"

"No thanks are needed," was the answer. "I am heartily glad it is satisfactorily over. Think of Lady Cora's grief," he went on, "if anything had happened to you, Vincent."

A shudder passed through the stalwart frame of Alan; but he made no reply, and they again relapsed into silence.

After breakfast, having ascertained the hours of departure of Paris trains, and finding there was one in the afternoon which would take Sir Alan to Amiens about dusk, Captain Arley persuaded him to take a few hours' sleep; but any kind of inaction was impossible to Sir Alan, and he paced restlessly up and down the room until he was utterly weary.

Gilbert went with him to the station, and saw him off, watching the pale, stern face as the train started, with intense pity; and when Sir Alan could no longer see the bright, frank face of the young man who had stood his friend, he threw himself back in the carriage. He was not alone this time; two or three French ladies were in the compartment, and they glanced curiously at the handsome, mournful-looking Englishman, who had not a thought or a glance to give their pretty, perfectly-dressed selves.

After awhile, Sir Alan took out his pocket-book, in order to destroy the letter he had written to his mother. As he did so, a white paper fluttered out with it, and the baronet stooped carelessly to pick it up. One glance at it, however, changed his indifference into eager attention as he recognised the handwriting. It was a note to Lord Almane, and ran thus:

"I am tired of my misery and degradation. The love and shelter you offer I will accept. I will meet you to-night at the station, and we can leave Paris together."

A few lines truly; but how much they contained!

Sir Alan sat gazing on them thunderstruck. His last faint hope raised by Lord Almane's earnest and apparently truthful words was destroyed.

It was not a chance meeting. The Viscount was false to the core, and it was this man, deceitful, base, treacherous, whom Cora loved.

CHAPTER XXII.

A One-Sided Explanation.

When Cora's senses returned, the dawn was breaking in the eastern sky and a glimmer of sunlight was stealing into the room where she lay. Her eyes wandered over the apartment without seeing in it one familiar object. It was a bedroom hung with gaily-flowered chintz, and scrupulously clean; there were colored pictures on the walls, and from the window she could see the green foliage of lofty trees.

For a few moments she lay trying to recall where she was, and when recollection returned, a faint cry broke from her which brought to the bedside a woman who had been sitting at the window, busily knitting. She was a cleanly, middle-aged woman, with pleasant, homely features and quick, dark eyes, wearing a print dress, a white apron and a snowy cap.

"Madame feels herself better," she cried pleasantly, in French.

"Yes, yes, I am better. Who brought me here?" And Cora tried to sit up, but fell back on the pillows, giddy and exhausted,

"Madame fainted at the *gare*," said the woman, gently; "and monsieur, the tall gentleman, her husband, carried her here. But madame must not stir until the doctor comes, or she may make herself seriously ill."

Cora turned from her, and hid her face on her pillows to conceal the the tears which flowed unrestrainedly.

After a few minutes the woman approached her again.

"Would madame allow me to assist her to undress?" she said, in her gentle tones. "She will be more comfortable if she goes to bed."

Cora was too weak for any resistance. She let herself be undressed and put to bed, feeling like a weary child, and quite heedless of her surroundings.

"Will you ask my husband to come to me?" she said, at length, feebly.

"But monsieur is gone, madame," was the reply. "Both the gentlemen are gone. Their business was too important to delay, they said; so they brought madame here, and desired me to look after her, and continued their journey."

Cora had listened to her with dilated eyes, with a cold chill striking on her heart.

"Together?" she repeated—"are you sure they are gone together?"

"Oh! yes, madame. They went on in the mail train to Boulogne."

"Did they leave no message for me?" said Cora faintly.

"Monsieur said that madame would know the motive for their haste, and that she was to remain here until he returned."

The motive for their haste! Too well and too truly did Cora know it, and the knowledge brought her terrible pain. What had she done? Oh! heaven, what had she done? They had gone to fight—gone, perhaps, to meet death—one or both!

Oh! Heaven, save him," moaned Cora, as she turned from the light, and hid her face in hopeless despair—"save him from all harm, and let me only suffer, for the sin is mine!"

As she lay there she had leisure to think of it all; to picture the meeting, Alan's terrible anger and pain, and the hatred which must animate both men.

"And I am so powerless!" she sobbed, as she tossed about among the pillows, and tried to cool her burning brow. "Oh! Alan—oh! my husband."

In the morning the doctor came, a little surprised to find a patient so evidently of high position at a small *auberge* like the "Maison Blanche," as the little roadside inn was called. He gave her some soothing potion, forbade any excitement, and went away, promising to call again the following day. But the potion had no effect in calming Cora's excited nerves.

Hour after hour she lay there, sleepless and miserable. She could hear, as they passed, the shrill whistle and rumbling of the trains, and the gay chatter of the servants and customers of the "Maison Blanche" as they talked under her windows.

Now and again the kindly hostess came to her, to see if she could do anything for her; but Lady Vincent shook her head in silent misery, and Madame Dumoulin went away, feeling sorry for the poor young wife, who she began to suspect, was deserted by the big Englishman, who had called himself her husband.

Evening came, and Cora could bear her misery no longer. During those twelve short hours she had suffered a life-time of anguish, and the inaction was unbearable. She rose, and with slow, feeble movements, managed partially to dress herself, and then put on the dressing-gown which Spills had put in her traveling-bag, and whose dark shade of crimson made her pallor still more ghastly. Having proceeded so far, she was forced to sit down and rest, before continuing the process of hair-dressing, and she sank upon one of the old-fashioned chintz-covered arm-chairs by the window, with her hair falling around her, and shading the beautiful, mournful face.

As she sat there, a familiar step, sounding on the pavement without, attracted her attention, and the blood mounted in her cheek as she recognized her husband's voice. It was he!—surely it was he! and she rose, and leant out of the window. Yes, she was not mistaken; the tall form standing by Madame Dumoulin was the form of her husband. He had returned, and unhurt.

"Thank Heaven, thank Heaven!"

Throwing her hair back from her face, she tried to reach the door of her room, but her strength failed her, and she was obliged to support herself by the back of a chair. She heard steps on the stairs, coming along the landing, and pausing at her door. Then it was opened slowly, and Sir Alan Vincent appeared on the threshold. He came in quietly, closing and locking the door behind him.

A slight expression of surprise crossed his pale, haggard face when he perceived his wife; for Madame Dumoulin had led him to imagine that she was too ill to rise, and her appearance seemed to say that the landlady was right. He noticed the extreme pallor and exhaustion of every feature—the perfect helplessness and powerlessness of her attitude as she drooped over the high-backed chair, without which she could not have stood at all, and a sentiment of pity for her mingled

with the anger and wounded love which held dominion in his heart.

"I think you had better sit down," he said; "I have much to say to you."

His tone was very hard and cold. There was no relenting in his stern face as Cora raised her despairing eyes to his. She sank into a chair, leaning her hands upon its arm, and bowing her head upon them in an attitude of hopeless despair.

"I have much to say to you," he resumed, keeping his eyes from glancing at the bowed form of the woman he loved so passionately still, "and the interview can hardly be a pleasant one. Are you well enough to listen to me? You have been ill; perhaps a longer repose is necessary for you?"

"I am well," she said. "It is only the suspense which hurts me."

"You are sure?" he said, doubtfully. "You know my dislike to scenes. I would rather wait than risk one."

The cold, cutting tone stung her. She lifted her head with a momentary flash of pride.

"You need not fear," she answered.

"That is well."

There was a silence. Sir Alan seemed to have some difficulty in expressing what he was going say, for he hesitated.

Cora stole a long glance at him; she saw that looked worn, and ill, and aged, as if some eat trouble had passed over him; and all her art went out to him with a cry of love which ost rose to her lips.—To be continued.

WIDOW SAXE'S TRIP TO THE CENTENNIAL.

L. A. BROCKSBANK.

SHE was determined to go—cost what it might. Several of her neighbors had been *talking* of going, all summer, but it was likely to end in talk, as it was then the middle of September, and not one had gone except Doctor COBURG, and he, being a widower, had to go alone, poor man! So of course, the little village of Saxville would be none the wiser for what he might see at the Exposition.

"The fact is," she said, "a man may see wonders, but it takes a woman's tongue to describe them."

So widow SAXE, after due reflection, packed her large traveling trunk, reserving for a moderate-sized valise such articles as might be required for more immediate use, and filling a small lunch-basket with plump New England "doughnuts" and rich yellow cheese, she shook out her brown linen duster, placed beside it her ample umbrella, parasol, fan, gold-bowed spectacles, and bottle of smelling-salts, and lastly her *opera glasses*. She was going for sight-seeing, to be sure.

Here permit us to remark that the widow SAXE was considered rich in that modest little community, being the widow of the lamented Doctor JOHN SAXE, who had made pills and plasters, killed or cured in that same town for a quarter of a century, and, having been wise enough to abstain from his own medicine, had lived to a good old age, leaving behind him, at last, a buxom widow (some years younger than himself), a gentle young daughter and a moderate fortune.

Within two years after his death, three young doctors and one old one had settled in the village, to supply his place. Of course there was rivalry. With the young people the young doctors were the most popular. Among the older and wiser heads (Mrs. SAXE included) the more experienced Doctor COBURG was the favorite physician. Human nature is the same in town or village, and widow SAXE, with the rest of them, was more human than angelic. At least, her daughter's husband had more than once been tempted to —think so.

On this particular morning, as soon as the early breakfast was over, Mrs. SAXE informed ROBIN, her son-in-law, that she should take the train for Philadelphia (due in forty-five minutes), and *he* was to be her escort for the trip. The baggage was in readiness; he had only to send it on, and she would walk with him the short distance to the depot.

"What in thun—! Why, mother, it is quite impossible! Who is to attend to my business? —and such short notice too!"

"And mother,—that large trunk! Why, how long do you mean to stay? I thought you told Doctor COBURG that 'a *sensible* person would be apt to stay away from that heathenish Exhibition,'" chimed in the voice of little Mrs. ROBIN.

"Come, come! There is no time to discuss the matter. ROBIN, go attend to the luggage, and send JACK to me."

ROBIN looked at his wife, who stood staring into vacancy, gave one glance at his shirt-front, and darted from the room, pulling his mustache with one hand while the other was firmly clenched.

It is needless to say, perhaps, that when the "7:15 train" came puffing up to the depot, the Widow SAXE, ROBIN, bag and baggage, were on time, and among the first to step off the platform; while it was just possible that poor little Mrs. ROBIN was bathing her pretty eyes in cool water to remove the trace of unbidden tears.

Pleasanter expressions of countenance—however,—might have been seen on that same car, than ROBIN'S, as his august mother-in-law, waved him into the first vacant seat. Consigning to his care valise umbrella, parasol, and shawl-strap, retaining for herself the lunch-basket, while she secured a more desirable seat by the window.

Having settled herself comfortably, withdrawn the right hand glove, and removed her veil, she gave one calm, deliberate look at her fellow-passengers—strangers, all;—then settled back in her seat and drew one long, deep breath of mingled relief, and satisfaction.

She was on her way to the Centennial! and not a soul in Saxville had enjoyed the pleasure of making the matter a theme for gossip.

It is worthy of remark, that ROBIN'S visage cleared up, as the train swept on, which was quite natural under the circumstances. If the widow had seen little of the world, ROBIN had seen less, having never before passed the limits of his native State. His business might suffer, it was true, with no one but his younger brother, "JACK" to attend to it, during his absence, but after all, he was "in for a good time," while the entire expense, as well as responsibility would be sustained by his able, and strong-minded relative. The only regret, after all, was, that his wife was not by his side;—poor girl!—But there was no help for it.

In the meantime Madam SAXE was becoming awake to the facts of the case, cost and consequences. Looking more anxious and unsettled just in proportion as ROBIN'S uneasiness subsided. Glancing furtively back at him, she suddenly bethought herself of danger to her luggage, and as suddenly she sprang up, rescued it.—valise, umbrella shawl-strap &c.,—and returning to her seat, she carefully bestowed it in the vacant corner, which no one had yet presumed to claim.

As the hours elapsed, she became quite weary of gazing upon the flying landscape, picturesque, or otherwise, and for a change betook herself to her well supplied lunch-basket.

Here, ROBIN would have willingly joined her but the invitation was not forthcoming, so he kept his place, and fasted.

As the train aproached the great busy city of New York, Madam SAXE began to regret that she had not had the power to summon a more experienced, and reliable escort.—(such as Doctor COBURG might be,—for instance.) Possibly she might meet him at the Exposition, and how comfortable it would be for them all to return in company.

These pleasant fancies occupied her mind till they were whirled into the Central Depot, at New York. Here it became evident that a change was to be made,—but what she did not know. It had been her impression that she would be taken directly to Philadelphia,—a slight mistake—that was all. Indeed she had scarcely given the matter a thought, still less had she sought information. She expected to go, as others did, of course.

She had been looking for ROBIN, till half the people were off the car, and been unconsciously borne on by the living current, till she found herself near the platform, with the crowd pressing in the rear, and outstretched hands in front, eager to help her, with the rest, off the car.

Such commotion! Such a jam! What could she do? and where were her possessions? and where was ROBIN?

"Kerriage, Mem? kerriage, kerriage? Have a kerriage, Mem?"

"Good gracious!" she thought; "what will become of me, and what *has* become of ROBIN? I wish I had staid at home."

And there she stood, alone, a stranger in a strange place. What to do, or which way to turn she knew not. Hundreds of people were flying hither and thither, all alike unmindful of her. Among them all no ROBIN with tall beaver and "cut-away" coat. And her trunk, what would become of that?

"Mrs. SAXE! are you waiting for a friend. Can I assist you?"

What voice! It was not ROBIN'S; but it was recognized at once, and never did her own name (which she had always been proud of, because it reminded her of Prince ALBERT) sound so sweetly before, even from the lips of Dr. COBURG.

On his return from the Centennial, surely heaven had sent him to her relief. And without a moment's hesitation she decided to return home with him, leaving the grand Exposition to others, and even ROBIN to his fate. Minus everything but sane mind and sound limbs, she soon found herself homeward bound, on the wings of steam, a gladder and a wiser woman.

In the meantime where was ROBIN?

On finding himself in the crowd, separated from his companions, he was at a loss what to do. A restaurant, close at hand, suggested one way out of immediate difficulty, and he stepped in and ordered oysters and coffee for two; trusting to luck, and a usually good appetite, to lead her, as they had him, to this same place.

In this he was disappointed; forgetting, perhaps, the "lunch basket"—which had been *her* traveling companion.

So he managed to dispose of the second cup of coffee just in time to catch the *last* car of the homeward bound train—on a forward car of which, his worthy mother-in-law was seated by the side of old Doctor COBURG.

It may be as well to remark that he, not being the "purse-bearer" of the expedition was, of necessity, obliged to return; only too thankful for the means to do so.

A few hours later, on that same eventful day, ROBIN being more fleet of foot than the venerable old couple of the forward car, had arrived home first, and had had just time to send the color from the cheek of his astonished wife by informing her that he had "had the misfortune to lose his mother-in-law," when the door-bell announced another arrival.

ROBIN met the radiant pair on the threshold only to send the color from older faces, for all the way from the depot had Madam SAXE been trying to frame some sensible excuse for having lost her daughter's husband, and for finding old Doctor COBURG; and in the dim light of that waning day, ROBIN did, in fact, look like a ghost. Imagination can picture the rest.

If the widow SAXE could not—with the "million"—talk of what she had "seen at the Centennial," she soon furnished a different theme for gossip to the lively little village—her husband's namesake, by changing her own name from Saxe to Coburg—by doing which she claimed that she lost nothing, as this would still serve as a reminder of Prince ALBERT; in fact, the union of the two names, Saxe-Coburg was certainly something quite remarkable and high-sounding.

Even before the close of the great Exposition, which after all she did not go to see, the wide-awake and energetic widow had been persuaded (by those lips so incapable of telling what the eyes might have seen there,) to leave the "unreliable" ROBIN and his wife to their own guidance for the future, and to go and make old Doctor COBURG'S home happy.

ROBIN got his moustache pulled by his meek, little wife, on the wedding-day, too, for simply quoting a line of Shakespeare, viz.:

"All 's well, that ends well."

TRANSACTIONS OF THE COBLESTONE FARMERS' CLUB.

A record showing how useful City clubs are in forwarding the interests of agriculture.

REPORTED BY A SILENT MEMBER.

The minutes of the last meeting were counted, while the members tucked their trousers into the tops of their boots, put off their glossy silk hats, and drew forth from under their garments rusty slouch hats which took the formers' places, This gave the meeting an experienced, knowing air.

The walls were adorned with life-like pictures of the fruits of the field, with the names printed in very bold letters,—"This is a Pumpkin," "This is a Beet," etc. Such foresight was not without its value. A member could always know the kind of thing the speaker alluded to by means of these chromos.

The proceedings were opened by reading the journal—The N. Y. Bugle was most commonly selected—after which the president introduced Mr. NEMATUS VENTRICOSUS, an entomologist of distinction, who read a paper on a newly discovered insect. He said.:

"It is unnecessary to explain to you, farmers, that there is a difference between a bug and a beetle. One digests his food, the other swallows it whole. This fact explains why the grasshoppers have such appetites.

"The subject of my paper this evening is an insect which I believe I have had the honor of discovering. It is the Virginia Creeper—an insect capable of doing incalculable harm to our agricultural interests. It feeds on them until they are consumed. I have planted some of these interests in my garden, and shall watch the result carefully. I have no doubt that these interests will be exterminated in a short time, unless Congress grants me an appropriation to suppress the Creeper. HARRIS says, in his Instincts Injurious To Vegetation—"

A member.—"Insects."

Several members.—(Furtively reaching to an inner pocket and glancing hurriedly at a little book filled with names and definitions)—Yes, yes, insects. Things that go on four legs and a wing."

The Speaker—(with dignity).—"You are mistaken, gentlemen. I don't mean what you mean. This is HARRIS on Instincts, another HARRIS—friend of mine."

Members.—"Ah! that's another matter."

The President here rapped for order, but a member had sent him out on errand, and the errand had not yet returned.

The Speaker.—"HARRIS says that Columbus found in Virginia an insect somewhat similar to the one I am about to describe, growing in a wild state on the savages, but that they were exterminated by the use of civilization and carbolic acid soap.

"This thing attacks the earth, paralyzing the superphosphate of bone and other manurial ingredients present in the soil, which has a tendency to raise the price of fertilizers, and is subversive of liberty and our institutions. It is especially injurious to pumpkins."

At this the members glanced hurriedly about the walls of the room until they found the thing the speaker alluded to, when the speaker continued.

"I have carefully noted its ravages on this esculent. When the fruit is nearly ripe it stings it; the leaves wilt, and the pumpkin turns from a dull green to a golden yellow. It is then fit only to feed to stock and to be made into pies. The seed is sometimes saved and sold to the seedsmen for watermelon seeds. Hence responsible dealers cause a printed guarantee to be affixed to each packet sent out, to the effect that seeds are not what they seem—sometimes.

"This insect lays its eggs in the spring, but its young are not large enough for market when spring chickens fetch the highest prices."

The speaker was called upon, at this point, to show a specimen of the insect, and after fumbling about his person in a confused manner for a time, asked leave to be excused for a moment, that he might retire to make a more careful search.

It was growing late, so I unobtrusively slipped my trousers out of my boot-tops, hung up my slouch hat and went home.

At the next meeting a foreign gentleman is to read a paper on a new plant recently introduced into Europe. It will be very instructive. I shall be there.

OUR DUMB FRIENDS.

E. F. M.

As we study with greater patience and kindness the lives of the lower animals, we discover much that is beautiful and wonderful in their loves and friendships, not only for us, their masters and owners, who feed and caress them, but for each other. No one doubts the faithfulness, or watchful care of a dog for his master's interests, or his devotion even after a death, for the dog has been so closely associated with human sports and dangers and the household life, that he is better known than most animals, but it has long been the habit of many persons to regard cats, as incapable of strong feeling, and to jest at the many monkey tribes as if they were nothing but caricatures and burlesques.

Yet the following letter which appeared in a recent number of The Spectator, tells the story of a faithful attachment between a cat and a dog, creatures naturally of alien traits and natures. The writer says:

"Colonel C—s' little black-and-tan dog "Flo" died last Monday morning about three o'clock. He had had her many years, and she had long had an internal complaint. She was a dear, little affectionate creature, and had always been treated as kindly as a child. He buried her in his garden, and over her little grave his housekeepers' children shed many tears.

Yesterday I heard from him as follows: Another of my domestic pets was an old black cat, which came to me a kitten years ago, a few weeks before I brought "Flo" from Oxford. They grew up together, and were very fond of each other, eating from the same plate and drinking from the same glass. I have often seen them stand side by side before my fire, and occasionally put their mouths together as though they were absolutely kissing. Well, the poor old cat seemed very miserable all day yesterday (that is, Monday, the day on which "Flo" had died early in the morning), and we could not induce her to eat. She could not be found last night when the house was closed; but as this occasionally happened, not much was thought of it. This morning she was found stiff and cold, stretched out by the side of "Flo's" grave! I could not have believed it, if I had not seen it with my own eyes. Whether it is only a coincidence, I will not pretend to say, but I would rather believe that the poor animal died from grief at the loss of her old friend. But if so, how did she know that "Flo" was dead? Such a fact as this leads to strange thoughts, or what would be called strange by these who can see in these creatures "only a dog," or "only a cat."

Another instance of gratitude and affection shown by a cat to a *human* friend is mentioned in the same article; and not long ago an old lady pointed out to me an old cat—who seemed the favorite *protegee* of the house—as a pet of her grandson, which had evinced the most marked delight and affection at his recovery from a childish illness. On this occasion the cat, then a kitten, had been placed on a corner of the bed near its foot that it might not disturb its little invalid friend, and the cat had ever since chosen this especial place for its morning and evening naps.

As for monkeys, a thousand incidents are told by those who know them of their intelligence. A little chimpanzee in the Zoological Gardens of London once saw his keeper turn a key in a lock. He begged for it, and it was given to him, but his poor, imperfect little hands failed to turn the key. He worked at it hour after hour for one or two days, and at last died of chagrin and nervous excitement of the brain. I can scarcely imagine anything more pathetic than this wistful and absorbed search after knowledge in a little creature so weak and undeveloped.

A higher faculty—love, including self-sacrifice—was displayed in the little monkey, who had conceived a great terror of a large baboon in the same gardens with himself. The little creature chattered and cried with fear when he saw its great, hairy form, and could scarcely be persuaded to look at it. But one day, the monstrous animal sprang in a fit of rage at the friendly keeper, and was tearing his throat when the little monkey saw it, and all his fear vanished by the stronger power of his love; at the peril of immediate death he sprang in turn on his dreaded enemy, and bit and shrieked until help arrived for his friend.

After such an act as this I think we must, like CHARLES KINGSLEY, regard animal natures as capable of heroic deeds—certainly of warm and loving friendships—which may brighten both the higher and lower lives they bind together. If we are truly wise, we will

"Count nothing that we meet with base,
But live and love in every place."

WHAT becomes of all the pins? A sagacious question very often asked and very difficult to answer. Of the millions of pins that escape us in this metropolis alone, how few are ever picked up. Do the fairies take them? A pin, though small, is not a very perishable article, but it has a marvelous aptitude to make away with itself. But even larger pieces of metal in daily use manage to disappear. There must be tens of thousands of horse-shoes dropped in New York in the course of the year, yet how rarely they are seen. This is all the more remarkable, inasmuch as it is considered lucky to pick them up, therefore people are on the lookout for them. There is a great demand for the nails by which they are fastened, in the manufacturing world. The hanging the have got through constant wear makes them of more value than even new nails—for what, does our reader think? To make stubb twist barrels. It seems odd that the same malleability could not be given to the iron in some quicker and more simple manner than the traffic of horses' feet.

A *fete* was given at Wellesley College recently by the students Aid Society and several hundred friends of both sexes, including Gov. Rice and other prominent men from Boston and elsewhere attended. At a meeting in the afternoon the objects of the society were explained and the reception of three contributions of $5000 apiece, for the establishment of scholarships, was announced. The remainder of the day was spent in visiting the grounds and several races between student crews took place on the lake.

Queen Victoria was fifty-nine years old on the 24th ult., and the anniversary was made a holiday in Canada, while flags were displayed on the British Vessels in New York.

BRIC-A-BRAC.

ASHES OF ROSES.

SOFT on the sunset sky
Bright daylight closes.
Leaving, when light doth die,
Pale hues that mingling lie—
Ashes of roses.

When love's warm sun is set,
Love's brightness closes;
Eyes with hot tears are wet,
In hearts there linger yet
Ashes of roses. [*St. Nicholas.*

INSECTS AS TALKERS.

"Two ants," says Buchner, "when they are talking, stand with their heads opposite each other, working their sensitive feelers in the liveliest manner, and tapping each other's heads. Numerous examples prove that they are able in this way to make mutual communications, and even on definite subjects." "I have often," says the English naturalist, Jesse, "placed a small green caterpillar in the neighborhood of an ant's nest. It is immediately siezed by an ant, which calls in the assistance of a friend after ineffectual efforts to drag the caterpillar into the nest. It can be clearly seen that the little creatures hold a conversation by moans of their feelers, and this being ended, they repair together to the caterpillar in order to draw it into the nest by their united strength. Further, I have observed the meeting of ants on their way to and from their nests. They stop, touch each other with their feelers, and appear to hold a conversation, which I have a good reason to suppose refers to the best ground for obtaining food." Hague writes a letter to Darwin "that he one day killed with his finger a number of ants who came every day from a hole in the wall to some plants standing on the chimney-piece. He had tried the effect of brushing them away, but it was of no use, and the consequence of the slaughter was that the ants who were on their way immediately turned back and tried to persuade their companions, who were not yet aware of their danger, to turn back also. A short conversation ensued between the ants, which, however, did not result in an immediate return, for those who had just left the nest convinced themselves of the truth of the report."

TWO AND ONE.

THOU hast two ears, and but one mouth;
Remember it, I pray;
For much there is that thou must hear,
And little say.
Thou has two eyes, and but one mouth;
Ponder the reason well:
Full many things thou art to see,
And few things tell.
Thou hast two hands, and but one mouth;
Nature has rightly done,
For she has given two for work,
For eating, one.
[*From the German of Ruckert.*

POETRY, some practical people think, hath no value. Not so, even in this prosaic age. The price paid by the *Nineteenth Century* to Tennyson recently for his ballad of the Revenge was pretty high, yet it is not the highest paid in our time to a poet. The ballad contains 120 lines, and the author received for it 300 guineas, or $12 50 a line. Mr. Robert Bonner paid Longfellow for the "Hanging of the Crane" $4,000. That poem contains 200 lines, at which rate the poet received $20 a line. For "Tithonus," published in an early number of the *Cornhill Magazine*, Tennyson received 100 guineas, or $7 25 a line, and Tom Moore much exulted in receiving a guinea a line.

AN ABORIGINAL CHANT.

WHAT time the glittering rays of morn
O'er hill and valley steal,
Chief Joseph's squaw, with dog and horn,
Prepares the Indian meal.

And if, with wild, rebellious shout,
The pappoose shall appear,
The chieftain leads the bad child out
Clutched by the Injine ear.

The breakfast o'er, the daughter strolls
Down glen and shady dell;
While gay young braves, from wooded knolls,
"Look out for the Injine belle!"

Each stricken brave she turns and leaves
Her coyness to bewail;
Her dragging blanket stirs the leaves—
The well-known Indian trail.

A Black Hills miner, scalped and dead,
Upon the ground is found,
Grim speaks the chief, "There's been, I'm 'fraid,
An Indian summers round."

What time he rideth forth to shoot,
His favorite horse the dapple is;
And when he wants a little fruit
Goes where the Indianapolis.

When finished are his warlike tasks,
With brazen incongruity,
For overcoats and food he asks,
With charming Indianuity.

At night, before his bed he'll seek,
With countenance forlorn,
He takes his scalping-knife, and eke
He trims the Indian corn. [*Hawkeye.*

IF a cat doth meet a cat upon the garden wall, and if a cat doth greet a cat, O need they both to squall? Every Tommy has his Tabby waiting on the wall, and yet he welcomes her approach with a hideous yawl. And if a kitten wish to court upon a garden wall, why don't he sit and sweetly smile, and not stand up and bawl; lift his precious back up high, and show his teeth and moan, as if 'twere colic more than love that made that fellow groan?

"DE big sunflower may rise above
De modest 'tater vine,
An' brag about its Sunday clothes,
An' put on airs so fine;
But when the winter howls around,
And the snow lies at the doah,
De big sunflower, oh! where am he—
De 'tater hez de floah!"

For Women.

CONDUCTED BY MISS FAITH RIPLEY.

SONG.

I WORE your roses yesterday
About this light robe's folds of white;
Wherein their gathered sweetness lay,
Still clings their perfume of delight.

And all in vain the warm wind sweeps
These airy folds, like vapor fine;
Among them still the odor sleeps,
And haunts me with a dream divine.

So to my heart your memory clings,
So sweet, so rich, so delicate,
Eternal summer-time it brings,
Defying all the storms of fate.

A power to turn the darkness bright,
Till life with added beauty glows,
Each moment touched with tender light,
And every thought of you a rose.
[*Celia Thaxter.*

THE NEW HAMPSHIRE MIRANDA.

CELIA THAXTER is well-known as a poet to the readers of the Atlantic. She is thoroughly a New Englander and revolves around Boston. Her life has been peculiar and romantic. Her father was a local politician at Portsmouth, N. H., and having failed to get an appointment which he had every reason to expect, he became disgusted with mankind in general and politicians in particular, and resolved, like a Yankee Timon, to renounce society. Consequently he bought one of the islands known as the Isles of the Shoals, and retired there with his family, determined never to return to the main-land. He adhered to his resolution; he built a rude dwelling and remained there until death, some 16 or 18 years. On the island (Appledore, formerly called Hog Island) Celia Leighton was born, and there she grew up, never visiting the shore, her father having forbidden her to do so on pain of his eternal displeasure. When about 16, a lovely and natural girl, a lawyer, much older than she, went to Appledore for his health, having heard much of the restorative influence of the open sea air upon the lungs, his own having troubled him greatly. Her father refused to have him under his roof; but finding the lawyer bent on remaining in any event, and that he had erected a cabin of his own, he finally agreed to accept him as a boarder.

The result may be anticipated. The New Hampshire Miranda could not be thrown day after day into the society of the invalid Ferdinand without inspiring and being inspired by the tender passion. She had never seen any man except her father and two brothers, and she would therefore have fallen in love with Thaxter had he been a humpback, his name Spriggins, and his trade undertaking. He would not have been quite human had he been able to pass days and evenings on the rocks girt by the ocean, under the sunshine, starlight, moonbeams, in the delightful companionship of that child of nature. What happened was inevitable. Father Leighton was amazed and enraged when the lover asked his consent, and vowed he should never, never, never have his daughter. Thaxter swore then by Blackstone, Coke and Littleton that he would have Celia without the paternal sanction, and was so sure to keep his oath that the recluse yielded reluctantly. The two were joined in wedlock, and as the lawyer had greatly improved in health, he took his bride to the main land, and they went to Boston on their nuptial tour. Since, she has divided her time between Portsmouth, Boston and the Shoals, spending the warm months on Appledore, where she has a cottage. Her brothers, Cedric and Oscar, have the inn on the island, and have made money by the annual influx of summer visitors. Celia Thaxter is the chief lion or lioness of the place, and entertains many of her admirers and friends. She is enamored of the Shoals, thinking them unsurpassed for pleasantness, picturesqueness and health. They constantly figure in her verse. She has written a little book in prose about them, and she never wearies of chanting their praises. Her husband is not seen very often, his wife appearing to enjoy herself despite his invisibility. She is buxom, of liberal avoirdupois, of excellent health and digestion, talks fluently and eloquently, and if she owns any secret sorrow she does not parade it for the gratification of the curious. She is no longer young in years—she must be 45—but she is as young in feeling as she was in early womanhood. She has a son grown to man's estate.

MRS. WATSON'S BOYS.

MRS. J. E. M'CONAUGLEY.

FOUR great boys in the house and only one little four-year-old girl. It did look at first sight as if it was a rather unequal division of the "help" between father and mother. But that impression came from a want of familiarity with the family habits.

It was EDWARD'S job to get up in the morning and make a fire for mother in the kitchen and dining-room, and he thought it no great hardship either. If EDWARD had been a girl, most likely mother would have built the fire herself. Mother and SILAS usually made their appearance down stairs about the same time, and she never had to say, as I have heard some mothers entreat their daughters: "Now *do* hurry and get that table as quick as you can."

As methodically as an old clock, SILAS wheeled out the table the first thing and laid the cloth and plates, as neatly as if he had been bred a hotel-waiter. Probably he dallied over a paper a few minutes afterwards until the cheery sound "your breakfast is ready SILAS," greeted him from the kitchen. For in the buckwheat season SILAS was the cake baker for all the family, so mother could preside at the table in the usual orderly way. The good mother knew it was not a very heartsome thing for a growing boy to bake cakes for all the family before he had broken his own fast over night. So she always had something hot and nice fixed for him at one end of her big kitchen table where he could eat and chat with mother, at his leisure, while the other boys did up the chores. That was a good stroke of policy with Mrs. WATSON, and SILAS would remember those morning breakfasts lovingly when he was an old man. Then he was fresh and cheery and ready to put on the full buckwheat capacity of the big stove for the benefit of the rest. They all knew how to take a turn in the kitchen and put a room to rights up stairs as orderly as a West Point cadet could fix up his quarters.

They were taught from babyhood the good, soldierly habit of waiting upon themselves, so that it was very easy to add on the lesson of waiting upon others when there was a need for it, and particularly upon their hard-working mother. A great many girls are not half so ready or helpful, the more the pity! The boys could wash and iron some, and make a short-cake and pot of coffee, or cook a steak as well as the best Bridget to be had for money. They were none of them of that class to which Horace Greeley referred, where he said they would "starve to death in the garden of Eden for the want of somebody to pick the fruit." None of Mrs. WATSON'S boys would be reduced to the straits a soldier boy of my acquaintance was, where rations of dry flour were served out to the men.

"How did you cook it?" I asked.

"I mixed it with water, and salt if I had it, and then set it on the coals until it was cooked or burnt, and then ate it."

One thing these handy WATSONS used to do for their mother, which anybody's children could do where a mother does her own housework. They always cleared the table and set away the food in its proper place in the pantry or cellar; thus saving her a great many miles of weary walking in the course of a week.

These boys were not a whit less manly than neighbors' sons who sat toasting their boots around the fire, while mother wearily walked around them, doing all her work and waiting upon them besides.

A family thus trained once lived in a beautiful homestead up the Hudson. A friend was there at a family gathering when the mother's hair was silvered, and "the boys" came home from distant abodes to this happy meeting. One left his editorial chair, one his large wholesale establishment on Broadway, and all came from posts of honor and usefulness. When the feast was over, a son led his mother back to her cozy arm-chair and her guests, while her sons went merrily to work and "cleared away the things and washed up the dishes" as in olden times.

A little housework in their boyhood will not spoil them in the least.

LETTERS FROM A COUNTRY GIRL.—No. 5.

MARGARET B. HARVEY.

IN the neighborhood in which we lived there was a society composed of young people, meeting sometimes at the houses of the various members, sometimes in the lecture-room of the church. I would suggest that the former place be used in the infancy of such an association; the latter when it has grown. Both have their advantages: the first brings members more closely together, the second gives better opportunity for a higher grade of entertainment and culture. Every community which has not such an organization needs one. And to the woman who liked my suggestions, in former letters, and followed them and profited by them, I would say: Go to work to start a society. Begin now, so that by autumn, when its work will be most needed, it will be well under way.

Interest the young people first, by inviting them to spend an evening at your house. If you can privately, beforehand, notify several of your young friends to be prepared to read or sing or play for you. If you can send for a friend at a distance, who has some special talent, all the better. If you can afford to offer a few simple refreshments, do so; if not, never mind, finish the evening by a few old-fashioned romps. Then, when you are sure they have all had a good time, say that you would like to form a society among yourselves, to meet at stated times; object, mutual entertainment and improvement. If they are in favor, capture the brightest, most energetic spirits for your right-hand men and women. If they think it would not work, try again until you *can* get support.

But it will scarcely fail if you feel your way carefully. Encourage your friends to prepare songs or recitations, or to volunteer to read or play, and ask them to bring friends and spread the interest. After a while, when the association has taken form, speak of contributions to a Library Fund. Meanwhile, use for common readings to form the subject of conversation, essays, debates, etc., the best books that you have or can borrow. Many interesting exercises can be invented by yourselves. I shall describe briefly, two, outside of the ordinary range of music and declamation.

One was this. A young gentlemen of our number, who had quite a fund of humor, as well as talent for sketching, would, prior to the time of meeting, draw something on a blackboard—a number of ridiculous faces, a fantastic landscape, a Mark Twain Map. Then he would stand before the association, and in deep, solemn tones, "deliver a lecture" on physiognomy, painting or geography.

Another, less amusing, but perhaps more profitable, was: The president would give out a number of slips of paper, each containing a question in history, philosophy, mythology, science, etc., to be answered the next meeting. These, supplied by members to be answered by other members, would compel a large majority quite often to read and consult authorities.

After the Library comes the Piano Fund. You might give a concert for one or both. The mere fact of the society's having in their possession a library and a piano, would stimulate the community generally to study. Out of the Library Fund a number of standard magazines should be taken, to be accessible to all. If it cannot be arranged to have the Library open at all times, it can be on the afternoon and evening of the regular meeting.

I began by describing a simple, home society, and ended with a large lyceum and its machinery. Well, so ought you; that is, you must aim for your organization's growth in numbers and in power.

After a time it will pay you to combine your resources, so that you can, now and then, have a noted reader or, musician to come and entertain you. This done, occasionally, will give the people a higher standard of culture, and they will learn to appreciate fine literature and music.

Shakespeare and Handel will then become more than mere names. I do not admire "spouters" and "squallers," but I think it just as likely to occur in one place as in another, that the young people will learn to converse intelligently of the early English poets and later novelists, and to sing beautiful selections from classic authors.

Once in a while, also, a scientist—he need not be very eminent, provided he is accurate in his facts—may lecture for you. As a matter of course, this will awaken some latent love of a particular branch of science in some of your youth. All the better if they follow this bent. Then for general information you will have a more or less complete flora and fauna of the district classified, the collection of flowers and insects and birds gradually accumulating in the cabinets which have become the property of the society.

Art can be studied by the members chiefly from books read by sections, and by purchasing photographs, heliotypes and plaster-casts, which latter being educational, will also form appropriate ornamentation for the society's room, or rooms—for by this time, you ought to have some kind of a regular headquarters. Ruskin's Modern Painters is a good work with which to start. Many of the most famous paintings have been copied so as to be within reach of all.

I do not know how much of this can be done in *your* section of the country—but I know that all has been done in several of which I know. But the simplest kind of a reading-circle is better than the utter monotony of too many places. And I believe it possible for every settlement to become the center of an intelligent, cultured community.

A PERFORMANCE was given in aid of the Shakspeare Memorial Theater, Library and Gallery, now approaching completion at Stratford-on-Avon, at the Gaiety Theater in London recently. The performance was arranged by Miss Kate Field, and embraced the following features:—Selections from "Romeo and Juliet," "As You Like it," "Merchant of Venice" and "Henry the Eighth," a short speech by Miss Field on the subject of the memorial, and an exhibition of the telephone harp, etc. Miss Field sang "Angels Ever Bright and Fair," and appeared in her comedietta, "Eyes Right." Shaskpearian airs were played on the telephone harp in Shakspeare's house at Stratford-on-Avon, and distinctly heard by the audience. There was a large attendance at the theater, and the financial success is described as splendid.

ITEMS FOR CORRESPONDENTS.

BY THE EDITOR.

L. M. BROWN.—As you do not wish to purchase any more silk, you had best take for the body of your underskirt some black cambric or any black skirt you may happen to have, and trim the bottom of it with a flounce (as deep as your goods will allow) and a heading of silk. Make a long overskirt of the underskirt, and as it is *full* you will probably have some to spare. This, with the overskirt you have now, will be ample for the underskirt flounce. Your basque ought to be lengthened about three inches. You can add a piece on it and cover the seam by a fold of silk, a band of velvet or a double row of lace. You need have no hesitancy about adopting the cambric underskirt, as the richest silk dresses (new material) are made with cambric or stuff goods underskirts, ornamented with a flounce and puffings or piping of the rich material.

MISS LINGOOD, Columbia Co., N. Y.—I would recommend Littell's Living Age. It will suit your purpose better than any other magazine published in this country.

LOTTIE MASTERS, Thousand Islands.—I do not care to discuss the merits of any political measure through the RURAL. If you want to read the arguments in favor of free trade you can address Putnam & Co. of New York, who have published several pamphlets advocating the advantages of lowering the tariff; but I must ask you to excuse me from expressing my opinion on matters political.

LILY BENTON, Essex Co., N. J.—Use your old black silk as an underskirt, and buy some one of the rich, fancy black grenadines for an overdress. The prices range from $1 up. A very elegant quality is purchasable at $1.50.

Domestic Economy.

CONDUCTED BY EMILY MAPLE

SIFTINGS FROM THE KITCHEN FIRE.

ANNIE L. JACK.

THE fire burns low: chips take the place of hard wood, and the siftings are like the writer's household experiences—light and of little value. It is not how near to, but how far from the fire we can manage to do our needed duties that is now in question; for with the thermometer at 80°, cooking becomes a burden, and desire for carbonaceous food is sure to cease. Then we find fresh fruit a relief from puddings, and the children sup upon rice and milk, with good appetites. We must study more the foods suited for the season and adapt ourselves to it. The oil or blubber so necessary to the Russian or Esquimaux, is out of place in our hot, dry air; so is the pork and other strong foods we use in winter with impunity. The farmer who neglects to supply his family with a variety of the fruits, in their season, is wanting in needful prudence, as by such a precaution many a doctor's bill might be saved, and the general health of the family materially increased.

I said something like this as we came in from the garden yesterday with just time enough to cook our potatoes and asparagus for dinner before that hour arrived, and with keen appetites, good boiled ham, and a dessert of stewed rhubarb and cream with the last of our winter apples, we felt that more elaborate cooking was not needed, in the heat of the day. So we study when the breakfast is preparing to have some dish on hand for the dinner: it may be corn-starch, or tapioca, to be eaten cold for dessert, or perhaps a pie, if fruit is not in season. When that time comes, expect not oh, "Autocrats of the dinner-table," that anything more delicate than strawberries or raspberries or blackberries or rosy and white currants, will be set before you, as a substitute for pie; for with such it is our will that you be served, with a sprinkling of sugar and a richness of cream, the cook books never knew. Are there to be no more siftings? Ah! sign of golden summer days, — *the fire is out.*

CONVENIENCES.

I WISH that every household in this goodly land could have all the modern conveniences that the proverbial "Biddy" so persistently demands in every new place.

Indeed, we can hardly blame Biddy for wanting them as we regretfully look back to the time we reveled in their possession and found them very handy, But aside from sinks and tubs, are there not many conveniences to be had, with little or no expense but that of forethought?

I have seen a neighbor preparing a meal and during the time going back and forth a score of times to a distant closet for pots, pans, spoons, salt, pepper, and everything else that was needed, and all the time complaining of being so tired that she could hardly stand. A small closet near her cook stove, to hold the needed articles with a few dishes to serve up the meals, would have spared her many steps each day. And think of those saved in a week, a month a year! MAY DAY.

DOMESTIC RECIPES.

Raspberry Short-Cake.

Take a coffee-cup of sour cream; a teaspoonful of soda; flour and salt. Sift the flour and add a little salt; then stir the soda into the cream and before it stops foaming turn it into the flour; mix stiff enough to roll out—careful not to get it too stiff—into three or four circles the size of a small pie-tin; butter each and place one on top of the other; bake until well done in a quick oven; pull the layers apart and spread each one plentifully with ripe fruit previously sweetened with pulverized sugar; place layer upon layer and serve at once with sweetened cream.

Old Potatoes.

Peel and boil in salted water and take up as soon as done that they may remain whole; have ready some rolled crackers and a beaten egg; dip the potatoes into the egg and then into the crackers and fry in boiling lard.

MRS. KATE BRADY.

Raspberry Shrub.

Place red raspberries in an earthen dish; cover with good cider vinegar—not too strong and let stand twelve hours; strain and to each pint of juice add one pound of sugar; boil ten minutes and bottle hot.

Raspberry Vinegar.

The following makes a delicious summer drink by stirring two or three tablespoonfuls of it into a tumbler of iced water. Fill a stone jar with ripe berries and cover with pure, strong cider vinegar; let stand five days and then strain through a sieve, pressing out all the juice. Allow one and a-half pounds of white sugar to each pint of this juice and boil until the sugar is dissolved, removing any scum which may arise. Take from the fire, bottle and seal.

Iced Tea.

Let me give our way of preparing this cooling drink for lunch or tea on hot summer days. The tea should be made in the morning and of half green and half black; make stronger and sweeter than usual; pour into a jug and place in the ice-house or chest. Serve in goblets with small pieces of broken ice.

Lemon Tea.

Add a few slices of lemon and a little of the juice to tea made as above.

Livingston Co., N. Y. GRACE BENINGTON.

Black Currant Jelly.

To every five quarts of currants allow one and a half teacupful of water, and to every pint of juice, when strained, one pound of sugar.

Remove the currants from the stalks, and put into an earthen dish, with the proportion of water given; cover the dish over tightly, and place in the oven for one hour and a half; then squeeze out the juice through a coarse, cloth bag, and to every pint of juice add one pound of sugar. Boil from one-half to three-quarters of an hour—skimming well; pour into jelly-glasses and tie down.

Black Currant Jam.

Gather the currants when thoroughly ripe, and pick from the stalks; bruise slightly, and to each pound of fruit allow three-quarters of a pound of sugar; put sugar and fruit into a porcelain kettle, and boil nearly one hour over a slow fire, stirring constantly. COUNTRY GIRL.

Onion Toast.

Boil some small onions, changing the water twice, and salting it the last time. When done, take the onions up with a skimmer. Thicken the water, which should be boiled away to about a pint, with a very little corn-starch; add butter, pepper and salt to taste. Have toasted some thin slices of bread, lay them in a dish, put the onions on the slices, and pour the gravy over.

Dropped Eggs.

Have a saucepan of boiling water, and drop fresh eggs carefully into the water; let them stand where they will be hot, but not boil until the whites set. Toast some thin slices of bread nicely, lay them in a dish, and pour over a gill of rich, hot cream salted to taste; take up the eggs with a skimmer, and put an egg on each slice of toast; sprinkle a little salt and pepper over, and garnish with parsley if you please. E. M.

QUERIES ANSWERED.

WILL you define the terms *Souffles, Vol-au-vent* and *Baba?* I have seen those terms in cookery but did not know their meaning. C. O.

ANS.—(1) *Souffle* means something puffed up, and is generally applied to a light kind of a pudding made with any kind of farinaceous substance. (2) *Vol-au-vent* is a figurative expression applied to puff-paste of the lightest kind. (3) *Baba* is a kind of light plum cake.

WANTED.—A cement for sealing corks in bottles? E. L. L.

ANS.—Melt together one-fourth pound each of sealing wax and resin with two ounces of beeswax. When it froths, stir with a tallow candle.

How can oil marks, caused by people resting their heads against my parlor walls, be taken out? JANE B.

ANS.—Try pipe-clay mixed with water to the consistency of cream, laying it on the spot and letting it remain over night. Next day remove with a penknife.

News of the Week.

MONDAY, June 3d, 1878.

AT HOME the Potter committee of investigation into alleged republican electoral frauds in Florida and Louisiana is still the chief topic of interest, and will probably so continue for some weeks at least. Most of the recognized leaders of the democratic party seem not to have been consulted about the move, and some of them, such as Pendleton, and Alexander H. Stephens, are strongly opposed to it. In making it, many say Mr. Potter was merely Mr. Tilden's mouthpiece, or phonograph, repeating the lesson learnt at Gramercy Park. The Boards of Trade of several of the large commercial centers have protested against any action looking to the removal of Hayes from the Presidency as ruinous to business, and the same sentiment seems to be widespread through pretty nearly all classes in the country. Mr. Potter has written a long letter belittling but not denying the possibility of such a movement. In it he is discontented with the action of the Electoral Commission, saying, pretty truthfully, that the democrats held the winning cards but that the republicans bluffed them, and he maintains that the chief object of the present inquiry is to ascertain facts, so that if frauds be established, a repetition of such frauds may be prevented, and if not, to clear up the belief throughout the country that there were such frauds. To him Mr. Stephens has replied in a forcible letter protesting against the determination to make the inquiry one-sided and against the opposition to Mr. Hale's amendment making it to cover all electoral frauds, and finally denouncing the whole movement as likely to disturb the peace, quiet, and harmony of the country, and to end either in a contemptible farce or a horrible tragedy. Postmaster-General Key, the democratic representative of the South in the Cabinet, has also taken to letter-writing. He assumes it as proved that if the democrats have a majority in both Houses of the next Congress, they intend to oust Mr. Hayes and inaugurate Mr. Tilden; that they rely on the "solid South" to do this; that such action would be unwarrantable as the question was irrevocably settled by the last Congress; that any attempt of the kind would be certain to lead to another deplorable civil war, not between North and South, but between neighbor and neighbor throughout the land. He urges that as the Senate must certainly be democratic, it is essential for the purpose of preventing such a calamity that the people should vote in the fall elections for no man who does not distinctly pledge himself to oppose any such movement. Newspapers, here and there throughout the country, are ringing the same tocsin of alarm and prophesying terrible things; but it is very unlikely that the generation that has suffered the disasters, deaths and despair of the last internecine war, will ever tolerate any scheme at all likely to lead to a repetition of so bitter an experience.

Meanwhile, on Saturday June 1st, the committee began proceedings by the examination of James E. Anderson, supervisor of registration in the parish of East Feliciana, La., during the last Presidential election. This is the scamp whom Gen. Sheridan declared he wouldn't believe under oath, whose proferred testimony neither party would accept in the investigation held shortly after the election, and who ever since has been trying to blackmail the Administration or to make lucrative terms with any party willing to pay him his price for his evidence. He asserts that some time after the votes of the parish were handed in at New Orleans, he committed perjury by swearing that a fair election there had been rendered impossible by democratic bulldozing, and that he was impelled to this crime by the promptings and promises of Secretary Sherman and other "visiting statesmen," and he produced a number of copies of alleged letters to confirm the truth of his present statement. His evidence has produced some effect certainly, but there are always two sides to a question and only a self-confessed perjurer has hitherto been heard. At present the "visiting statesmen" are the objective point of attack, and Secretary Sherman just now seems slightly wounded. It is just possible that both Hayes and Tilden may both be smirched during the inquiry, and while there are not a few republicans, like Conkling and Blaine, who would bear with fortitude the sight of the former bespattered, there are thousands of good democrats, even outside of Tammany Hall, who would shed no tears at the spectacle presented by the latter bedaubed with Florida or Louisiana mud.

By a vote of forty-one to eighteen the Senate has passed the House bill, prohibiting the further withdrawal of greenbacks and directing their reissue by the Treasury. This is a compromise between the advocates of contraction and inflation, and will doubtless receive the President's sanction. It has the advantage of affording a larger volume of currency for transacting the enormous business of the country, and therefore tends towards making times a trifle easier; and the disadvantage of establishing a precedent for Congress to constantly meddle with the amount of the currency and therefore with its value, and consequently with the value of all existing contracts. Already it is found so difficult to put into circulation the $3,000,000 of silver coined every month in accordance with recent legislation, that by the 1st of May $17,000,000 of it had accumulated in the Treasury vaults—another proof, added to hundreds here and elsewhere, that in financial matters, legislative measures from which high hopes are entertained, are very likely to be attended with disappointment. The Syndicate has taken the $50,000,000 of 4½ per cent. bonds, for which it had agreed to pay in gold, and the Secretary of the Treasury says he will be ready to resume specie payments by next January, should Congress, meanwhile, refrain from repealing the law to that effect. The House has cut down the army from 25,000 to 20,000 men, but the measure may yet be defeated in the Senate. The present force has to defend 12,207 miles of frontier; to guard against 270,000 occasionally hostile Indians; to prevent Mexican depredations; to protect $204,601,681 worth of government property, without including the public buildings in Washington, besides aiding the revenue officials to break up illicit distilleries, and serving as a safeguard against riot and destruction, in case of such disorders as paralyzed traffic last summer. The Indian Bureau has been transferred from the Interior to the War Department by the same bill that has cut down the forces at the disposal of the latter. This is a sad blow to the swindling contractors and agents who have grown rich by speculations and cheating, and have been the principal source of our troubles with the aborigines.

It has lately been widely published that, during the war, Gen. Grant's march towards Richmond by way of the Wilderness instead of by the James River peninsula, was due to President Lincoln, who insisted that the army should be kept between Washington and the Confederates, although Grant was said to have stated that this line of advance would cost 100,000 men more than that adopted formerly by McClellan, and which he wished to follow. In a recent interview with a newspaper correspondent, Grant emphatically contradicts this statement, and says no such advice was ever given by Lincoln, and if any blunders were made in that campaign, the responsibility rests solely and absolutely upon himself. By the way, the General is looming up as a candidate for the next presidental election; and there is little doubt but that, in their present straits, he is head and shoulders or rather from the knees up, a bigger favorite with the republican party than any other man—but then such men have bitter enemies, and 'tisn't the strongest man that always secures the nomination. John Scott Harrison, son of President Harrison, ex-member of Congress from Ohio and father of Gen. Harrison, last Republican candidate for Governor of Indiana, died suddenly on May 25; and was buried on the 29th, at North Bend, Indiana. As there had been several cases of body-snatching lately, special precautions were taken against ghouls; but it was found on the 30th that the corpse was taken for the purpose of dissection to the Ohio Medical College at Cincinnati. There it was discovered by one of his sons; the janitor of the college has been arrested and intense excitement aroused. Science can surely find enough subjects in hospitals and elsewhere, without having recourse to such infamous outrages to secure material for the scalpel. The aged poet and journalist, William Cullen Bryant, had a severe fall in this city on the 29th ult. and is still suffering from concussion of the brain. There are, however, good hopes of his recovery, but at 82 it does not take much to snap the thin thread of life.

The Iowa Democratic State Convention met at Cedar Rapids on the 29th ult., and nominated a State ticket, headed by T. O. Walker for Secretary of State, there being no election for governor this year. Their platform advocates the customary doctrines, and says, apropos of the present Congressional inquiry, that a thorough investigation into election frauds should be made; frauds should be exposed, truth vindicated, and criminals punished in accordance with the law, when found. The Russians have bought another fast steamer in Philadelphia, and despite the pacific news from Europe, the Muscovite seamen in our waters and on shore are still briskly on the move, while all their doings are closely watched and reported by British spies. For the past week a *cause celebre* has been on trial across the Hudson in New Jersey. The Rev. Mr. Vosburgh has been accused by his brother-in-law of an attempt to poison the latter's sister—the pastor's wife. The trial has caused intense excitement; the clergyman, being supported by his congregation, and declared innocent by his supposed victim who is now in good health. Last Saturday evening the jury brought in a verdict of "not guilty." On Sunday morning, a second-rate paper of this city, contained five long columns on the Tilton-Beecher scandal. In it a Mr. Mix, a newspaper reporter who says he was a confidant of Tilton and Moulton, bitterly charges both these worthies with a a foul conspiracy to destroy the great Plymouth preacher. The effusion bristles with vituperation, innuendo, bald statements and personal animosity, but is a trifle weak in the matter of proofs. 'Tis doubtful if public interest can again be aroused in this nauseous scandal, even by an action for libel against Mix, or the paper that admits his diatribe. Great trouble is expected in Montreal on the 12th of July next. A number of Irish societies have been invited from the United States to a pic-nic there on the 11th. The great Orangemen's procession is to take place on the following day, and crowds of Orangemen are expected from all parts of Ontario. The Government has been requested to take precautions to preserve the peace, and all visitors will be rigorously searched for arms. Sitting Bull is once more reported to be getting ready to go on the war path in the United States as soon as the grass is thick; the troops along the frontier are prepared to give him a warm reception. Escobedo has succeeded in invading Mexico on behalf of Lerdo. He is said to have captured a few petty towns, levied some contributions, of course, and won some minor triumphs. The whole country from the Mississippi East, has been visited during the week by severe wind and rain storms, here and there assuming the form of destructive hurricanes or tornadoes; many lives have been lost, much property destroyed by land and water, and another unusual feature added to this year's weather record.

It was only on the 11th of last month that the fanatic socialist, Hoedel, attempted to assassinate the Emperor of Germany while driving along the Avenue, Unter den Linden, in Berlin, and at two o'clock yesterday afternoon a similar attempt was made in the same place by another of the same stripe, named Nobeling. As the imperial carriage was passing No. 18, two shots were fired from an upper window. Thirty shot and slugs have been extracted from the Emperor's body, mainly from the face, chest and arms, and further mischief might have been done, had not a chasseur, after the first shot, thrown himself over the Emperor in the carriage. The wounded man is doing pretty well, though one shot in the wrist is considered dangerous at his great age. The would-be assassin barricaded himself in the room, resisted capture and finally tried to kill himself. It was with great difficulty that the quickly-assembled mob were prevented, in their fierce indignation, from tearing the wretch to pieces. Nobeling is a doctor of philology, a native of Dresden, and for years a resident in Berlin where he has edited a socialistic paper. He has long contemplated the crime, and it is supposed others are also implicated. The Crown Prince and his wife — Queen Victoria's eldest daughter—who were in London, have hastened home. Despite the one thousand million dollars Germany wrung from France half a dozen years ago, distress among the lower orders is to-day much greater in Germany than in France. Success begot extravagance and speculation wilder than here at the close of our war; then came collapse, pinching and inconvenience for a few of the aristocracy of birth or commerce and grinding poverty and starvation for thousands of the laboring classes. Militarism grew more exacting, and accumulated hardships have driven the lower orders in crowds across the Atlantic, while those who remained behind, in their misery, have lent a

ready ear to the plausible sophistries of the Commune. So many are the socialists in Berlin that since the crime of Hoedel, three weeks ago, 20,000 of them publicly followed to the grave the corpse of Drentel, one of their leaders. Some days since the Government introduced a bill into the Reichstag enforcing severe measures against them, but the first clause was so badly defeated by a union of the Radicals, Liberals and Ultramontanes, that the Government withdrew the whole of it. If reintroduced after this second outrage, it will stand a better chance of passing.

"It is the unexpected that happens" is one of those French paradoxes that turn out true far more frequently than one expects, and this is very likely to be the case with regard to the peaceful issue of the European complications. Invitations to the long-deferred and often-despaired-of Congress have been issued by Bismarck and accepted by all the Powers interested, and the meeting will take place at Berlin on or about the 15th inst. Count Schouvaloff, the Russian ambassador to England, who will represent Russia, started yesterday for St. Petersburgh to receive final instructions. Lords Beaconsfield, Salisbury and Odo Russel will represent England, which may well be proud of the results of her energy and determined diplomacy. Nearly all the conditions to be affirmed at the Congress are already agreed upon, and it is expected to hold only a few sessions. Peace across the Atlantic will be rather a bad thing for many of our farmers, who have planted wheat extensively in the expectation of European warfare affording them a profitable market; but for the sake of Christianity and humanity all should rejoice at the prospect that Europe will escape the horrors of so bloody a war as that which has been threatening it, would certainly prove.

On Saturday forenoon three German iron-clad war-vessels, the Konig Wilhelm, the Prussen and the Grosser Kurfurst were steaming off Folkestone in the English Channel, when the last, changing her course to avoid a passing bark, was run into by the first and sank in a few minutes—cause of accident, the steering gear out of order. Of her crew about 300 were lost and 210 saved. The Konig Wilhelm put into Dover with her prow smashed in, and the forward bulkheads full of water. HERMAN.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, June 1, 1878.

BEANS AND PEAS.—Recent free receipts of beans have not included a fair proportion of mediums, and that grade is firm with moderate sales. Marrows still lack steady Cuban business and our quotations are very full. Fine pea beans could be more largely used, but they are noticeably as scant as they have been for several seasons. White kidneys sympathise with the lull in marrows and prices are extreme. Red kidneys have run down to a few small lots in two or three hands, and prices are firm at the advance. Black beans quiet. Green peas steady for good quality at $1 05@1 10. Canadian field peas, in bulk and bond, easier; 79½@80c. Southern H. E. peas nominal at $3@3 25 ₱ two-bush. bag. We quote medium beans, prime, $1.65; fair to good, $1.40@1.50; marrows, prime, free on board ship, $1.75; fair to good, $1.50@1.70; Peas, $1 40@1 65; white kidney, $1.50@1.65; red do., $2.50@2.90; black, $2 35@2 40.

Receipts of beans past week, 5,796 bush. Exports of beans, 840 bbls.

BUTTER.—Regardless of the low prices given in our last another decline is to be noted. By Tuesday last dealers in State found they could not cope with sellers of Western, and at the close of a week which has had the drawback of a holiday and several rainy days, they seem to have resigned the contest. At least, we hear none of them advocating further free receipts of State after attempting to mark down rates to match figures for Western. The main cause of lower prices arises from the very liberal receipts of Western, and as the useful average quality of it diminishes the late precedence held by State in that respect. It is likely that Western will keep this load until hot weather again advances the merit of State. No line of dealers, however, can feel much encouragement in the style of trade now current. Notwithstanding the low rates of Western a good many of the off grades, such as common factory and milled stock, have to go into store. A surplus of this kind always gives wholesale or export buyers more or less independence.

State creamery, choice, 19@20c.; other, 16@18c.; half tubs and pails, choice, 17c.; other, 13@16c.; Welsh tubs, best, 16@17c.; other, 13@15c.; poor State, 10@12c.; Western creamery, choice, 19@20c.; other, 16@18c.; Western dairy, best, 13c.; other, 9@12c.; factory (ladle packed), 10@11c.; other, 9@10c.; milled Western, 5@9c.; old and grease, 3½@5c.

Receipts for the week, 34,508 pkgs.; exports past week, 2,250 do.

BEESWAX.—A small business is being done with shippers. Sales at 26½@27½c. for Western and Southern.

Exports since Jan. 1st.. 85,300 lbs.

BROOM CORN.—A late revision of prices names the following rates:—Brush and hurl, 5,@7e.; medium green, 5@5c.; red or poor straight, 4@4½c.; crooked, 2½@3½c. The demand is hardly wholesale in its volume, as the supply of brooms is large enough to prevent rapid manufacture. A late feature in the trade is a move to establish a uniform rate for crooked by quoting half-price, with hurl for a standard.

COTTON.—The export and spinning demands have been liberal, and the market closed strong. Latest prices are for June, 11,53@11.54c.; July, 11.59c.; August, 11,53@11,54c.; September, 11.33@11.34c.; October, 11.06@11.07c.; November, 10 91@10.93c.; December, 10,93@10.95c.; January, 11@11.01c.; February, 11.07@11.09c.; March, 11,16@11,17c; April, 11.20@11.27c.

Quotations are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted:

	Uplands.	*Ala.*	*Orleans.*	*Texas.*
Ordinary	9	9	9⅛	9⅛
Strict ordinary	9⅜	9⅜	9⅜	9⅜
Good ordinary	10	10	10⅜	10⅜
Strict good do	10⅜	10⅜	10⅝	10⅝
Low middling	10¾	10¾	11	11
Strict low middling	11 1-16	11 1-16	11 3-16	11 3-16
Middling	11⅛	11⅛	11⅛	11⅛
Good middling	11⅜	11⅜	11⅜	11⅜
Strict good middling	11 15-16	11 15-16	12 1-16	12 1-16
Middling fair	12 7-16	12 7-16	12 9-16	12 9-16
Fair	12 15-16	12 15-16	13 1-16	13 1-16

Stained.

Good ordinary	9c.	Strict good ordinary	10c.
Low middling	9e.	Middling	10⅜e.

CHEESE.—With the receipts of the country advices early in the week, the market here was completely upset. Shippers were very indifferent, and the supplies were piling in beyond all precedent, for this season of the year. Prices looked sharply at one time; fancy factories were obtained as low as 7½c., and the other grades relatively lower and difficult to sell. Towards the close trade became better in the fancy lots, and 8 generally made, and for exceptional lots 8¼c. The shipments for the week are 51,466 boxes. Quotations are, for fancy, 8c.; 7@7½c. for good and prime; 6@6½c. for fair; 4@5½c. for half skimmed, and 2@3c. for skimmed. State, farm dairy at 6¾@7½c. for good to choice, 5½@6½c. for fair to good and 2@3c. for poor skimmed. Western factory fine, flat at 6½@7e.; do. good to prime, 5½@6½e.; do. fair, 4½@5½c.; do. half skimmed, 4@5c. do. skimmed, 2@3e. Wisconsin factory, fancy, 8e. do. good and prime, 7@7½e.; do fair, 5½@6c.

A severe hindrance to sales occurs through the weak quality of stock. A large proportion of the arrivals are of only fifteen days' curing, and sellers are forced to hasten sales—a fact which always gives independence to buyers.

Receipts for the week, 90,336 boxes.
Exports, past week 86,406 boxes.
Gold closes at 101.
Liverpool quotation, new 50s.

DRIED FRUITS.—Apples are offered easy in price and are dull. Peaches are neglected. Small fruits generally firm.

Peaches—Fancy North Carolina 12@13c.; Choice Georgia, 10@11c.; good to prime Georgia; 8@10c.; unpeeled halves, 4½c.; quarters, 4c. Pitted cherries, choice new, 21@22c.; Raspberries. 25@27c. New York State plums, 12½@13; Southern plums, 11@12c. Blackberries, 10@10½c. Apples—State quarters, 4¾@5½c.; do sliced, prime, 6@6½c.; good, 5c.; Western quarters, 4@4¾c.; Southern at 6@7c. for prime sliced, 5@5½e. for fair to good; Southern quarters, 4¼@4½e.; Tennessee quarters, in bags, at 2½@4½c.; prime and fancy North Carolina sliced at 8@;2c.

Exports for the week, 450 bbls. dried apples.

EGGS.—Receipts for the week, 10,175 bbls.; do last week, 10,700 do. There is a good, steady demand that has supported prices for the past week. Buyers, however, insist on choice quality when the extremes are paid for Western and Canadian stock is turning out unely; 13c. is a frequent quotation. Sales of all stock now quoted loss off.

Few near points arrive, a local demand begins to hold them back. New Jersey and L. I., 15c.; State and Penn., 13@13½c.; Choice Western and Canadian, 13c.; good, 12½e.; off quality, 11½@12c.

FRESH FRUITS.—Apples nominally quoted, $1@7 bbl., few here or to come. Strawberries have been scarce for a day or two owing to the rain, and prices are exceptionally high. Md. and Del. sold at 7@12c.; New Jersey, crates, 10@11c. To-day the range is 11@18c. for the scant supply of good. No more due from Norfolk. Southern cherries, prime, 13@15c. lb.; small to fair, 4@11c. Gooseberries, ₱ bushel 2s to quality. Georgia peaches more in poor order; there have been sales at $3 crate. Hot-house peaches, doz. $2@3; do. Black Hamburg Grapes, $1@1.25. Peanuts dull, it looks as if rates would have to decline. Hand-picked, Va., $1.35@1.40; fancy, $1 25@1.30; fair, $1.15@1.25; common, 5@9c.

FLOUR.—Prices have been steadily declining on large supplies, and the lower range for Wheat. Latest prices are $3.30@4.15 for very inferior to fancy superfine State; $4.25@4.50 for poor to good extra do. odd lots and lines; $4.50@4.15 for good to fancy do.; $3.25@4.15 for very poor to fancy superfine, Indiana, Iowa, Michigan, Ohio, &c., $4.25@4.30 for very inferior to good shipping extra do., and $4 50@5.65 for good to fancy extra do. common to about choice white wheat extras, $4.50@5.65; choice to very fancy do. at $5.65@6.75; red and amber winter wheat, inferior to very choice trade and family at $4.50@5.85; round hoop Ohio at $4.25@4.60, and trade and family brands of do. at $4.70@5.75, the latter rate for choice, (fancy lots quoted higher); St. Louis, $4.40@5.25 for very poor to good extra, and $5.25@6.50 for good to very choice, with a few brands of fancy quality quoted up to $7.00 Minnesota clear, very inferior to very fancy choice at $4.35@5.37; Minnesota "straight," inferior to very fancy, at $5.35@6.50, and patent poor to fancy choice at $5.40@8.25; unsound stock at from $2.00@5.00; city mill extra at $5.40@5.65 for fair to very choice for West Indies; do. for England at $4.25@4.40; do. trade and family extras, $6.00@7.25; do. for South America, $5.75@6.50 for fair to very choice; No. 2 at $2.15@3.20 for very inferior to strictly very choice.

FEED.—Is at a decided decline, 40 and 60 lbs. at $13@14, and 100 lbs. at $16@17.50.

GRAIN.—There has been a severe decline in all articles, through the large receipts and reports of liberal shipments forward from cable points.

Latest sales of No. 2. Northwest spring at $1.07@1.08; do., first 10 days in June at $1.08; do. June option, at $1 07¾@1 08; New York No. 2 spring, spot at $1 06@1 07; do. June option at $1 06@1 07; do., July option, at $1 05@1 06, closing at $1 05 old; No. 2 Milwaukee spring spot, at $1 18@1 19; No. 2 Chicago spring at $1 06½; No. 1 Milwaukee and Minnesota spring, part to arrive shortly, at $1.10@1 12; ungraded red Western at $1.12@1.16; No. 2 Toledo red, spot, at $1.07½@1 10; extra white at $1.22@123½; No. 1 white at $1.21@1 25; ungraded white Western at $1.23; amber Michigan at $1 17½; No. 1 red at $1.15@1 16; New York No. 2 red at $1 13@1 15, closing at $1.13@1 13½; and do June option, at $1.12. Rye at 65@68c. for State and 63@66c. for Western. Corn at for No. 2 July option, at 45¾@46¾c.; No. 2 June option at 44¾c.; do. at 45c.; steamer mixed, June option, at 43¾c.; do. July option, at 43¾c. Of the spot lots New York No. 2 at 44½@45¾c.; New York No. 3 at 42½@44c.; New York steamer mixed at 43½@44c.; Kansas mixed at 45@46c.; mainly at 45@45½c.; steamer yellow at 48@50c.; ungraded mixed at 42@46c.; and western yellow at 4.c. Oats at for No. 2 Milwaukee, 30½c.; No. 2 Chicago at 30½@30½c.; New York No. 1 white at 36¼c.; New York No. 1 at 29½@30½c.; do. July delivery, at 30¾c.; New York No. 2 white at 30@30c.; New York No. 2 at 27½@29c.; New York No. 3 white at 28c.; mixed western at 27¼@30c.; white western at 29@30c.

HIGHWINES are held at $1 08, and bids lower.

HAY AND STRAW.—Supplies are large, the reports from the river sections that the crop is much better advanced than usual at this period, cause free sellers at easy prices.

Hale hay, 50@55c. for shipping, and 65@75c. for retail qualities; clover, at 50@60c. for prime. Straw quoted at 40@50c. for long rye; 35@40e. for short rye, and 40c. for oat.

Exports, past week, 630 bales; Since Jan. 1st 27,909 do.; same time last year, 25,650 do.

HOPS.—The shipments are sufficient to draw upon the accumulations, exceeding the receipts, and for all desirable grades there is a steady temper to the market.

New Yorks, good to prime, 7@10c; do., low and fair, 5@7c.; Eastern, new, 5@8c.; Wisconsin, do. 5@8c.; Yearlings, 2@3c.; Olds, all growths, 1@2c.

MISCELLANEOUS.—American essential oils: Peppermint, in tin, $1 70@2; in glass, $2. Wintergreen, $1 90@2; Sassafras, 39@40c. currency; Seneca root, 53@55c. Ginseng, $1 10@1 20. Feathers, choice geese, 45c.; mixed, 40@42c.; scalded, 35c; duck, 20c.

OIL-CAKE—Western quoted at $30@30,50

PROVISIONS—Hog products have tended a little stronger, with a fair trade.

Mess pork quoted $9@9,25 for spot lots; $9 30 for June and July; $9 35 for August, and $9 40 for September, Bacon at 4¾c for long clear and 5c for short clear. Lard at 6.75 for spot, 6.72½ for June and 6.75 for July. Tallow at 7c. for prime. Stearine at 7¾c. for prime. Beef hams at $19.50@20. Beef—For extra mess, $11 75@12; plain mess, $10@11.50; packet, $13.00@13.50 for bbls.; extra India mess, $20@22 for city brands; do. Philadelphia, $19@20.

POULTRY AND GAME.—The market has been overstocked with live from day to day, and prices have ruled decidedly weak. Spring chickens have also declined. Turkeys are completely neglected; from this out it will be more profitable to rear instead of shipping.

Fowls.—Near points; 9@10c.; Southern and Western, 8@9c.; Spring Chickens, N. J., 20@22c.; Western, 18@19c.; Turkeys, 8@10c.; Choice, Ducks, pair, 75@87e.; Southern and Western, 50@62c.; N. J. Geese, $1.25@1.50; other, 87c.@$1.25.

Dressed poultry continues nominal. City-dressed can undersell country. Very little good country-dressed, however, now arrives.

Turkeys, 8@11c.; Phila. fowls, 12@13c.; N. J. 10@12c.; State and Western, 8@10c.; Spring chickens, Phila., 23@25. Southern and Western, 20@22c.

There is only a fair demand for game, and moderate receipts supply it. Doubtful snipe, $2@2.25 doz.; Sand, 50c. Stall-fed wild pigeons, $1@$1.12; flight do. 75@85c; Squab, 65@75c.

VEGETABLES.—Choice old potatoes are scarce and very firm: many buyers have an aversion to new, and will pay big prices while fine Peach Blows and E. Rose last, common grades are doing comparatively well. Southern potatoes are of good quality and have a ready sale; good to choice including Norfolk, $3@3.75; culls, $1.25@1.75; Old P. B. & E. R. $2.12@2.37; common sorts, $1.25@1.75; Bermuda potatoes, $4@4.50; do. onions, $1.25@1 37 crate; do. tomatoes, 40@50c. five quart box. Fla. tomatoes, fine crates, $3.50@4; ripe, $1.75@2. Asparagus steady, $1.50@2 per doz. for best including Oyster Bay; other, $1@1.37. N. J. Peas bbl., $3.50@4; Md. do., $3@3.50. Southern cucumbers, 50c.@$1 per crate. Nor. String beans, half bbl. crate, $2.50; Charleston and Savannah bush, crates, $1@1.25; N. J. Beets, 100 bunches, $3@5; Nor folk do., $2@2.50; Rhubarb do., $1.50@1.75. Spinach, bbl., 50@75e.; Southern cabbages, bbl., $1.25@1.75; N. J. Turnips, 100 bunches, $3@4.50; Nor. do., 75c.@ 11.25; Radishes, 100 bunches. 50c.@1; Lettuce, bbl., $1@1.50; Hot-house Cauliflower, bbl., $5@8.

TOBACCO.—Prices have not varied. Export demand is very good in Kentucky Leaf, and the home trade in Seed Leaf more active.

WOOL.—Is very dull, manufacturers holding off for the new Western clip, and prices are weak:

Ohio, Pennsylvania and Virginia quoted at 36@38c., for XX, 35@37 for X, 40@43 for XXX and picklock, 37@40 for No. 1, 31@36, for No. 2, 32@34 for common, and 40@43 for combing.

New York, Michigan, Indiana and Wisconsin. XX, 33@35c.; X, 33@35c.; No. 1, 35@38c.; No. 2, 32@35e; common 30@32c.; combing 38@43.

Iowa, Vermont and Illinois X and XX, 32@34c.; No. 1, 31@33.; No. 2, 30@32.; combing, 37@40.

Missouri, Kentucky, and Tennessee—Washed fleece, 30@35e.; unwashed, 25@26e.; unwashed combing, 28@31c.

LIVE STOCK MARKETS.

NEW YORK, JUNE 1, 1878.

BEEVES.—Receipts for the week, 10,351 head: do., last week, 11,454 do. Thursday was almost a lost day to trade owing to the Floral Celebration and bad, rainy weather has checked business. The market was generally quoted weak at the close, at 8¾@10½e. for medium to extra steers; exporters paying 9½@10¾c. The droves included Colorado cattle at 9@9¾c.; Missouri and Kansas steers coarse, but fat, at 9¾@10c.

COWS AND CALVES.—The nominal range is $40@$70, with an extra milker at $85. Trade unimportant, and there is no call for enlarged receipts.

VEAL CALVES.—Receipts are not oppressive, and and prices are a shade firmer. Choice N. J. 6@6½c.; good, 5½@5¾c.; State range at 1½@5¾c., for poor to best. Buttermilk have varied rates, some down to 2½c. and others up to 3¾@4¼c.

SHEEP AND LAMBS.—Receipts for the week 19,753 head; receipts last week 24,986 head. Market quiet. Common to good clipped sheep 3½@4¾c. Ohio lambs have sold slowly, some Kentucky here missed sale since last Monday. Lambs quoted, N. J. choice 6@7c.; State, 5@5¾e.; Va. and Ky. 4¾@5½e.

SWINE.—Receips for the week 32,285 head; do. last week 35,115 do. No recent sales alive. Nominal rates same as last week's, $3.50@4.50 ₱ 100 lbs.

Strictly Portable.

Power and Press in one.

The Ertel Economy *One Horse* Hay, Straw and Moss Press—the World's Favorite—is the most durable, the handsomest working, the easiest in draught, the lightest in weight, and lowest in price; 10 tons of its Hay will load in any railroad box car. These Presses are daily sold, REGARDLESS OF JEALOUSY shown by Eastern monopolies. The Title of this Press is guaranteed to all.
Above is warranted or no sale. Address
GEO. ERTEL,
Patentee and Manufacturer, QUINCY, ILLS.

USE THE PERFECT BUTTER COLOR!
WELLS, RICHARDSON & CO.'S PERFECTED BUTTER COLOR is recommended by the agricultural press, and used by thousands of the very best Dairymen. It gives a perfect June color, and is harmless as salt. A 25-cent bottle colors 300 pounds, and adds 5 cents per pound to its value. Ask your Druggist or Merchant for it, or send for descriptive circulars. WELLS, RICHARDSON & CO., Prop's, Burlington, Vt.

Sure Death to the Potato Beetle.
The Union Mills Bug Destroyer
Contains Paris Green and other poisonous ingredients, mixed ready for instant use, and is guaranteed to effect a speedy and sure deliverance from the ravages of the Potato Beetle.
Directions for using and a good hand sieve for applying the poison with each barrel.
Price $5 per bbl., delivered on cars. Satisfaction guaranteed or money refunded. Address
JOHN RALSTON, 170 Front St., New York.

The FEARLESS

Railway Threshing Machine proved itself the "Best at Centennial Trial," and was the only Machine awarded a
CENTENNIAL MEDAL
AND CERTIFICATE OF MERIT,
on both Horse Power and Thresher and Cleaner, at the Centennial Exhibition, as shown by Official Report, which says: "*For special features in the Power to secure light running and minimum friction. For the ingenious form of the Straw Shakers, which insure the proper agitation to separate the grain from the straw.*" For catalogue, address MINARD HARDER,
Cobleskill, Schoharie County, N. Y.

Use the Anti-Friction Hay Carrier.
For elevating and conveying Hay, Grain, etc., in barn, barrack, shed or field. It elevates perpendicularly and conveys horizontally any desired distance. No trouble about getting over high beams and to the end of deep mows or to the top of high stacks. Thousands are now in use. Five tons have been stacked and the frame moved in forty-five consecutive minutes. Fifty tons have been stacked in a single day with this Frame and Carrier. SEND STAMP FOR CIRCULAR "D" to U. S. WIND ENGINE & PUMP CO., BATAVIA, ILL.

TRADE MARK.
'VIBRATOR'
Reg. March 31, 1874.

THE ORIGINAL & ONLY GENUINE
"Vibrator" Threshers,
WITH IMPROVED
MOUNTED HORSE POWERS,
And Steam Thresher Engines,
Made only by
NICHOLS, SHEPARD & CO.,
BATTLE CREEK, MICH.

THE Matchless Grain-Saving, Time-Saving, and Money-Saving Threshers of this day and generation. Beyond all Rivalry for Rapid Work, Perfect Cleaning, and for Saving Grain from Wastage.

GRAIN Raisers will not Submit to the enormous wastage of Grain & the inferior work done by the other machines, when once posted on the difference.

THE ENTIRE Threshing Expenses (and often 3 to 5 Times that amount) can be made by the Extra Grain SAVED by these Improved Machines.

NO Revolving Shafts Inside the Separator. Entirely free from Beaters, Pickers, Rattles, and all such Time-wasting and grain-wasting complications. Perfectly adapted to all Kinds and Conditions of Grain, Wet or Dry, Long or Short, Headed or Bound.

NOT only Vastly Superior for Wheat, Oats, Barley, Rye, and like Grains, but the ONLY Successful Thresher in Flax, Timothy, Millet, Clover, and like Seeds. Requires no "attachments" or "rebuilding" to change from Grain to Seeds.

MARVELOUS for Simplicity of Parts, using less than one-half the usual Belts and Gears. Makes no Litterings or Scatterings.

FOUR Sizes of Separators Made, ranging from Six to Twelve Horse size, and two styles of Mounted Horse Powers to match.

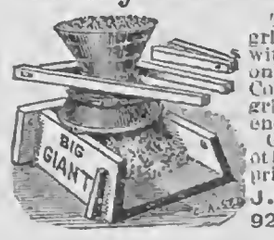
STEAM Power Threshers a Specialty. A special size Separator made expressly for Steam Power.

OUR Unrivaled Steam Thresher Engines, with Valuable Improvements and Distinctive Features, far beyond any other make or kind.

IN Thorough Workmanship, Elegant Finish, Perfection of Parts, Completeness of Equipment, etc., our "Vibrator" Thresher Outfits are incomparable.

FOR Particulars, call on our Dealers or write to us for Illustrated Circular, which we mail free.

BIG GIANT CORN MILL.
Every Man His Own Miller.



The only Mill that will grind Corn with Shuck on without extra expense. The only Mill grinding Corn and Cob successfully that will grind Shelled Corn fine enough for family use.
Grinds twice as fast as any other Mill of same size and price. Manufactured by
J. A. FIELD, SON & CO.
922 N. 2d St., St. Louis.

BEST and CHEAPEST.

Buchan's Cresylic Sheep Dip prevents and cures the scab and all parasitic diseases of the skin.
Buchan's Cresylic Ointment is CERTAIN DEATH to the Screw-worm or Grub.
For further particulars, send for Price Lists and Circulars to
KIDDER & LAIRD, 83 John St., New York.

Reading for the Young.

TWO LITTLE ROGUES.

Says Sammy to Dick,
" Come, hurry ; come, quick !
And we'll *do*, and we'll *do*, and we'll *do* !
Our mamma's away ;
She's gone for to stay ;
And we'll make a great hullabaloo !
Ri too, ri loo, loo, loo!
We'll make a great hullabaloo !"

Says Dicky to Sam,
" All weddy I am
To do, and to do, and to do.
But how doeth it go ?
I so little know ;
Thay, what be a hullabawoo ?
Ri too, ri loo, woo, woowoo !
Thay, what be a hullabawoo ?"

" Oh ! slammings and bangings,
And whingings and whangings,
And very bad mischief we'll do ;
We'll clatter and shout,
And pull things about ;
And that's what's a hullabaloo !
Ri too, ri loo, loo, loo, loo !
And that's what's a hullabaloo !

" Slide down the front stairs,
Tip over the chairs ;
Now into the pantry break through :
We'll take down some linware,
And other things in there—
All aboard for a hullabaloo !
Ri too, ri loo, loo, loo, loo!
All aboard for a hullabaloo !

" Now roll up the table,
Far up as you're able.
Chairs, sofa, big easy-chair too ;
Put the poker and vases
In funny odd places :
How's this for a hullabaloo ?
Ri too, ri loo, loo, loo, loo !
How's this for a hullabaloo ?

" Let the dishes and pans
Be the womans' and mans :
Everybody keep still in their pew !
Mammy's gown I'll get next,
And preach you a text.
Dicky, hush with your hullabaloo !
Ri too, ri loo, loo, loo, loo !
Dicky, hush with your hullabaloo !"

As the preacher in gown
Climbed up and looked down
His queer congregation to view.
Said Dicky to Sammy,
" Oh, *dere* comes our mammy !
Se'll *thcold* for dis hullabawoo,
Ri too, ri loo, woo, woo, woo !
Se'll *thcold* for dis hullabawoo !

" O mammy ! O mammy !"
Cried Dicky and Sammy,
" We'll never again certain true."
But with firm step she trod,
And looked hard at the rod :
Oh, then came a hullabaloo !
Boohoo, boohoo, woo, woo, woo !"
Oh, then came a hullabaloo !

[*Mrs. A. M. Diaz, in "Jimmyjohns," etc.*

"POCKET-MONEY FOR THE YOUNG PEOPLE."—No. 5.

ANNIE L. JACK.

Strawberries—Currants.

There is no crop grown that has the same fascination to an enthusiast as the culture of fruit; and I think strawberries are the most charming and romantic of fruits. There are the color, the aroma, the luscious richness. It is the first fair fruit the summer gives; and no doubt boys and girls think it the fruit they would choose in their efforts towards a little pocket-money.

Well, if so determined, get the "Wilson" *to sell*, for, I am sorry to say, with all its acidity it is the only profitable berry for market purposes. The plants are sold here at one dollar per hundred, and do well in ground where potatoes or corn have been grown the previous season. Any nurseryman, in the fall will sell plants cheap, and after early potatoes are sold off, the land can be prepared in rows as if for corn—the plants set a foot apart and kept clean. A covering of leaves, swamp hay, or branches, is necessary to protect them when the climate is such that there is danger of frost. Many people cover with straw, but *any thing that does not contain weed seeds* is much better. The mulch is simply drawn aside in spring, and left between the rows to keep the fruit clean, retain moisture, and prevent weeds.

Of the profits I cannot say, as the price is so variable in different localities; and the neatness of sorting, and size and freshness, make quite a difference. The returns are quick, as the second year from planting the berries are extra fine, if not so plentiful as afterwards. But when you plant, remember, that in fruiting season the plants will require constant attention. You must pick, pick, through the heat of the July days, no matter what may lure you away. A day's delay, and your berries will lose their fresh look, and as they cannot be picked in early morning—for the dew—it is often a tiresome job in sun and heat. Then cases and boxes cost something; and a consignment from some land of plenty may flood the market and bring down prices.

But if you have customers who wish good, fresh berries, and know them when they see them, I should say "Grow strawberries." They are a delightful attraction to visitors and birds, and sweet and fragrant to taste and smell, always salable and eatable, and I remember one season when some boys and girls I know, picked ninety dollars' worth from not quite half an acre of land. After the berries are off, the cultivation must be *thorough*, runners cut, plants kept clean all through the summer; and it is wise to set out a new bed, to be coming into bearing before the old one is exhausted.

There is another fruit crop that repays all the trouble it requires, and any boys and girls who can get cuttings of currants, white, red or black, I should advise to set them out in straight rows, *wide* enough to be cultivated by horse power. There are plenty of customers to be found for these fruits, and people prefer to get them fresh picked from the garden to going to market for them.

All the suds and slops from the kitchen are useful to make them grow, and if the worm appears, hand-pick the leaves that are infested and water the bushes with white hellebore dissolved in soapsuds. It is surprising how soon a young currant bush will bear a gallon of berries; and they are generally large if well fed, while prices per gallon, in my experience, range from 40c. upwards, for fine, fresh fruit. They are easily handled, clean to pick, do not spoil if left a day on the bushes, and repay well extra care and culture.

THE ART OF DECEPTION.

One of the most singular inconsistencies to be observed in every-day life is found in the different manner in which the habit of deception is regarded according to the age and position of those who practise it. Children, as soon as they become capable of distinguishing right and wrong, are taught to look upon deceit as one of the worst sins that can be committed. Boys at school are not only taught the beauty of truth by their masters, but, in a certain rough fashion, reverence it among themselves. A boy, for instance, who parades ostentatiously to his master an assumed steadiness of principle and submissiveness of demeanor is very soon branded with the odious title of sneak. On the other hand, occasions arise in schoolboy life when by sticking to a deliberate falsehood, a boy may gain for himself the reputation of a hero among his fellows. This, however, is a detail of the curious system of schoolboy morality, the unwritten laws of which might afford an interesting matter for study.

Girls, it would seem, are by nature more inclined to untruthfulness than boys; but this inclination is really very often the result of moral cowardice, a defect which it may be said is as common to boys and men as to girls and women. But in the one case there are deterrent influences, absent in the other, which often lead to the attempt at overcoming, or at any rate concealing, this fault. A boy who has invented a story to save himself from a scrape, and is found out, is generally made to feel in some tangible way that he has been guilty of a gross blunder, if not of a crime. He becomes conscious that his conduct has gained him nothing but a punishment and the scorn of the community. With girls the matter is somewhat different; some form of punishment may be inflicted, but the sense of having done a shameful thing is less frequently and less strongly inculcated. A girl who has been detected in a falsehood may be teased on the subject by her companions, but she will not be shunned and despised. Thus she is very likely to learn early in life the great maxim that it is not crime but detection that one ought to avoid.

She Likes to Work in a Garden.

Dear Uncle True.—I want to tell you how dearly I like to work in a garden. I have raked all the leaves and picked up all the stray sticks and I am watching the flowers every day. Why can't we Rural Cousins gather flower seeds to exchange, or garden seeds. I help make the vegetable garden. I for one can save lots of seeds.

I am going to have a swing and a croquet ground, so I have a pleasant time with my company, and do not disturb the grown people. Some one give us directions for rustic summer-house of poles, and oblige NIAGARA MOLLIE.

The Puzzler.

ENIGMA.

In the middle of day I always appear,
Yet am ever in darkness, in sadness, and fear.
I am in anguish and pain, yet always in health;
In the midst, too, of happiness, pleasure and wealth.
I was formed since the flood, yet am part of the ark,
And seen in a cradle, a lamp, and a spark;
Though never out of England, I'm always in France,
Stay in Paris and Amiens, Bordeaux and Nantes.
I'm found in the foam and the waves of the ocean,
In steamboat and cars, yet am never in motion.
I'm always in land, yet ne'er out of water,
And without me you can't name a son or a daughter.
In short, I'm in all things; there's no lake, or sea,
Or island, or cape, but contains little me.

☞ Answer in two weeks. R. A. Dukate.

MISCELLANEOUS ENIGMA.

I am composed of 84 letters:
My 12, 26, 61, 51, 11, 5, 14, 6, 84, 18, 8 a sail of a ship.
My 41, 1, 42, 6, 35, 30, 57, 37, 43, 29, 22, 19 a circular edifice used for public amusements.
My 7, 27, 72, 31, 13, 36, 2, 4, 29, 34, 15 unhealthy.
My 64, 73, 74, 46, 61, 44, 79, 21, 33, 38 real merit.
My 25, 55, 83, 28, 22, 47, 50, 48 an act of charity.
My 49, 17, 67, 16, 52 an umpire.
My 77, 58, 24, 54, 59, 70 untwisted end of a rope.
My 80, 78, 71, 56 a point of compass.
My 68, 65, 76, 75 excellent.
My 82, 10, 53 to decline.
My 62, 63 a French conjunction.
My whole is good advice to young men.

☞ Answer in two weeks. Little One.

TRIPLE ACROSTIC.

1. Reckoned. 2. To mix with oxygen. 3. Slander. 4. Raw metal. 5. Uncooked. 6. A man's name. 7. A general name for a negro and a consonant. 8. To weigh down. Primals, centrals and finals form three States.

☞ Answer in two weeks. Balto.

Sabbath Reading.

"COME UNTO ME."

ELEANOR KIRK.

A sweeter song than e'er was sung
By poet, priest or sages:
A song which thro' all Heaven has rung
And down thro' all the ages.
A precious strain of sweet accord,
A note of cheer from Christ our Lord;
List! as it vibrates full and free,
O grieving heart, " Come unto Me."

O wise provision, sweet command,
Vouchsafed the weak and weary;
A friend to find on either hand,
A light for prospect dreary.
A friend who knows our bitter need,
Of each endeavor taking heed;
Who calls to every soul oppress,
" Come unto Me; I'll give you rest."

" Come unto Me." The way's not long.
His hands are stretched to meet thee;
Now still thy throbbing, list the song
Which everywhere shall greet thee.
Here at his feet your burdon lay,
Why 'neath it bend another day,
Since One so loving calls to thee,
" Oh! heavy laden, come to Me?"

A sweeter song than e'er was sung
By poet, priest or sages;
A song which thro' all heaven has rung
And down thro' all the ages.
How can we turn from such a strain,
Or longer wait to ease our pain?
Oh! draw us closer, Lord, that we
May find our sweetest rest in Thee.

[*Congregationalist.*

PRAYER.

"He that cometh to God."—Gen. xl. 6.

There would be less of formality in prayer, and far more of strength and enjoyment in it, if men did but grasp the idea of what prayer is. But simple as the idea is, it requires an effort of mind to master it; and while we are willing enough to pay mechanically our daily tribute of homage at the Throne of Grace, natural slothfulness always recalcitrates against an effort of mind. Gradual ascent is as necessary to the mind, in order to its reaching a great idea, as it is to the body, in order to its reaching a great hight. We cannot ascend to a pinnacle of a cathedral, which towers aloft in air, without either steps or an inclined plane. Now the law of man's bodily progress is also the law of his mental progress. Both must be gradual. No grand idea can be realized except by successive steps and stages, which the mind must use as landing-places in its ascent. But what if the mind, after all its toil, should prove unable fully to master the idea, as must be the case where the idea to be mastered is connected with God and things divine? It does not at all follow that therefore our labor is lost. We have, at all events, risen to a higher level, where our view is more transparent, more elevating, more sublime, and where the play of the thoughts is invigorating to the inner man. And now let us apply these reflections to the subject in hand.

Prayer is nothing more or less than a "coming to God." Now the bare conception of this thing, "coming to God," is sublime and ennobling to the highest degree. But we are familiar with the idea, and our very familiarity with it—the currency of it among religious persons and in religious books—has worn off the sharp edges of it, until it has ceased to have any definite impress. Let us seek and pray that the idea may revive with some power in our minds. And this we will do by a series of hypotheses, which shall be as landing-places for the mind in its ascent.

1. Let us suppose as the first step that we enjoyed the privilege of opening our minds to, and consulting in our every difficulty and trial, the very wisest, and best, and most powerful man upon earth. Suppose that such a person resided in our immediate neighborhood, so as to be at all times easily accessible to us. Suppose that his doors stood open day and night, and that he had left instructions with his servant never to deny him to us. Suppose that, from his repeated invitations, coupled with the well-known sincerity of his character, we were perfectly assured that he would give his whole mind to any case which we might lay before him, and consult for us to the best of his ability, and with the keenest interest in our welfare. Can there be any doubt that the doors of this wisest, and best, and most powerful of all men would be besieged with applications for admission to his presence, and that even where persons in distress were not immediately extricated by his advice, it would be a great relief to their minds to hear him say, "This is an intricate case, and will require a great deal of management; but be assured I will bear it in mind, and take such measures in it as are most for your welfare?"

2. But the judgment of even the wisest and best men, while in the body, is liable to be disturbed by many influences, which death will set aside. Mixed up inevitably with earthly interests, and looking at things more or less through the medium of public opinion, they are not now as impartial judges of truth and right as they will be, when separated altogether from the world. Let us imagine then this great separation to have taken place,—the just man to have been "made perfect," and to be now lying in Abraham's bosom, his mind stocked not only with the experiences of life, but with the thousand additional lessons which death will convey. Imagine his spirit to be accessible after death to those in whom he felt, while living, the strongest interest. Let us suppose, to make the image more definite still, that he is a father, who has always had during life, a word of counsel and sympathy, and a hand of succor for his children; and that it has so come to pass that death has not cut them off from this resort. Doubtless, they would avail themselves of the privilege with great eagerness; the difference between the consultations with the living and the departed parent being chiefly this, that a certain awe would rest upon their minds in the latter case, from the reflection that they had to do with the inhabitant of another world, and that the advice given would be doubly valued, coming (as, on the hypothesis, it does) from a sphere where all errors of judgment are thought to be corrected.

3. And now for another step in our ascent. The Scriptures speak largely of angels, a class of beings whose faculties transcend ours in our present state; and certain words of our Blessed Lord are upon record, which, though they cannot be said to prove, yet, certainly, favor the popular idea of the Jews, that to each person is assigned a guardian-angel. Assuming, then, for the sake of argument, that such guardian-angels exist, let us suppose that each of them feels a special loving interest in the particular soul under his guardianship, trembles for it as in the mad frenzy of transgression it hangs upon the brink of eternal ruin, and rejoices for it, and with it, as it is plucked away from that brink by the arm of the good Shepherd, and brought back to the fold from which it had strayed. Suppose, again, in this case that we had each of us some power of access to this guardian-angel, that we could summon him to our aid,—lay our difficulties before him, unburden our minds to him, with the assurance of receiving from him both sympathy and succor. Can it be supposed that we should not avail ourselves of such a privilege, as opportunity offered? that we should never call him to our councils, or submit to him our cares?

4. But we have now climbed by gradual stages to the summit of the mountain, and are left to contemplate a privilege, which not only might be, but which is our own, and yet of which (partly from its very cheapness and commonness) we either do not avail ourselves at all, or avail ourselves in a formal and mechanical manner. "He that cometh to God." Inasmuch as God is the Infinite One, we can never by any reach of the mind grasp entirely the idea of coming to Him; but have we not desired some help, some clearness of view, some apprehension of the magnificence of prayer, from the train of thought which we have been pursuing? Created power, wisdom, love, all have their limits, beyond which they cannot help, counsel, or sympathize: our difficulties, our perplexities, our sins, might easily outrun them; and access to them might not be nearly of so much value as we are apt to imagine. But, "he that cometh to God"—what shall I say of this privilege? The tameness of human language is disappointing when we attempt to describe it. Throw into one great sum total all that you have ever experienced, or can conceive, of wisdom and power, the most far-sighted discernments of results, with the most absolute control over them,—the keenest intuition into character, with every conceivable influence for molding it,—and then invest Him in your conceptions with an intensity of love, which is not discouraged by the deepest moral degradation in its objects, and which clings to the person of the sinner with unchilled devotion even while it condemns his sin with an abhorrence no less than infinite,—imagine such a Being, and imagine Him accessible to man, and you imagine One, to whom in their hour of need all the world, unless indeed the spell of some deadly fascination were laid upon them, would be resorting continually for guidance, help, and comfort. But this is no imagination. It is a reality. God is such a Being as we have labored to describe. He not only permits, but invites; not only invites, but commands, the approach to Him of every comer. And if there be no promise that every prayer shall be heard according to the exact tenor of its prescription, yet assuredly there is a promise to all who ask,—most simple,—most express,—most universal,—of that nourishment of grace for the human spirit, which is the alone support of spiritual life: "If ye then, being evil, know how to give good gifts unto your children, how much more shall your Father which is in Heaven give the Holy Spirit to them that ask Him?"

E. M. G.

PERSONAL ITEMS.

Mr. Ralph Waldo Emerson reached the age of 76 years last Saturday.

Mrs. Nellie Grant Sartoris, the daughter of General Grant, is now visiting Paris, with her father and mother.

Ericsson, the inventor, is 75 years old and wonderfully strong and hearty. He never drinks anything but water.

Brother Jasper says he knows enough to keep out of jail, and that's where he's ahead of old Galileo, at any rate.

Thos. Carlyle says:—Make yourself an honest man, and then you may be sure there is one rascal less in the world.

Peter Cooper says his simple rules of business have been to avoid debt and idleness. And P. Cooper is worth ten millions.

Mrs Bright was one of the oldest and stanchest teetotalers in the United Kingdom, having tasted no spirits for forty years.

Barring himself and Mr. Blaine of Maine, there isn't much in this universe from the Creator down that is just as Col. Ingersoll would have made it.

Capt. Catesby Jones formerly Commander of the famous confederate ram Merrimac, was killed in Selma, Ala., last summer by J. A. Harral a neighbor.

The late Professor Henry made twenty-two inventions and discoveries, none of which he patented, preferring to leave the fruits of his science to all who would profit by it.

The "B's" are all big men in Massachusetts. They have had Butler, Banks, Boutwell, Burlingame, Bullock, Bird, Bowles and Beard, and the head of the new Prohibitionist party and its first candidate for Governor was named Baker.

Among the English aristocracy Earl Granville ranks as the best linguist; he is master of twenty languages. In appearance he looks like an oiled and curled Assyrian bull. The parting of his hair has never been known to change one hair's breadth.

The four most distinguished brothers in this country—Judge Stephen J. Field, of the United States Supreme Court; Mr. Cyrus W. Field, of Atlantic cable fame; Mr. David Dudley Field, the lawyer, and the Rev. Henry M. Field, of the New York Evangelist—met at Haddam, Conn., the other day to make arrangements for the purchase of a plot of ground for a public park to commemorate the work of their father, who for many years was the pastor of a church at Haddam.

Ex-Senator Simon Cameron had three sons and three daughters. Don is the oldest. His second son, Brewer, was made a paymaster in the army while his father was Secretary of War. The third has never been in public life. The daughters were Mrs. Burnside, Mrs. Halderman (whose husband was a Democratic member of Congress), and Mrs. Wayne M'Veagh. Don Cameron had six children by his first wife, who was a Miss M'Cormick, and who brought him a fortune of $750,000. General Simon Comeron is a man of large wealth.

What monarch did he symbolize?
(A far-fetched joke you'll style it.)
It seems to me he might have been
A sort of *paunch's pilot.*—*Yonkers Gazette.*

A DUTCHMAN, having lost his horses, started in search of them. Meeting a man in the road he inquired of him if he had seen them. Being a stranger in those parts, the man asked Hans to describe them. "Vell," said he, "dey was very mooch alike, 'specially the off one. Von looks so mooch like poth, I can't tell toder from which. Ven I vent after the one, I alvays caught de oder; an' I whipped de one most dead because de oder kicked me. Seen anything of dem, hey?"

THE Bishop of Exeter tells a good story of a speech which was once maue to him. He had gone to stay in a country parsonage of his diocese for a confirmation or some other clerical function, and the "house and parlor maid" had evidently been strictly enjoined on no account to omit to say "My Lord" when addressing the Bishop. In the morning, while going down to breakfast, he met the damsel on the stairs, and asked her whether she could tell him who had taken his letters to the post the night before. The answer, given smilingly, was, "The Lord, my boy!"

"You cannot, oh, day star of my life!" he pleaded, throwing himself at her feet; "you cannot refuse the rich, exhaustless mine of love I pour at you feet; you cannot turn from the rare treasures of my heart's devotion that I cast before you; you cannot turn away from all this lavish wealth of heart and hand that is yours to take, and say me nay!" She couldn't and she didn't; it sounded too wealthy. That was nearly four years ago. Day before yesterday he gave her $3.85. to run the house a week and when she said she would have to have a new pair of shoes, he raised the appropriation by an oven dollar, and grumbled about woman's extravagance till he was out of hearing. Oh, woman, woman, thou art of tender heart and trustful soul, if you don't scalp a man raw every time you get a chance, you are a little idot all the samo.

The Prevention of a Terrible Disaster.

No disorders, excepting the most deadly forms of lung disease, involve such a tremendous destruction of organic tissue as those which fasten upon the kidneys. Such maladies, when they become chronic—and none are so liable to assume that phase—completely wreck the system. To prevent this terrible disaster, recourse should be had, upon the first manifestation of trouble, to Hostetter's Bitters, which experience has proved to be highly effective as a means of imparting tone and regularity to the organs of urination, as well as to the liver, stomach and bowels. Another beneficial result of this medicine, naturally consequent upon its diuretic action, is the elimination from the blood of impurities which beget rheumatism, gout, dropsy, and other maladies. By increasing the activity of the kidneys, it augments the depurative efficiency of those organs, which are most important outlets for the escape of such impurities.

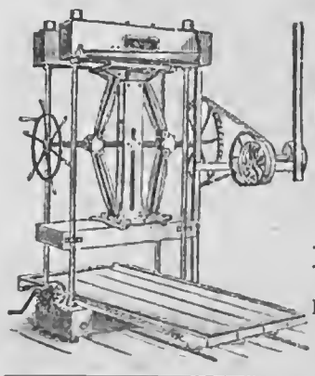
The "Eclipse" Victorious
(See Centennial Judges' Report.)
STRONGEST WIND MILL MADE.
Tested 10 years. Thousands in use. A solid wheel without joints. Produces 15 per cent. more power, and will not blow away.
WE BUILD 13 SIZES MILLS
for pumping and power purposes.
Illustrated Circulars free.
Eclipse Wind Mill Co., Beloit, Wis.

The Rectangular Churn
Simple, efficient and *always reliable.* No inside fixtures. Fifty per cent. in labor saved over *any other churn.* 5 sizes made. The Highest award given over all competitors at the late Dairy Fair in Chicago. An energetic man wanted in every town, to act as agent. One churn sent at wholesale where we have no agent. CORNISH & CURTIS,
Fort Atkinson, Wis.



POWER Cider and Wine PRESS.
WITH
Double Platform
BOOMER & BOSCHERT PRESS CO.,
Syracuse, N. Y.

STRAUB MILL COMPANY, CINCINNATI

See Illustrated article in RURAL, May 11.

THE AMERICAN HAY ELEVATOR.

The most perfect, simple and ONLY Elevator that raises the hay from wagon and carries it in barn any required distance. Economical, durable, labor-saving. Send for Illustrated Circulars and prices to
J. R. FITZHUGH,
1708 Barker St., Philadelphia, Pa.
Branch Office: 55 Beekman St., New York.

TEAS This is a combination of capitalists to supply *consumers only* throughout the *United States* with **PURE TEAS** on the mutual principle, by getting up clubs. Send for New Price-List.

CONSUMERS' IMPORTING TEA CO.,

BULBS FOR THE FLOWER GARDEN.

W. C. L. DREW.

ANTHERICUMS.

A HANDSOME genus of plants for the border, which have been far too much neglected, are the different varieties of the Anthericum. All the varieties are perfectly hardy, requiring only to be planted in a tolerably rich, light, loamy soil to thrive and greet the happy owner, year after, with their stately spikes of bloom.

Of the Anthericum I am only acquainted with three varieties, differing materially in the size and form of the flowers, the color being the same in the several varieties, a pure clear white. Frequently, however, they have a rosy tinge, the result of planting them in a soil containing more or less charcoal.

The best known of the Antherieums is A. liliago popularly know as the St. Bernard Lily. It grows about sixteen inches high, the flowers which are rather small, are borne on spikes.

A. liliastrum, commonly called St. Bruno's Lily, bears a much larger flower than the first. It attains a hight usually of twenty or more inches; the flowers are lily-shaped and very elegant.

A. ramosum also has white flowers, small but more densely borne on the spike than in the other varieties. It grows from sixteen to eighteen inches high.

The Antherieums are highly prized, where crown, for bouquet and cut-flower decorations, for which purpose they are invaluable. For cemetery purposes they will also be found very satisfactory. They should never be used for lawn decorating, as cutting the leaves, which would be inevitable, injures the bulb.

BULBOCODIUM.

Very attractive is the pretty flower of the Bulbocodium vernum or spring Colchicum. It is one of the earliest to flower of the spring-blooming bulbs, coming in bloom from ten to fifteen days earlier than the favorite Crocus. The flowers are of a rich dark purple color, some specimens having black purple veins or markings.

Plant the bulb two inches deep, in a light, sandy soil; the bulb should be planted early in October; it will produce finer blooms if undisturbed for several years.

TRITONIA

The Tritonia, a variegated species of the Iridece or Cape Irids, has recently been introduced, hereabouts. It requires treatment similar to that needed by the Ixia, which was described in a late number of the RURAL NEW YORKER. The flowers, which are rich in color and of all the hues of the rainbow, are very beautiful. For window-garden and conservatory decoration, they are fine; or planted in pots, they may be used in many ways in the garden.

The Tritonia was introduced into general culture from South Africa, a number of years ago. Under the skillful manipulations of European cultivators, varieties have been produced which far surpass the old introductions, in variety and brilliancy of color. In fact, so wonderful has been the improvement in some varieties, that an unskilled amateur would take them for new species of plants. There are some thirty varieties in cultivation.

CONNECTICUT AGRICULTURAL EXPERIMENT STATION.

NEW HAVEN, June 8, 1878.

Bulletin No. 15.—Fertilizer Analyses.

141. PERUVIAN GUANO. Guaranteed 8.2 per cent. Nitrogen. Sold by Olds & Whipple, 164 State Street, Hartford. Sampled and sent May 24, by Andrew's Bros., Southington.

146. STOCKBRIDGE POTATO FERTILIZER. Claimed 4.5-5.25 per cent. Nitrogen, 7-8 per cent. Potash, 2-3 per cent. Soluble Phos. Acid, 4-5 per cent. insoluble Phos. Acid. Sold by Olds & Whipple, Hartford.

148. AMERICUS AMMONIATED SUPERPHOSPHATE. Claimed 9-11 per cent. Available Phos. Acid, 2.1-2.9 per cent. Nitrogen, 2-2.5 per cent. Potash. Manufactured by Rafferty & Williams, N. Y. Sold by Rodney Kellogg, Hartford.

142. CASTOR POMACE. Manufactured by H. J. Baker & Bro., N. Y. City.

143. BONE MANURE. Manufactured by G. W. Baker, Williamsburgh, N. Y.

145. ROTTED BONE MANURE. Manufactured by G. W. Baker, Williamsburgh, N. Y.

147. BONE MEAL—AMERICUS BRAND. Claimed "Bone Superphosphate of Lime 50-58 per cent.," 2.9-3.7 per cent. Nitrogen. Manufactured by Rafferty & Williams, N. Y. Sold by Rodney Kellogg, Hartford.

142, 143, 145, 146 were sampled and sent by S. M. Wells, Wethersfield, May 28. 147, 148 were sampled and sent by J. J. Webb, New Haven, May 2.

	141	146	148	142	143	145	147
Nitrogen	3.55	3.49	2.16	4.59	3.26	2.05	3.05
Soluble Phos. Acid	5.37	5.15	5.12				
Reverted " "	4.57	1.24	1.40				
Insoluble " "	3.40	0.18	3.49	1.50	11.85	2.43	22.65
Potash	3.14	10.22	2.01				
Cal. Value ₹ ton.	$63 29	44 65	31 87	21 06	28 33	10 78	42 69
Cost " "	$54 50	50 00	38 00	22 00	25 00*	10 00*	38 00

*Wholesale.—In 141 Potash is valued at 4¼ cents per lb.

In 146 and 148 potash is reckoned at 7¼ cents for comparison with similar articles previously reported, but 4¼ cents is high enough for the Conn. market at present.

S. W. JOHNSON

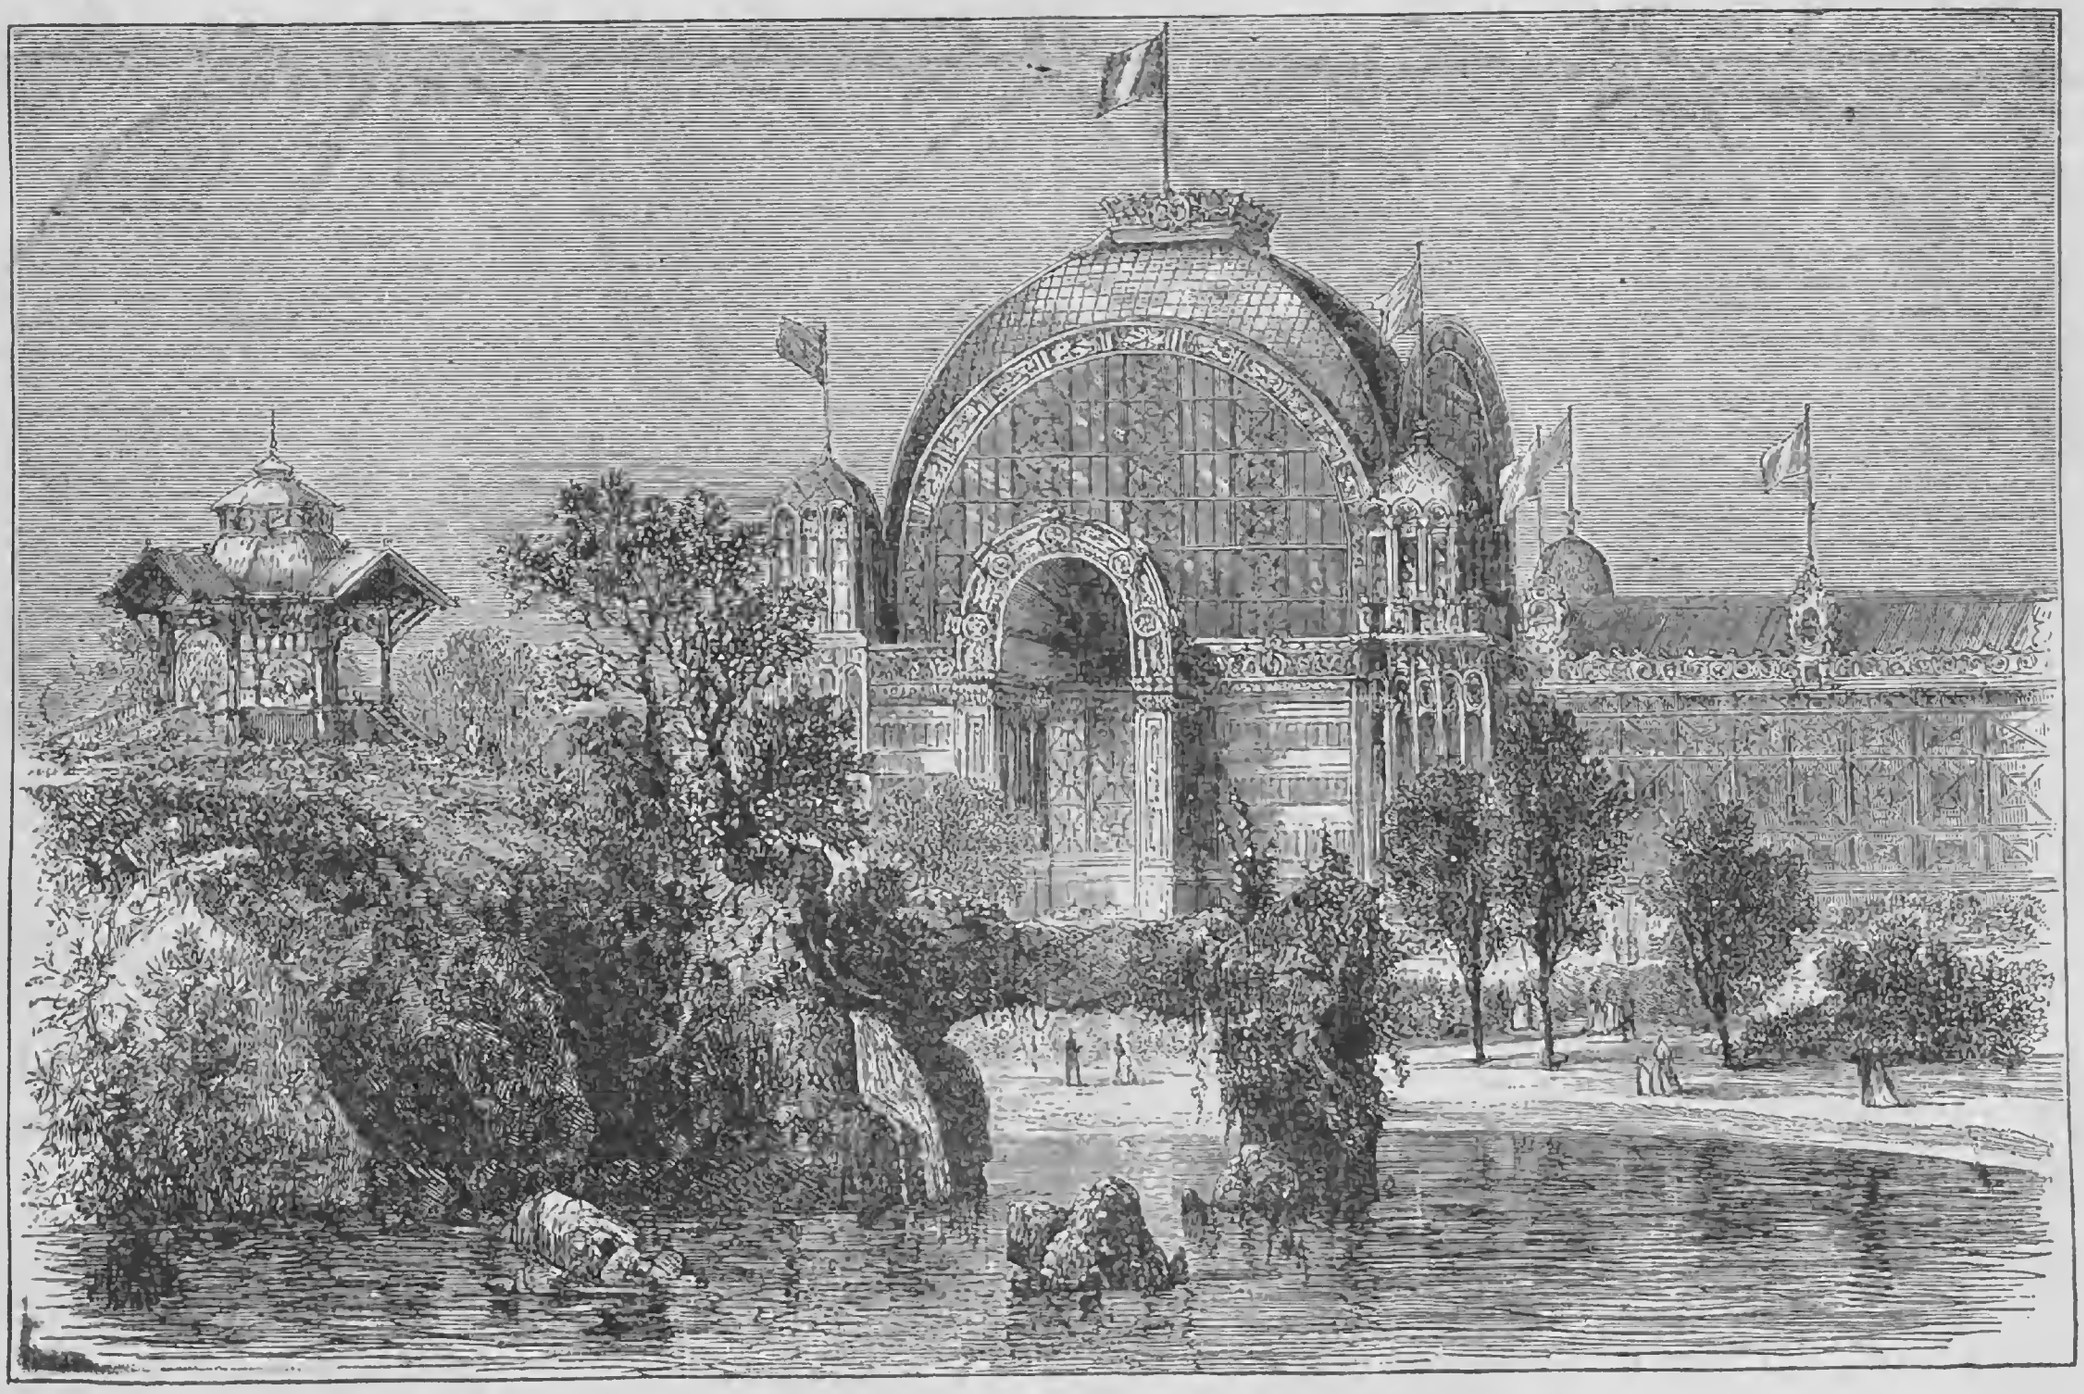
STRAWBERRY BLIGHT.

LAST week E. & J. C. WILLIAMS of Montclair, brought to this office several dozens of strawberry plants, many of the leaves of which were withered and dry. These were specimens merely of many plants in their vicinity affected in the same way. What was the cause? We said frosty and cold nights. They said disease. We have since received the following letter:

EDS. RURAL.—Further consideration of the strawberry blight only confirms our opinion that it is not caused by frost, as we remember having first noticed it several years ago on the Agriculturist variety which seemed peculiarly subject to this ailment, and we were compelled to discontinue the growing of this fruit on that account. We have seen the disease on Chas. Downing every year to a limited extent, but this year the destruction is complete. We think Boyden's No. 30 to be about the only sort in our place that is exempt this year.

E. & J. C. WILLIAMS.

Upon further inquiry, we have grave fears that these plants were affected with the same sort of rust or blight as those in several parts of the West, respecting which some account has been received this season.



A SKETCH IN THE PARK OF THE PARIS EXPOSITION.

Industrial Topics.

THE FRENCH EXPOSITION.

FINANCIAL CONSIDERATIONS.

PARIS, May 27th, 1878.

AT home, it is not an uncommon saying that in society the chief question with regard to a stranger is, in Boston, "What does he know?" in Philadelphia, "Who was his grandfather?" and in New York, "What is he worth?" a form of interrogation which plainly shows that while the Modern Athens and the Centennial City are merely provincial in their curiosity, the capital of the Empire State is the true representative of the nation in its inquisitiveness as well as in other respects; for to the average American the value and excellence of an object depend mainly on its money worth. Hence with regard to the French Exhibition "What did it cost?" is a very legitimate question in the minds or months of RURAL readers.

The first estimate of the cost of the palace on the Trocadero and the vast piles of buildings on the Champ de Mars was presented to the Corps Legislatif, on the 6th of June, 1876, and amounted to 35,313,000 francs. This was a trifle of about twelve million francs in excess of the cost of Louis Napoleon's Exhibition in 1867; but the republican show covers in the neighborhood of 125,000 yards more than the last international fair under the empire. During 1877 applications for space poured in very rapidly from at home and abroad, and before the close of the year it was found that the projected accommodations would be insufficient to satisfy all demands, and accordingly, 44,000 square yards, in addition to the original design, were covered with annexes intended chiefly for the display of machinery and other cumbersome exhibits. This necessitated a considerable increase on the original estimate, and the last statement of accounts which has come to my notice, shows that by the middle of May, 44,795,000 francs had already been disbursed; and as a considerable amount of labor even then still remained to be done before the completion of the works, the total expenditure for the buildings, their appurtenances and the embellishment of the grounds will certainly not be less than fifty million francs.

In addition to this first outlay, the expenses connected with the management of the institution, and the fetes projected during its continuance, will be very heavy. Among these incidental disbursements will be a sum of 1,500,000 francs appropriated for prizes; an allowance of 500,000 francs to President McMahon to defray the cost of balls, banquets, and other official festivities; 250,000 francs for the same purpose to Minister of Foreign Affairs; a like sum to the Minister of Agriculture and Commerce, and 100,000 francs to each of the other Ministers. In addition to this, there will be a bonus of ten per cent. on their salaries for six months to all the minor employes of the government, resident on Paris, while the cost of fireworks, illuminations, and other public displays, must aggregate an enormous sum.

Talk either of fighting or making any other great national effort merely for an idea or *pour la gloire*, has gone out of fashion here with the Empire which made insincere pretensions to this kind of Quixotism, and accordingly the means of recouping this large expenditure are freely discussed. During the first Exhibition, in 1855, the sale of tickets produced 3,200,000 francs; the same source during the second Exhibition, in 1867, yielded 10,765,000 francs, and this year it is expected that upwards of 4,000,000 francs will be in this way collected. Moreover, 1,235,000 francs, at least, will be gained from rents of different establishments, such as restaurants, drinking places, etc., not directly connected with the buildings; the materials of the latter when they shall be demolished, are put down as worth 4,000,000 francs; 6,000,000 francs are expected as an appropriation from the city of Paris, which contributed a like amount to the last great show; and the remaining 10,000,000, or more, are to be made up from special taxes on the receipts of railroads, passenger boats on the Seine, omnibus lines, hacks, and other public vehicles in the city, all of which reap a rich harvest from the pockets of the visitors attracted from every quarter of the globe to witness this grand display.

But away beyond the sordid consideration of immediate return of outlay, are the beneficial effects so vast an exhibit of the very best results of the world's invention, ingenuity, skill, and industry must have upon the arts, sciences and manufactures of the country. While to the general public the Exhibition is chiefly a source of amusement, and only indirectly an element of instruction, to the shrewd denizens of the workshops of France it is a glorious school in which they will learn many a lesson which will enable them to win a still higher reputation and gain a yet wider market for their productions. And while the country at large is in this way educated and benefited by this World's Fair, Paris must reap an especial harvest of pride, pleasure, instruction and shekels.

To secure the last object, the hotels and most of those who let furnished rooms have just about doubled their ordinary prices, nor will they lease their rooms for more than a month in advance. "We made nothing last year, we shall make the same next, therefore we must make all we can this season, and were we now to rent our rooms for a long time, we would be throwing away a chance of getting much more for them" is what is sometimes openly said, and often indirectly expressed by these makers of hay in the sunshine. Yet even a stranger in Paris, provided he possesses some natural shrewdness and *savoir faire*, can get along very comfortably for a moderate sum—say $150 a month; and pass the time very agreeably, seeing everything worth seeing, for considerably less. To accomplish this it would be necessary to hire a room either in a *maison meublee* or in a small hotel in one of the quiet streets that can readily be found not far from the gay boulevards. Such a room is generally cosier and better furnished than one costing two or three times the price in one of the huge caravansaries on the main thoroughfares. Meals should be taken at any of the excellent restaurants that abound throughout the city, especially around the Exhibiton buildings, many of which have made only a modest addition to the prices on their bills-of-fare. To the sight-seer wandering about at his own sweet will, such a practice is far more pleasant and convenient than the necessity of sitting down to the table at stated times. A clean, palatable dinner with quite enough courses to satisfy any guest, can be obtained at any of the sixteen *Etablissments Duval* in different parts of the city, for two and a half to three francs—about half a dollar—and at many other excellent dining-rooms easily hit upon by the wide-awake visitor, prices are equally reasonable.

Even to those whom circumstances prevent from making a pleasure trip to a scene of interest which attracts thousands of their countrymen, there is a certain satisfaction in learning the price the excursionists must pay for their gratification and the consequent saving made by the "stay-at-homes." To gratify this very natural sentiment, a fair estimate of the expenses of a trip to the Paris Exposition can be made from the following data: A first-class excursion ticket from New York to Liverpool and back, can be had for from $110 upwards, according to the line of steamers patronized and the situation of the state-room; the railroad fare from Liverpool to Paris, via London, Dieppe and Rouen, is $15.50 by first-class carriages and $11.50 by second-class; comfortable board and lodging in Paris, say $3.50 per day; incidentals measurable by one's inclination and the length of his purse. This would be the cheapest rate at which the trip could be made in a comfortable, gentlemanly fashion. No sooner, however, does the average American plant his foot on the soil of effete Europe than he patriotically feels himself the representative of the grandest country in the world, and is inclined straightway to squander his money with a liberality supposed to be in harmony with the proud character he has assumed.

THREBER.

Farm Topics.

JOTTINGS AT KIRBY HOMESTEAD.

COL. F. D. CURTIS.

WE are trying an experiment which we think must be a success. Last year the mangels came up very uneven, and some did not come up at all. The carrots were a bad failure. At first we were inclined to lay all the blame to the seed, but after a while, when we saw that the seed came on nicely in bunches, and then made a skip for a number of feet without any signs of life, we concluded the fault was in the covering; either the drill, or the man who used it, did not work right. The carrot seed were sowed two weeks ago by hand, and covered by hand. They are now up and look fine; every seed was covered. It was slow work but it has insured success so far the carrots getting a good start. The mangel ground was ridged yesterday and rolled with a heavy roller, and to-day the seed is going in. A shallow furrow is made with a hoe, and in this, just a foot apart—a man's foot—three seeds are dropped. They are then covered with a hoe a half an inch deep, as nearly as possible, and the surface smoothed and patted with the hoe. The seed have been soaking in water for four days, and being rolled in white plaster they are readily dropped and easily seen in the furrow. It will not take more than half the seed to plant in this way the same amount of ground and the work of thinning out and weeding will be largely reduced. This is not all: the seed will come up sooner and evener and so get ahead of the weeds, and this will lessen the amount of labor in tending.

The worms have started to eat all of the leaves on the currant bushes. It is said strong soap-suds will drive them off. Our currants had been small and poor for several years, until the ground was thickly covered underneath them with manure, and the first season they were very large and much improved in quality. Fruit of under-size is always of inferior taste. Chip manure is excellent for putting around them.

A Chinese Yam was planted a dozen years ago, and although we have dug for it several times we never found it, but somehow or other it has made its appearance every season and the vine being ornamental, it has been allowed to grow. This year it has not come to hand and perhaps it has changed about and gone the other way to adorn some Celestial garden.

We spent five minutes in the Dorking hennery spading up the ground, and our little effort gave the fowls a cropful of worms and a spot of fresh earth in which to scratch and wallow. A few green sods were thrown in, and this addition to the dry grain is not only healthful but necessary if hens confined are expected to lay many eggs.

The butcher is now taking the lambs at $3.50 each. Last year we only got $3 25, and meat is lower this year, but the lambs came two weeks earlier and had better care and so they are larger and fatter. This price makes the sheep pay the best of any stock; for in addition to the $3.50 for a lamb, the sheep will average $1.50 each in wool. They ate the straw and made a grand lot of the best manure. Our sheep are of mixed blood with the largest share South-down. We want enough Merino to thicken the fleece and South-Down to make a meaty or plump lamb, and then a cross of Leicester or Cotswold to furnish a good udder and ability to give milk, and then we will have the best kind of sheep for practical utilty.

This is the time of the year for kicking cows. There are various ways to prevent the trouble, but the best one undoubtedly is to tie a small rope tightly around the body just in front of the bag. Some people buckle a strap around the two hind legs, and others tie one fore leg up, so the cow must stand on three legs. This way strains the animal, as she will struggle to free herself and fall down. A worse plan is to put a rope around the hind foot on the milking side and try to hold it back, as it sets the cow to jerking and pulling and is apt to injure her. A cow will not kick unless she is frightened, or her udder or teats are sore. To find out the cause of the trouble or rather to look out and prevent the irritation, is the first thing to do.

VAN'S VIEWS.

TOOLS.

IT is quite common to hear a man say that Eastern manufacturers don't know how to make a tool; not that they don't have well-shaped tools—for the Mohawk Valley Clipper is the most popular plow in our market—but they don't seem to have any steel in their shops, or at least, they are afraid of running out of that article. The machine of which I am now thinking, is True's potato-planter, a good machine saving many times its cost during its lifetime; but its plow and covers are great "gluts" of cast-iron, that wouldn't scour in emery-dust; and one must either have cast-iron morals, or else get steel plates made to take the place of these iron gluts. Now, I follow the latter course and get along well thereafter—the machine doing good work. But why couldn't this be done at the factory? A wheelwright, whom I wanted to put in bent felloes when he fixed a wagon-wheel for me, told me he had no bent felloes—they cost so much he didn't keep them. When further pressed, he acknowledged that if he used them he was afraid that he would ruin his custom, as he would have no wheels to repair. Now, poor as is the excuse, those manufacturers have not even this, as their cast-iron will wear as long as steel; and why will they persist in this course?

One of the handiest tools in a garden or on a farm, is a small double-mold-board plow; but they are all cast-iron, and a man whose farm is not located on a gravel-bed or sand-bank, is unable to use one. Inquiry has failed to find a steel plow, of this form, at our home dealers or in Milwaukee.

Another tool that we want, is a horse-cultivator that will work between the rows of fodder-corn. I use Pratt's Early Sweet Corn, and plant the rows two feet apart. My cultivator will work well down to two and a half feet; below that, the single-shovel plow is the only tool that I can use with a horse; and that does unsatisfactory work at the best. Now, I think, we might have an iron-frame cultivator, with long shanks, which would do the work. Does any one know of a tool which will answer my purpose?

There is a one hand-tool to which I can give unqualified praise, and that is the Warren hoe. It was some time before I could coax any of our hardware men to get them, but since they got the first ones they have kept increasing their orders, and the hoe is more and more popular as it becomes known. I have tried to get some of them to order some of Hexamer's prong hoe, but they seem afraid of it, and to order a single one would make it cost something for express charges.

ROOT CROPS.

At a late farmers' meeting, this subject was under discussion, and the president spoke in favor of parsnips and mangel-wurzels. Others favored other roots; some preferring the sugar-beet, the carrot, the ruta-baga, etc. For my part, I prefer the Long Orange carrot, Yellow Globe mangel-wurzel and American Yellow ruta-baga. An old Englishman, who is a better farmer than I claim to be, prefers the Long Red mangel-wurzel, and another good farmer near him, considers nothing equal to Lane's Imperial sugar-beet; while an old gentleman on the other side of the river, considers ruta-bagas away ahead of any other root. Now, here is a variety of opinions; all are conscientious in what they recommend, and the apparent contradiction comes from the difference in their soil. The president is on a sandy loam; I am on a heavy clay; our English friend is on a black, mucky soil; his near neighbor is on a clayey loam; and the gentleman across the river is on a gravelly clay.

FARM HORSES.

There is much discussion among our farmers about which breed of horses, or what sized horses are most suitable for farm work. I am inclined to horses from 1,000 to 1,200 pounds in weight, as being the best size; and I think that a blood stallion bred to a large roomy mare, will give us the most satisfactory stock. Many incline to the Norman horses, and if you want to sell the colts, you will find them as profitable as any; but I would prefer horses with less beef on their legs. I have seen two teams this spring, each having a beefy horse and a trim-built one, and in each case the beefy-legged horse had the scratches badly, while his mate was free from the ailment. That these beefy horses will keep in good order on less feed than a high-strung, active horse, I am quite willing to admit; that they are able to do as much work when well fed, I doubt: and I am certain that, in an emergency, one active horse is worth two of the others. There is almost no limit to what an active, ambitious team can pull for a short distance, and after a rest or "blow" they can do it again and again, while your big, beefy horse is discouraged and has to be urged to make him take the collar after a severe pull. And, anyway, with our farm work, pluck is more needed than weight. I have seen a big team tired out, plowing, when a small, active team had done more work and felt fresh at the end, in plowing a fallow where the ground was soft.

Brown Co., Wis.

HOW CULTIVATION WARMS THE SOIL.

S. RUFUS MASON.

WE are almost daily informed by the agricultural press that cultivation warms the soil. As no man should believe what is not made manifest to his perceptions, let us examine this question, and then form a positive opinion.

The rapidity with which heat or cold passes through a body, is called its conductive power. One end of a bar of iron, inserted in the fire, soon becomes too hot to hold at the other end; a bar of wood may, so treated, burn nearly up to the hand without causing discomfort; and our flesh may be brought quite close to a candle blaze and still be comparatively cool.

These three substances show very different degrees of conductive power, iron acting quickly, wood more slowly, and air (which was between the flesh and the blaze) scarcely acting at all. The conductive power of iron is 347, of wood 33, and of air only the one-half of one. Or, if air is called one, wood is called 66 times as great, and iron 694 times as great as air.

Of these three, iron is the most dense, and air the least; and in fact, the conductive power of most substances is nearly in proportion to their density. When we wish to employ this quality to the best advantage, we use thin clothing in summer and thick in winter. In each case we employ the fabrics as a covering demanded by modesty, and the non-conductive property of air to keep us cool in summer and warm in winter. It makes very little difference as to the material used—cotton, silk or wool—as their respective conductive properties do not vary one-quarter of one per cent. Their sole value, as protectors from heat or cold, lies in the amount of air held in a quiescent state within their texture. Cotton and silk being comparatively close woven, and wool more loose and open.

In regard to soils: a solid, compact, hard or densely packed one holds little or no air, hence is a powerful conductor of both heat and cold; while a light, loose, porous soil holds a large volume of air, and is a poor conductor, is not liable to extremes of heat or cold, retains moisture well, but not water, is warmer in cool seasons, cooler in hot ones, and thus is more congenial to plant growth at all times.

It is evident, then, that to render a cold soil warmer, we must cultivate deeply, to let in the balmy influence of the air; but if the soil is too hot and dry, we must add some heavier constituents, like clay or muck, to temper it to a proper consistency for crop purposes. Deep cultivation makes soil earlier in spring, cooler in summer heats, and warmer during winter's cold, only because it allows the non-conductive atmosphere free access.

Farm Economy.

FARM ACCOUNTS.

PROFESSOR LEVI STOCKBRIDGE.

THE question "Does Farming Pay?" is almost universally answered by farmers in the negative, though they can rarely, if ever, make a detailed exhibit of their debits and credits, which will *prove* either side of the question. Yet it is a self-evident fact that farming pays the nation. It is our great producing industry, the main-spring which keeps all the machinery of transportation, commerce and manufactures in motion, creating a value of untold millions out of materials which have no commercial worth until transformed by labor. If therefore on the one hand, farming does not pay the individuals who pursue it, there must be something wrong in the system by which the wealth created by its labor is divided; or if on the other, it does pay the individual, there must be something wrong in the system by which his business accounts are kept, or he could show by his balance-sheets, his exact business income and expenditure, the amount of his profit or loss. The latter is probably the general fact; or more properly, it is the fact that the farmer has no business system, and does not keep his accounts in such form and with such accuracy as to exhibit the true results of his business operations.

Business enterprises in their income and expenditure are one thing, and the support of a family with all its incidental costs, another and very different one. The farmer usually does not notice this, but assumes that the gross sum of his yearly expenses are farm expenses, though these may be but a moiety of the amount. In his calculations he is prone to error in stating the capital invested in his business, in both its real and personal branches, by treating the entire value of each as a business investment. Just here the farmer should act on the same principle that would be adopted by a manufacturer to determine the amount of his business capital. In it would be included all buildings used for manufacturing, and the land and privileges occupied by the same, the machinery, implements, vehicles and teams employed exclusively in the business, cash and both raw and manufactured stock on hand, and the credit balance between bills receivable and bills payable. But he would exclude from it his dwelling house and everything thereto belonging both real and personal, because they have nothing whatever to do with his business but are an outside expenditure distinctively differing from it.

The farmer should take an annual inventory and it should include all his *farming lands*, and if he owns it, enough wood-land to keep his farm fences and *exclusively farm buildings* in repair, all his buildings erected and used exclusively for the business of the farm, stock of all kinds kept, all teams kept for farm work, all cash crops and manures on hand, and the credit balance between farm bills payable and receivable. From this inventory he should exclude his dwelling-house and all attached buildings and grounds not used for farm purposes, and all implements, vehicles, teams and fixtures provided for the pleasure or comfort of his family, because, as in the case of the manufacturer, they are all an outside expenditure and not essentially connected with his strictly business operations. In the transaction of his affairs he should charge to the farm all labor, including board, whether it be on the farm or attending to its business abroad, or whether performed by persons hired, or by the farmer, his wife, sons, or daughters. But he should be very careful to charge only for service actually rendered.

It is quite common for the farmer to say that himself and family have labored the whole year, when the fact is, some or all the members have spent weeks and even months in other business, attending school, in travel, recreation or amusement; and it would be a manifest injustice to the farm to charge it for time thus occupied. He should charge all seeds, manures and fertilizers used, whether produced on the farm or purchased, all new implements purchased, and for all repairs of exclusively farm buildings, fixtures, tools and vehicles, and also for taxes and interest on all real and personal farm property. Contra: He should give the farm credit for every kind of crop or product sold from it, at the price received, and for all the grain, meat, vegetables, milk, butter, cheese, eggs and other products taken by his family, at their value on the farm, and whether wasted or consumed. This last item is of the utmost importance, and should be as rigidly adhered to by the farmer as by the country merchant who charges to his family all the dry goods, groceries and necessary supplies taken by them from his store. At the expiration of the year, a new inventory should be taken, embracing exactly the same items as the original, and the sum of this inventory and credits balanced with the sum of the debts, and the first inventory will show him his gains or losses for the year. To many, perhaps most, farmers, the keeping of books is irksome and perplexing, and therefore neglected; but it is absolutely necessary if farming is a business pursuit, and is to be conducted by those principles which prevail in other business enterprises.

No person, neither a farmer nor anybody else, can say that his business does or does not pay, unless the exhibit is made by a regular, correct account kept by the above or some similar method, and if thus kept he might, probably would, find that his business was a good one, the trouble with his final bank account being caused by a deficiency of labor debits and excess of family expenditures.

The person engaged in general farming, is really pursuing several distinct kinds of business, each of which requires special operations and has its own income and expenditure. He may be growing or fattening neat stock, raising horses or swine, growing the different kinds of grain, roots or vegetables, producing milk or butter as a market product. Some of these branches may be very profitable, others unprofitable. To ascertain this, separate debit and credit accounts should be kept with each department, so that he may know the source of his profit and losses, and know which department to abandon or improve, and which it may be for his interest to enlarge. It is wise, oftentimes, to keep accounts with the separate fields of the farm, and always an exact detailed record of the expenditures of the farmer's family, including in the latter all it receives from the farm. Complicated and laborious as *all* this may seem, it is no more so than the accounts of intelligent, accurate business men, whom it often saves from failure, and guides to success.

Farming, in every sense, should be managed on strictly business principles, and only when so managed have we any right to expect that it will pay.

Hampshire, Co., Mass.

ABOUT PASTURING LAND.

W. J. FOWLER.

"PASTURED land increases in fertility." The foregoing assertion has so long passed current that it may seem vain to controvert it. Undoubtedly, too, it has some degree of truth; is, in fact, as true a saying as most of the wholesale generalizations which are frequently heard about farming. Comparatively speaking, pasturing probably is more favorable to fertility than growing grain or other products, to be sold from the farm. It exausts the elements of fertility less rapidly. The droppings of animals fed on the land return to the soil something of what has first been taken from it. To this extent pasturing is not exhaustive. And this is all the truth there is in the old saying above quoted. To what extent this return of fertility is made to pastured land, depends entirely on the kind of stock kept, and what is done with them. Mature animals remove less from the soil than those which are growing, and fattening animals less than cows giving milk, or sheep on which wool is always growing. Fat is carbon, and carbon is not a very valuable or important plant-food in the soil. Hence fattening animals or selling butter does not take much of value from the farm in proportion to what is received from their sale.

But other questions are involved. The mechanical condition of the soil is a matter of great importance. Air, rains, dews and the warmth of sunshine, all impart fertility or make it more available. How does pastured land compare with other soil with regard to these agencies? Is it not everywhere true that it is less favorable to fertility? Air and rains will not penetrate the untilled soil. Even the dews, which fall on its herbage, do not touch a particle of soil but are evaporated in early morning. So then we have, as the result of pasturing, that the soil loses less of what is taken from it, and it also gains less from the agencies of nature by which the losses of fertility are restored. To those who know how important these are, the balance seems against rather than in favor of pasturing.

One other point is important. Exhausting the soil is not necessarily a bad result, provided the product will enable its owner to restore its fertility. It is the farmer's business to take from and add to the soil. If he is successful, he is so by selling fertility at a dear rate, and restoring it at a cheaper rate. No men exhaust the soil so rapidly as the market-gardeners of New York city; but every year they add 50 to 100 loads of manure per acre and keep the balance more than even. But let them intermit this manure a single year, and the failure of their crops will indicate the exhaustive system of their cropping. But practically, market-gardening does not injure land, because its profits enable the owners of such lands to manure so heavily. Is this the case with the owners of land in pasture? In grain growing regions there are large and increasing sales of commercial fertilizers. This may prove that those soils are becoming exhausted; but it also proves that their owners make money enough to help to retain the fertility of their lands. Who knows of places where owners of pastured lands are buying fertilizers with which to fertilize them?

In most dairy sections soils are becoming exhausted of their phosphates from sales of milk and cheese. The danger is seen and felt in a decreased production of grass, which only expensive phosphates can restore to its former productiveness. It is time that the old saying, "Pasturing increases fertility" was thoroughly examined, and the serious error which it contains, exposed.

Monroe Co., N. Y.

Miscellaneous

THE TRUTH ABOUT IT.

[UNDER this heading, a number of articles have been prepared by able writers. These will appear from time to time. Their object is not at all to deal with "humbugs"—but with the many unconscious errors that creep into the methods of daily country routine life.—EDS.]

THE IMAGINARY DISEASES OF ANIMALS. No. 1.

D. E. SALMON, D. V. M.

ALTHOUGH the United States is a country of schools and education, and its inhabitants are as intelligent and refined as those of any country, there are many beliefs and practices which have a foot-hold among us, handed down as they have been by tradition from the days of ignorance and cruelty, that are unworthy of our education, a blot upon our intelligence, and a shame to our refinement. And in no direction are these traditions so far from truth, so opposed to the interests of those who believe in them, so barbarous, and I may say, inhuman in their effects, as in the treatment of the diseases or supposed diseases of our animals. Occasionally, or semi-occasionally, a voice is raised in the interests of humanity and truth; but it is hardly heard before it is drowned by the cries of the multitude, who cling to their opinions with a pertinacity worthy of a better cause, and with whom antiquity of inheritance is the most plausible argument. And so, from one extremity of our broad land to the opposite, the first symptom of disease in an animal is a signal for torture of the worst description, to be continued till the disease has run its course, or the sufferer's powers of resistance are exhausted by the so-called remedies; the mouth is burnt to a crisp with red-hot irons, the teeth are knocked out by blows of a great hammer, the eyes are cut and mutilated, the stomach, and often the lungs are poured full of nauseous compounds, sometimes innocent, but oftener deadly in their effects; or, if it should be a cow, a gimlet is forced through the highly sensitive parts of the horns, and to add to the intense pain thus inflicted, salt, pepper, and other irritants are applied; and then the operator, in search of new opportunities to display his skill, seizes upon the tail, and either cuts it off entirely or slits it open for an indefinite length, never forgetting to apply the salt and pepper. All this time these people are as innocent of a knowledge of the real trouble and as unable to determine it, as is the poor animal which is obliged to suffer the consequences.

The great prevalence of these practices, their ridiculous character, their demoralizing influence, and last, though not least, their absolute cruelty lead me to take this opportunity to review them once more in the hope of doing something towards reducing their frequency.

LAMPAS.

This is a term applied to a swelling of the soft parts behind the upper front teeth; it is sometimes a real disease, though one of little consequence, but oftener exists only in the imagination. It is caused in young animals by teething—just as a similar congestion of the gums originates in children; in adult horses, it sometimes occurs with diseases of the stomach and bowels, from sympathy with these organs. It is, therefore, generally seen in such animals as have been poorly fed; in those that have been wintered on coarse, innutritious feed—in such animals the digestive organs are always more or less impaired, and intestinal parasites multiply to a surprising extent. We can therefore understand why frizzly hair, near the root of the tail, is considered a symptom of lampas, since parasites cause an irritation and itching of the rectum, which leads the animal to rub its tail against the sides of the stall or other objects, and this rubbing, in turn, causes a frizzly appearance of the hair. Very often such horses have a capricious appetite, and when put to hard work in spring lose it entirely at times; again, when the spring work comes on, their feed is increased, they eat more than their stomach is accustomed to, and more than it can properly digest, causing disease of this organ and consequent loss of appetite. In all these cases of diminished appetite, the mouth is examined for lampas, and it is not hard for the owner to convince himself of its existence; for, since he has heard of no other cause for the trouble, he decides this must be present. And, then, to cure a supposed tenderness and soreness of the part, he goes to a blacksmith and has a red-hot iron held against the roof of the poor animal's mouth till it is burnt in a terrible manner!

It is scarcely necessary for me to add that in real cases of lampas a slight scarification (not cuts a half inch deep) will prove a relief; but in adult animals, where the trouble arises from digestive disturbance, this must be treated according to its nature. Again, when horses lose their appetite from any serious disease, it is generally decided to be lampas, and so, whether there is inflammation of the lungs or liver, whether there is fever or a carious tooth, the first treatment is apt to be the hot iron.

WOLF TEETH.

These are small, supplemental teeth, called from their position pre-molars; they are very common, but in a majority of cases drop out when the first pair of milk molars are replaced by permanent teeth or soon after; they are, consequently, generally seen in young horses. As horses are quite subject to superficial inflammation of the eyes while teething, from the increased flow of blood to the head at this time, these teeth have become associated with such inflammation and are considered its cause; in the South and West where "big head" is prevalent, these teeth are also often charged with originating the bony enlargements which constitute this disease; as a consequence, horse-owners look upon wolf teeth as they would upon a rattlesnake—as something to be feared and destroyed as soon as possible.

The removal of these teeth causes little pain when properly done with forceps, but when they are punched out by placing a bar of iron against them and hitting this with a heavy hammer, as is usually the case, it not only causes severe and useless pain, but it so frightens the animal as to sometimes make it vicious for life. Wolf teeth have no effect on the eyes directly or indirectly, nor do they cause the enlargements of bones of the nose attributed to them. Dr. Horne, of Janesville, Wis., who formerly believed that these teeth caused blindness, was induced to examine the mouths of a large number of horses, to satisfy himself of their influence. The results of this examination, to say nothing of the almost unanimous opinion of the veterinary profession, founded on many years of experience, should convince any intelligent man. Of 1,073 animals examined, 216 had wolf teeth, and of this 216 all but one were perfectly free from any disease of the eyes or any other part; of the whole number of animals examined, 37 had affections of one or both eyes, but with the single exception mentioned, they did not have wolf teeth. Such an observation, made by one who believed the contrary, cannot be doubtful evidence, and as it confirms what veterinarians have always taught, it should prove conclusive.

HOOKS (HORSES AND CATTLE.)

The belief in "hooks" is not so widespread as that in lampas and wolf teeth, but what it lacks in prevalence it makes up in absurdity. Horses and cattle are, in some sections of the country, kept on such starvation diets during the winter that when spring comes, or before, they are mere walking skeletons; their digestive organs are deranged, their strength exhausted, they are scarcely able to drag themselves along, and this is done with swaying back and staggering gait. How this condition came to be charged to the *membrana nictitans* of the eye, it is impossible to say; but the belief exists that this is the cause, and that it must be cut out to effect a cure. And the belief has extended till now when a horse or ox sprains its back by hard work, a fall, or in any other way, the attention is at once directed to the eyes, and these are mutilated in a most barbarous manner. I have not space to dwell upon this false opinion, but "a word to the wise is sufficient," and a little reflection must convince any one of the ridiculousness of attempting to remedy a condition of starvation or a sprained back by any amount of ocular surgery. The diseases of animals are not so different from those of men, but that it is safe to ask one's-self what he would think if a physician proposed to institute such a treatment for a similar disease in people.

SELECTION OF VARIETIES OF FRUITS TO BE PLANTED.

T. T. LYON.

SOUTH HAVEN, MICH., May 22, 1873.

IT is by no means safe to conclude, because a variety of fruit is found successful and desirable in a given soil or locality, that it can therefore be relied on to succeed in other and untried situations.

The planters of fruits have shown themselves very slow to acquire, and slower still to act upon the knowledge of this fact. Many of my readers will, doubtless, be able to recall the fact that the earliest National assemblages of fruit-growers occurred in the autumn of the year 1848, and during the next few months thereafter; and that, at such conventions, committees were appointed, charged with the duty of framing lists of fruits to be recommended for general cultivation; but, to the great surprise of all, it was soon discovered that no varieties can be said to be more than locally successful; although an occasional one, such as the Bartlett and Seckel

among pears; the Concord among grapes; and the Wilson among strawberries, seems gifted with ability to attain success over a wider region than most others; while yet others, like Newtown Pippin, Swaar, and Esopus Spitzenberg, can hardly be said to prove fully successful away from their native localities.

There possibly is occasion to doubt as to the extent to which the fact of such failure is attributable to climate, and how far it may be due to aspect, soil or other contingency. Nevertheless, the fact remains; and it behooves the planter to consider it well, before proceeding to select his varieties. Indeed, the success or failure of varieties seems so little amenable to mere climate, and is apparently so far independent of the limitations of parallels of latitude, that in no case can it be considered safe to assume the success of a variety in an untried locality; nor yet to treat apparent success as certain and permanent, until the trial shall have extended over a series of years, and upon a variety of soils.

I am convinced that, to the careful observer, there can be little doubt that, if the selection of varieties for the present orchards and gardens of the country could have been wisely made, the mere fact of such wise selection, under all the existing drawbacks of neglect and bad management, or, in too many cases, no management at all, would have had the effect of doubling the money value of their products, taken as a whole.

BENEFITS OF THE GRANGE.

Allow me to thank you most sincerely for the good words and kindly regards for the Grange, expressed in your leader of Jan. 26. I had been thinking while perusing Prof. Roberts' articles in relation to Agricultural Colleges, that while the few are privileged to enjoy the advantages of scientific training, which are afforded by these institutions, the great mass of agriculturists remain unbenefited except it may be by reflex from those thus privileged. But the Grange as an educator reaches, or may reach, every farmer's home in the land. Its social, and educational influences are felt in the remotest hamlets and particularly in the "Great West."

"A word fitly spoken, is like apples of gold in pictures of silver," and the dictum which goes forth from such an influential, and widely circulated journal as the Rural, may decide hundreds, and perhaps thousands to take a step which I am certain they will never have cause to regret.

That the Grange is the greatest secular power for good, that has ever been brought to bear upon the agricultural population, no one who is acquainted with its workings will deny. Too many farmers and their wives live in selfish isolation, with their backs bent, and their heads down, always digging with the mud rake, like the man in Bunyan's Pilgrim's Progress, never taking time or caring to look up. Some there are who joined the Grange solely for financial benefit. In this they need not be disappointed, for by judicious massing of orders, and prompt payment of cash, many dollars may be saved. In the purchase of agricultural implements, musical instruments, sewing machines, fertilizers, grass seed, &c., many thousands of dollars are saved to the patrons every year. We have a little supply room in our Hall where most kinds of groceries are kept. They are purchased at wholesale, done up in convenient packages by the seller, the weight marked on each package, and the patron pays only the wholesale price, thus saving from 20 to 50 per cent. There are more kinds of groceries than the uninitiated are aware of, for which we would have to pay on the street twice the wholesale price for which we can get them through the Grange. But while the financial part contributes cohesive power, and is a necessary component of success, there is a leaven which is more subtle and sure, more necessary to the vitality and longevity of the order, and which leavens the whole lump. It is the educating power, socially and intellectually and this feature of it the members are learning to prize beyond all financial gain derivable from it.

To come to particularities—for I notice they often secure the attention better than generalities—the Grange of which I have the honor of being a charter member, has been in existence something over three years, and has a membership of over 100, composed mostly of farmers and their wives, all first-class people, for we have tried to be very careful not to admit any but worthy members, and to reject those whom we should be ashamed to call brother or sister. The Grange meets Monday afternoons, for Monday being butter day in town makes it more convenient for the men. At first the ladies demurred at this arrangement because it so materially interfered with the washing, but somehow they seem to have compromised the matter, for the potent power of the Grange has either prompted them to unusual activity in the early morning, or to defer the washing till another day. To woman particularly does this institution come as a benediction.

The greater part of the life of the average farmer's wife is toil, and drudgery, with little time for rest, or thought, mental improvement, or the refinements of social life. But the Grange gives her stated periods of rest and recreation, affords her something new, and pleasant to think about, and lifts half the burden. The pleasant friction of social contact with others, renders her cheerful, and enables her to look upon the pleasant side of life. In no other organized body is woman placed upon an entire equality with her husband, empowered to hold the same offices, and cast her vote with the same unrestrained freedom. This feature alone should recommend the Grange to every intelligent lady in the land.

The mental powers of the members are stimulated by discussion of agricultural topics and such other subjects as have been found of interest, and many an essay has been written and read by those who, when first called upon, thought it beyond their power to do such a thing, but who found, when it was tried in real earnest, that it was not so very hard after all. Some object to the Grange on account of its secret character. Do not all organized church societies, business firms, and even the family, have secrets which they do not care to have every one possess? The Grange is not an oath-bound society, its secrecy is enforced simply under an obligation which will not conflict in the least with one's moral or religious convictions, but which a man or woman of honor will consider as binding as an oath. It has secrets enough to hold it together, and to prevent any but the initiated from gaining entrance. The machinery works admirably and without friction—Subordinate, County, State and United States Grange, like wheels within a wheel, or links of one unbroken chain.

The different County Granges are doing an excellent work in the organization of Mutual Life Insurance Companies. It is to the shame of farmers that they have paid hundreds of thousands of dollars to Insurance Companies to support the officers in extravagance, build marble palaces, and buy whiskey and cigars for agents who ride about the country; without having realized in the aggregate the one-hundredth part of their investments. It is notorious that if he has the misfortune to have his buildings burned, the adjuster will throw out of account everything possible, and pay as little as he can of the loss incurred. This County has, within a short time, formed a Patrons' Fire Relief Association, starting out with $110,000 risks which I trust will soon be increased to five or ten times the amount. The rates, instead of being ¾ of 1 per cent for three years, as in the stock companies, is from 1-7 to 1-10 of 1 per cent for five years, according to proximity and character of buildings. Then we have the Patrons' Aid Society organized on the same basis as the Masonic Relief, which obligates the member to pay one dollar on the death of any other member. This—with the entrance fee which is small, and graded according to the age of the person—constitutes all the expense. There are no salaried officers to pay, except the actual expenses of the Secretary, and the beneficiaries get the whole sum paid by the members. Mrs. W. C. G.

Suffolk Co., N. Y.

PUBLICATIONS RECEIVED.

The American Antiquarian. This is the first number of a new quarterly periodical devoted to early American history, Ethnology and Archæology, edited by the Rev. Stephen D. Peet, and published at Ashtabula Ohio. It contains, exclusive of advertisements, sixty pages, nine of which are occupied by illustrations of Indian antiquities discovered in various parts of the country, and described in the text. It fills a desideratum in American literature, and while of special interest to archæologists, also affords entertainment and instruction to the general reader.

Arguments before the Committee on Patents of the House of Representative in February and March 1878, with reference to amending the laws relating to patents. This is a subject which affords a large scope for discussion, and the opinions of a dozen or so experts on the matter are condensed in the 375 pages of this work.

CATALOGUES, &c., RECEIVED.

Crop Prospects for the month of May, from special correspondents. L. L. Polk, Commissioner, Raleigh, N. C. 76 pages.

Nineteenth Annual Report of the Superintendent of the Insurance Department, State of New York. Part Second. John F. Smyth, Supt.

Hooker Nurseries, Rochester, N. Y. Specialties: the Brighton and Lady Grapes, Roses, Magnolias, Gooseberries, Currants, Peaches.

The number of students attending the Illinois Industrial University (Urbana, Champaign Co., Ills.,) in 1877-78 was 377.

Circular. American Association for the Advancement of Science. Twenty-seventh meeting to be held at St. Louis, Mo., August, 1878.

List of Premiums of the Iowa State Ag. Society for the Twenty-Fifth Annual Exhibition, to be held on Sept. 16-20, at Cedar Rapids. 75 pages.

Arboricultural.

LARCHES—CONCLUDED.

European Larches occupy a very important office in the plantations of Europe intended for either timber, for ornament or for shelter. Few trees grow more rapidly, or are finer during their early spring growth. Later in the summer, in America at least, a dimmer and more rusty hue is apt to pervade the foliage, which renders it less attractive. In Europe, however, their peculiar office seems to be that of shelter as well as timber. Massed together as wind-breaks on the outer boundaries of estates or smaller lawns, their rapid growth, thick foliage and cheapness well fit them to set off and protect the beauties of more tender and choice trees. Their employment for such purposes in America has not proved indeed equally successful. There is something about their nature that unfits them for thriving in our summer climate. The rusty hue indicates this and a sparse slender growth soon demonstrates it to a certainty. Then, again, they do not prove with us very easy to transplant, especially in the spring, when their habit of starting early causes many failures in cases where too much delay has occurred. The fall, in this latitude and further south, is undoubtedly the best season for moving all Larches, and were it always selected, far less complaint would be made concerning the difficulty of transplanting them. After acknowledging all the good qualities of the European Larch, we hardly think it will ever attain, much less hold, the important position among our trees intended for massing, that the Norway Spruce, White Spruce, and Austrian and Scotch Pines occupy.

We should like to say a word here concerning the importance of these masses planted especially for wind-breaks while at the same time they give a distinctive character to the place and afford a frame-work to its general arboreal surroundings in the shortest time and best manner possible. It should be the first duty of the landscape gardener to establish the protective adornments to which class undoubtedly the Larches belong and for which they possess a decided value.

The peculiar form of Larch represented so truthfully on the first page of the last number, is a variety of the European or rather of a particular form of that species, known as the Tyrolese Larch. It is said to have been picked out of a seed-bed in Mr. Godsall's nursery many years ago. The grotesque and remarkable form it assumes is very persistent. Indeed, the specimen in question bids fair to soon become a perfect monstrosity that must have, in order to prevent it from breaking down of its own weight, artificial supports under several prominent branches. The weight of snow in winter presents yet another danger for its abnormal formation. Unlike the stems of most high-grafted trees, the trunk of this form of Weeping Larch seldom incurs disease but it will be readily seen that the above noted monstrous shapes prove even in this case the fundamental weakness of the system of high grafting. Undoubtedly, however, the strong desire of most people for immediate effect will long secure the employment for high-grafted Weeping Larches, especially if by systematic pruning the weeping tendency be regularly trained to assume graceful shapes free from the distortion so sure to ensue if the tree is left to itself. The low-grafted form is therefore, in this case as well as others, much the best. It is a natural growth from the ground up, a weeping pyramid, and a proper feature of the landscape in its ordinary stages of development, and this the high-grafted is not. The specimen in question was imported from Europe years ago, and has apparently received no treatment with the knife during its occupation of the present position.

Larix glauca or alba is a variety of the Europæa Larch, that shows very light foliage on its young growth, otherwise it is not very distinct.

There are many Larches other than these two species: indeed their own varieties are numerous; but, practically, for ornamental effect, there are only two others that are worth dwelling upon. Larix Dahurica is a small tree of peculiar hardiness, "dwarfing down by climate to a stunted bush, with twisted, half-pendulous branches." It is found far north in Siberia, on the bleak mountains of Dahuria, in regions where appear only the last vestiges of arborescent vegetation. The distinct forms and rugged nature of this Larch give it a decided value; for it is well known that some species of Larch, such as Griffithii, etc., are not really hardy in this climate.

One of the most notable of all Larches is the leptolepsis, *par excellence* the Japan Larch. It is a more slender and delicately formed tree than Enropœa and belongs to a more refined type. "It is cultivated" says Gordon, "by the Japanese in pots which, in some instances, are priceless; hence, its Japanese name, Kin-t'siansoung, Money Pine." The high mountains of Japan dwarf it to a mere shrub of two feet.

Whatever may be said, in a general way, against the Larch as a specimen tree in America, nothing can surpass the soft, rich green of its foliage in spring: with regard to trees massed in groups for shelter and effect, most of these objections disappear.

THE GOLDEN RETINOSPORA AS A HARDY EVERGREEN

I should like to render my testimony in favor of this beautiful little golden evergreen on one special account, namely, that of hardiness. It is a well known fact among all who have attempted to grow evergreens on the bleaker points of the New England shores, such as the cliffs at Newport etc, that generally they are not capable of resisting the effect of severe ocean winds laden with salt spray. The Norway Spruce is soon rendered thin and meager and the Hemlock utterly destroyed. Arbor Vitæ, Junipers of certain varities, and Yews shrivel up and die, and even Scotch and Austrian Pines, in most cases perfectly rugged, will in peculiar localities lose the lower limbs, and become naked and bare. These last-named evergreens may, however, be termed fairly hardy, and classed in this respect with the White Spruce, Creeping Juniper etc. Indeed, so few evergreens thrive in full exposure to the vicissitudes of such situations, that the use of deciduous shrubbery and trees is to be specially commended for the main and most exposed plantations of these localities.

Strange to say, however, a conifer that has been occasionally, with seeming injustice, called tender, exhibits in the worst exposures, a vigor and endurance that are really astonishing. The Golden Retinospora, the conifer I mean, has something in its nature that adapts it to more situations, more pruning, more transplanting than almost any evergreen that can be named. I do not propose to dwell on the other notable virtues of this Retinospora, but simply to point out this particular quality, tested now for years, that must always entitle it to a high place on the list of the landscape gardener's material. Samuel Parsons.

Veterinary.

IS THIS A NEW HORSE DISEASE?

For about one year this section of the country has been afflicted by an unknown disease among horses, and many valuable animals have sickened and died from it, while of all that have been affected, I know of none that has recovered. The proprietor of a hotel in this town has just lost twelve horses, young and old, in this way, and others in the neighborhood have likewise been heavy sufferers. The most skillful local horse-doctors that have been called to treat this strange malady, have so far been unable to effect a single cure.

The symptoms and course of the disease, so far as I can learn, are as follows: At the outset the horse shows considerable weakness, accompanied with quick pulsations; the circulation then becomes sluggish, especially close to the surface, though it is believed to be more than normally rapid about the heart. Death, though certain, is not immediate. The horse will linger for weeks and months, from three to six months being, indeed, the time within which the animals are carried off after the attack commences. Meantime the appetite continues good up to the last, and feeding the animals well seems to have a better effect than turning them to grass; for with the latter treatment they die off rapidly. From the first, however, the horse loses flesh and runs down generally.

Should any reader of the Rural happen to know the cause, nature, course or cure of this malady he would confer a great benefit on hundreds hereabouts, and perhaps elsewhere, by telling what he knows with regard to it through the columns of the Rural. T.

La Rue, Marion Co., O.

Field Crops.

THE HESSIAN FLY'S FAVORITE WHEAT.

As was apprehended last fall, the *Cecidomyia destructor*, or Hessian Fly, is ravaging the wheat crop in this section to a fearful extent.

The Clawson and all white wheats are the varieties infested. Red wheats, and especially the Lancaster, seem to be proof against the larva of the fly. Either the fly never lays eggs on the blades of the Lancaster or else the larva after coming from the egg fails to wedge itself between the leaf and the culm, in the axil, which is claimed to grow closer and to be of harder texture. A number of pieces of wheat are now growing in this vicinity, which were sown in part to Clawson and in part to Lancaster, and at the very boundary between the two varieties of wheat, the Clawson is "crikling" down and some stems contain as many as twenty larvæ, some of which had changed to pupæ as early as May 10th. Of course all the larvæ came from eggs laid this spring. The Lancaster, only a drill-mark away, is vigorous and entirely free of the maggot.

A still more remarkable case of white and red wheat growing side by side, is a piece of wheat owned by Mr. A. Barton. When he began sowing a field to Lancaster, there was about a half-bushel of Clawson in the drill, which was not taken out, but the Lancaster was put in the drill on top of the Clawson. Now, at this time, the very place and distance to which the white wheat reached can be readily seen and marked, by the unhealthy condition due to the presence of the fly larvæ. These cannot be found elsewhere in the lot.

The cause of such a phenomenon is certainly worthy of the attention of entomologists. While the fly, in its younger stages, is found on barley and rye as well as on white wheat, red wheat is without a specimen of the larvæ. Notwithstanding the improbable difference between the white and red wheat plant, it seems very proper to call the insect the White Wheat Fly. Rank, rich pieces of wheat are looking well in spite of the

pest. Still pieces of wheat which, two or three weeks ago, gave promise of yielding 20 bushels per acre, are now, in consequence of cold weather, frosts and, above all, the insect, looking so bad that five bushels per acre would be a proper estimate. Arnold's Gold Medal wheat falls a prey to the fly, but the White Egyptian seems to be unattacked.

W. L. DEVEREAUX.

Wayne Co., N. Y., May 20.

RYE AND OATS FOR WINTER PASTURE.

THAT portion of the field sown, last fall, with rye for winter pasture, failed to realize my anticipations, owing to a combination of causes. Had it been sown in August instead of September, and had two bushels per acre instead of one been used, it would have furnished more than double the amount of feed. As it was, I turned off the stock on April first, and by May the first it was heading. Though very thin I hoped to save some seed, but it soon began to die, here and there a stalk, until nearly one half was dead. On May 29, when just ont of bloom, it was cut. I have some very nice straw for tying corn-fodder &c. That portion of the field sown with winter oats, though sowed some two weeks later, proved much more satisfactory, stooling out well, and giving more pasturage. The oats were ripe by May 28th, yielding a fair crop of good heavy grain. I shall try both the rye and oats again next fall. M. B. PRINCE.

Warren Co., N. C.

Industrial Implements.

THE IMPROVED "SWEEPSTAKES."

MOST of our readers are not unacquainted with the many points of excellence of the "Old Reliable Sweepstakes" thresher, made during the last twenty-six years by C. AULTMAN & Co., Canton, Ohio.

The illustration given of the thresher in this number does not show a recent improvement to which we wish to call attention. The motion of the riddle has been changed from "side-shake" to end-shake, and the twelve hundred machines being made for the season of '78, will be fitted with this improvement. Anyone conversant with threshing machines will understand the value of this improvement. The motion of the end-shake is in the direction of the line of the machine, which causes the thresher to run steadily without props or screwing up wheels. Giving an endwise rocking motion to the riddles, and grain, wet or dry, is bound to move forward and off, making "choking" out of the question.

This motion is not communicated from the shaft, but is secured by an ingenious device that relieves the shaft, and makes its motion easy and unstrained. The grain falls on the riddles in two places, securing an equal distribution, which greatly increases their cleaning capacity. The fan mill blast can be changed at will, owing to recent modifications, and the blast is evenly distributed, be the machine large or small. This point is best appreciated when working different kinds of grain and seed. It is said that in flax and timothy the "Sweepstakes" is especially efficient.

This thresher is too well known to need reference to the thorough manner of its workmanship and the excellence of material.

The popular CAREY power, made by this Co., has undergone a few minor alterations, that while not affecting the principle, are of great importance as conveniences. The bridge, for instance, is now made in three sections, connected by bolts operating in slotted holes. If damage occurs, this construction puts it in the power of the operator to readjust the machine easily and quickly. Instead of wedging the bearings against the shafts operating the bevel wheel and pinion, a set screw acting as a pivot, is forced against the boxes. As the boxes wear on the shaft they may be adjusted with the screw, and always have an even pressure and surface along their length. If well lubricated, then the friction will be slight, and the motion easy and uniform. Badly adjusted bearings are the cause of cutting out shafts, hot boxes, and immense friction. This device seems to us to be admirable.

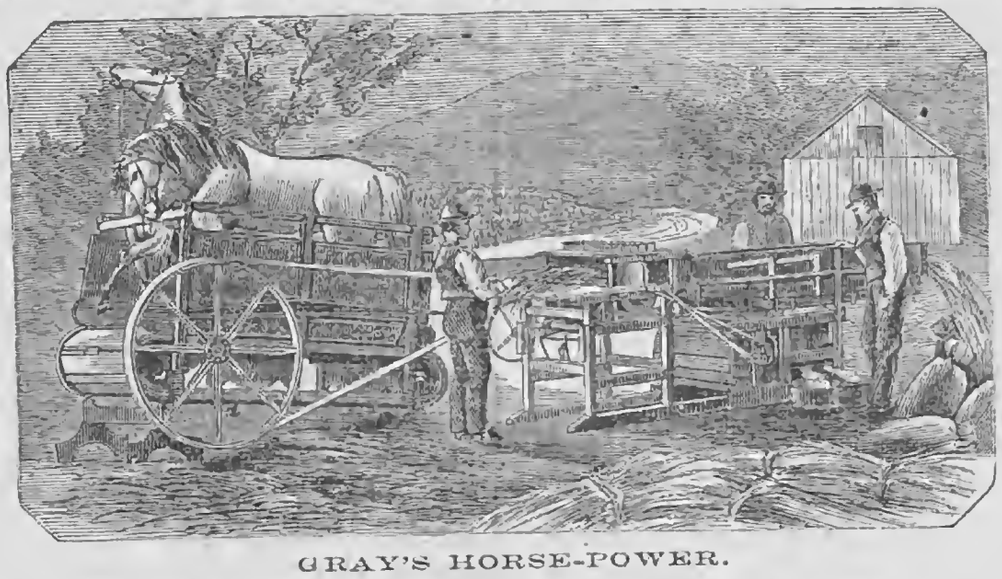
When steam is preferred for threshing, the firm has made an engine, the "Canton Monitor" as it is called, that answers well the purpose for which it is designed. It has a vertical boiler, hung low on wheels fitted with rubber springs. The precautions against explosion are ample, including a safety plug that melts out at a certain heat and lets the steam into the fire-box.

It is easily set for work, needing no leveling, and by turning the forward at right angles to the rear wheels, the engine is sufficiently braced. It is economical in the use of water, fuel and time, and is very durable. None but the best material is used throughout, and the aim to secure lightness, strength, full work and cheapness has, it would appear, been attained.

The explanatory circulars, furnished by Messrs. C. AULTMAN & Co., give information as to details, etc. They are supplied gratuitously.

GRAY'S HORSE-POWERS.

THE just appreciation in which horse-powers are held by the farming community is indicated



GRAY'S HORSE-POWER.

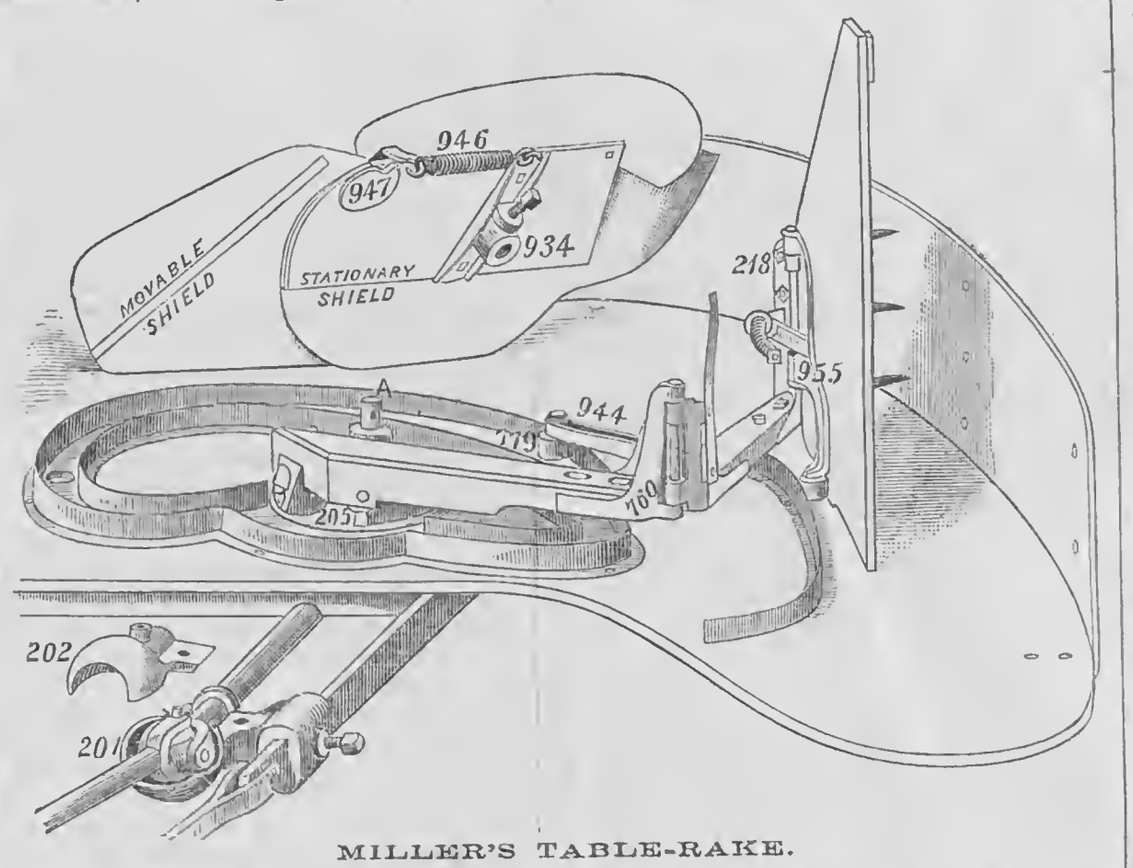
by the capital employed in their production, and a good test of success, which means, of course, thoroughly trustworthy and satisfactory machines, is the ability of a maker to hold and increase his business. The Messrs. A. W. GRAY'S SONS, of Middletown Springs, Vt., are a conspicuous example in this respect. The business begun by their father, years ago, has been steadily augmented, until to-day theirs is one of the representative firms in this branch of agricultural machinery.

Their powers are adapted to one, two and three horses, and the range of work conforms to this proportion. The horse walks on an endless platform, the pieces composing which are fastened on the under side by wrought-iron gear, connected by polished cast-steel rods of the most superior quality. These rods serve also as axles for the rollers, and move with the platform over a cast and wrought-iron track. The wrought gear meshes with pinions on the main shaft, to which is attached the band-wheel. The two and three horse-powers are modified by center tracks under the lags, on which run a set of middle rollers. These rollers hold up the lags and prevent springing, at the same time relieving the end rollers of a part of the weight. The light weight of these powers—being 850, 1,450 and 2,000 lbs., respectively, for the one, two and three horse—is an important feature, rendering them highly portable, and of necessity easily handled. Their construction reduces friction perceptibly, making less work for the horse to accomplish a unit of work.

In addition to general applicability to such work as running machinery for shops, grinding apples, churning, pumping water, cutting feed and working grist-mills, this firm apply them to their specialties, which may be said to have been invented because of the existence of the horse-power, as far as they are concerned.

Claiming attention at the head of the list stand the threshers and separaters, compact, durable and effective machines, that have recently been improved to a degree approaching perfection. They are well adapted to the wants of small farmers, and do most satisfactory work. One hundred bushels of well-cleaned oats per hour is not an extraordinary amount.

Drag saws and machinery for sawing logs, circular saws and minor manufactures, all of the best material and workmanship, added to as low prices as articles of the first quality can be sold, account for the extensive sales of this firm. Descriptive circulars, giving details of prices, and lucid descriptions of various machines and powers, may be had on application to the firm.



MILLER'S TABLE-RAKE.

MILLER'S TABLE-RAKE.

WE assume that the reel-rake is known to all men who have to do with harvesting machinery. The table-rake is designed to perform the same work as the reel-rake, but the methods employed are entirely dissimilar.

MILLER'S Table-Rake, of which we give an explanatory drawing, is the invention of Mr. MILLER, of the firm of AULTMAN, MILLER & Co., Akron, Ohio,—the gentleman who invented the widely-known Buckeye mower.

As its name indicates, the rake is attached to the platform or table of the new machine. It is driven by shaftings with universal joint and bevel gearing; its sweep or orbit is determined by a cam on the center of the platform. In operation a roller (779) following the contour of the cam, works the jointed arm (760-955) by extending or shortening it to suit the curves of the table. The fork, as seen at the end of the arm, starts into the grain close to the "shoe" and sweeps across the table in a line parallel to the sickle; on its journey it gathers and compresses the grain against the outside board of the platform, and delivers it in a neat, compact gavel, quite out of the way of the machine on its next round. This is the whole operation. To deliver the grain upon the table a light reel, adjustable to hight from the driver's seat without stopping the machine, is used. It is driven by chain-gear, connected with the main shaft of the machine, and is, of course, independent of the table-rake. The mechanism of the rake is covered by a shield, that is seen in the illustration resting against the circle-board. The movable shield makes way for the rake as it swings around to the front.

The advantages said to result from this application of the rake, are that the gavels are delivered in much better shape to the binders, and that no matter what the condition of the harvest, once the grain is put on the table the rake delivers it uniformly; the rake itself requiring no adjustment for different conditions of the crop. The reel-arms work parallel to the cutter-bar always, with a uniform motion throughout, just as when applied to a "dropper." The rake works automatically, delivering a bundle every thirteen feet, unless the driver objects, when by a foot lever he can control it completely, stopping it at any point in its course. This is a great convenience, as may be appreciated by those who have had experience in thin grain, and at the corners of fields, as the bundles may be carried as far as desired before dropping.

The other parts of the machine which contribute to the successful working of the rake are too well understood for comment. The platform is attached to the main frame, front and rear, evenly balancing the weight on the wheels.

Mr. JNO. COLEMAN, English Commissioner to the Centennial, speaking of the work done by this rake at the Centennial Field Trials, at Schenck's Station, says: "The men employed in binding the sheaves were unanimous in their opinion that the sheaves made by the table-rake were remarkably easy to bind," and he adds, "The draft appeared moderate, and the machine was very steady in work."

This agrees with our own observations made at the time, under the circumstances mentioned.

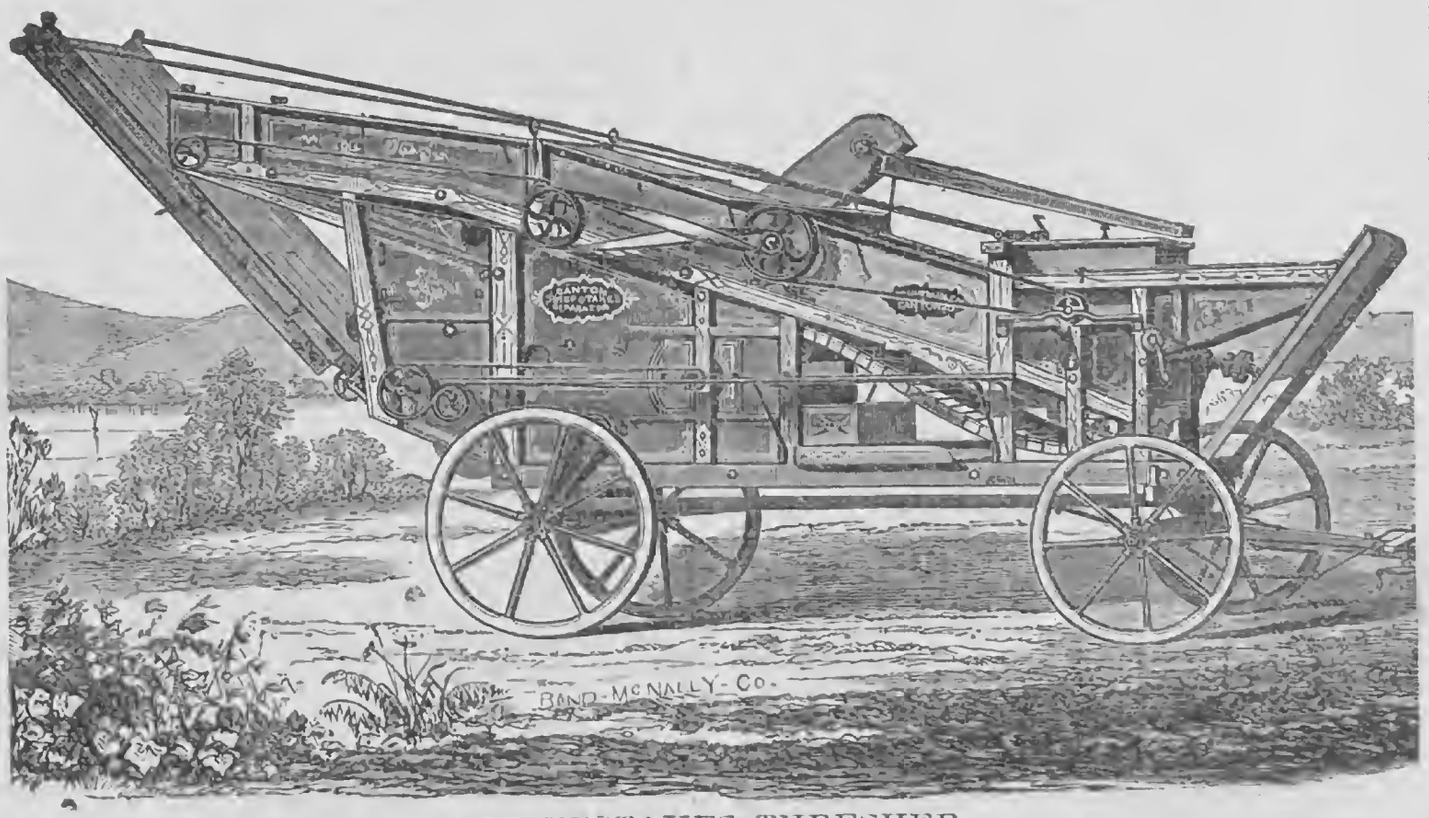
It would be impossible in the space of this brief notice to call attention to several improvements made by this firm this season, notably the "new" model Buckeye mower. The self-binding harvester is reported to be doing very satisfactory work. Circulars fully descriptive of these machines will be sent free on application.

THE LIVINGSTON KNIFE-GRINDER.

THE Knife Grinder, recently advertised in our columns, made by Messrs. LIVINGSTON & Co., Pittsburgh, Pa., has been in use during the past week on our Experimental Farm. It gives us pleasure to be able to corroborate, by actual test, the good points claimed for it by the makers. Its portability is one of its most convenient features. It works easily, sharpens rapidly, and the emery wheel does not draw the temper of the knives, as we feared it would. Its convenience and low price should commend it to every farmer. We cordially recommend it.

"PHILADELPHIA" LAWN MOWER.

MESSRS. GRAHAM EMLEN & PASSMORE the manufacturers of the widely known "Philadelphia" lawn mower have had an exceptionally prosperous season. At the present time the firm is four hundred machines behind its orders, a very flattering showing, and conclusive evidence that whatever other things people neglect, the lawn is being industriously mown.



SWEEPSTAKES THRESHER.

The Querist.

ANSWERS TO CORRESPONDENTS.

Experiments with Commercial Fertilizers, also with Seed Potatoes.

Having read accounts of the results of using ground bone and other fertilizers, given by farmers who had extensively employed them in different sections of the country and who recommended them as paying investments, and having been myself short of manure, I was induced last year to make a small investment in these much landed fertilizers. I purchased half a ton each of bone and phosphate from two extensive firms and in using them followed the directions laid down in the accompanying pamphlets, in every respect.

I tried my purchases on potatoes and, on measuring the crops, found there was no difference in the yield of land thus fertilized and of that on which neither ground bone nor phosphate had been applied. I tried them on meadow land, corn and oats without any benefit whatever. Indeed the oats were not so good as on unfertilized land. I used them in my garden and thoroughly mixed them with the soil, but found their effects injurious rather than beneficial. Before purchasing any fertilizer extensively, I would recommend farmers to experiment with it on a small scale. A number of years since, I had the same experience in using MAPES' improved superphosphate, which with me proved to be a complete failure.

There is another experiment of mine which I will state for the benefit of those who have not tried it. Some time since, in the Scientific Farmer of Boston, a man who had followed the practice every year, recommended that seed potatoes should be bought from Vermont or some other northern State, and according to him, it would greatly improve the crop and enlarge the yield. I had long been of the same opinion and concluded to try it. I purchased from Vermont potatoes enough to plant four acres; cut them into pieces of from two to three eyes each and planted them. As it was an experiment I wished to know precisely the relative results. Accordingly I took some of my own and cut them in the same way. Soon I could readily perceive the difference in appearance between the two kinds, and this was kept up until the crops were ripe. Then I dug and measured them, and having made a calculation, found that if I had used my own seed altogether, I should have had 100 bushels more of good, sorted potatoes.

Now, the subject that interests farmers most at the present day is how to best maintain or restore the fertility of the land. I am fully satisfied it will not pay to buy commercial fertilizers, but it will pay to economize farm-yard manure and to make all we can of it.

Can any of the RURAL readers give a statement of the effects of plowing under green crops, such as clover, corn, rye, millet, peas, etc.? Any information on this subject would oblige and benefit many others in this section as well as this special

READER OF THE RURAL.

Wayne Co., N. Y.

ANS.—Our friend's experiments did not go far enough. He purchased "bone and phosphate." Bone is phosphoric acid and lime. Dissolved in sulphuric acid, it is "superphosphate." If the article was of good quality and his land needed phosphoric acid, it would certainly have produced an increased yield. His advice to farmers to experiment on a small scale before purchasing largely of commercial fertilizers is excellent. That is what we have been advising again and again during the past six months. If upon separate plots he had tried dissolved bone-black, muriate of potash, nitrate of soda etc. and various combinations of them, he could have gained *some* indication of what manurial ingredient his land needs.

2. Thousands of such experiments are being tried every year. It is not an experiment, since the results are well known. Many are of the opinion that the fertility of a soil can be maintained by turning under clover alone.

Treatment of Palms—Growing them from Seed.

Amateur, New York City, asks which is the best way to keep Palms healthy and also how to grow them from seed.

ANS.—Use a compost of fibrous, lumpy loam mixed with clean, sharp sand and some leaf-mold, smallish pots, and good drainage. Never over-pot, and in shifting, don't remove much of the old soil; pack the fresh earth firmly. In the case of strong plants, add manure to the soil, but for small plants, the stimulants had better be in liquid form. Keep moist at all seasons, but most so in spring and summer. Syringe overhead on fine afternoons and sponge the leaves occasionally. Yellow and freckled leaves are the result of a sodden soil: then repot, removing some of the old soil and drain thoroughly. Before putting outside in summer, harden off well, else the leaves will get browned and destroyed. Palms love heat, moisture, a little shade, and while growing revel in bottom heat; but many grow well in cool greenhouses, in dwelling house windows, and some, as the Chinese Chamærops, may be wintered in the cellar and stood outside in the summer time.

Fresh seeds germinate very soon, old seed often take months. Grow in a temperature of 50° to 90°, according to kind. Plant the seeds in a shallow box filled with sandy earth or in small pots plunged in a box of sand; cover over with some sphagnum, cocoa-nut fiber or rough leaf-mold to prevent hasty evaporation. Keep the earth slightly moist; much wet will rot the seeds. Place the seed-box almost anywhere till germination appears, then bring it to the full light.

Cost of a Nice Green-House.

A Devoted Reader, Norristown, Pa., has been waiting a long time to see in the RURAL a nice plan of a small green-house, and inquires what would be the cost of one, for building which he has a space nine by eleven feet.

ANS.—"A nice plan of a small green-house" is too indefinite: "nine by eleven feet" doesn't give much information. If what is wanted is a detached building of that size, it will cost much more than if it adjoins a dwelling on one side, and that plan will again exceed in cost the construction of one in an angle of the house. The first involves four sides; the second, three sides, and the last but two. The floor and roof will be about the same in either case. The first will cost about $85, the second $65, and the third $50. The heating will depend on the exposure and which of the three forms of construction is followed. A small stove is probably, in this case, the best and cheapest. A description of the manner of making a cheap green-house was given by MRS. ANNIE L. JACK in the RURAL for May 11th.

Locusts and Barberries.

Mrs. M. A. Ross, Walla Walla Co., Washington Ter., asks, 1. whether she can subscribe now for next year's RURAL and have the subscription counted towards a cricket, her present subscription expiring next fall. She also says: "Last year I planted Box Elder trees as I would peas. They grew very fast and by fall were much larger than some locust trees which were planted at the same time. Locust seed should be soaked for a day or two in tepid water before planting." This spring she procured Honey-Locust and Barberry seeds for hedges, soaked the seeds in warm water and inquires, 2. how long it will be before the hedge will do for a fence. 3. Having heard that the fruit of the Barberry is nice for preserves and jelly, she wishes to learn when the bushes will bear fruit.

ANS.—1. Certainly. 2. That depends upon care, situation and manner of planting. We should say five years for the Locust—six years for the Barberry. 3. From seeds different plants will vary greatly in their time of fruiting. We should say they would average four years.

Saving Irish Potatoes.

F. M. Billing, Montgomery Co., Ala., asks to be told the best way of saving Irish potatoes.

ANS.—In the Northern States they are easily kept by burying them in the ground deep enough to keep out the frost, or they are kept in cellars. They should be dry when put up and never allowed to freeze. They must not be kept very warm; keep them dry and cool. For the section of country in the latitude of Alabama the following will probably be especially applicable. In spring, or on the approach of warm weather, potatoes in the north are taken from the ground or the cellar and spread in layers not over a foot deep, in a dry place—in a barn or under a shed. They wilt a little when so kept, but this is far better than to keep them in a damp or warm place as in a cellar where they will soon exhaust themselves by sprouting.

Grass Seeds for Name.

W. A. Whittemore, Chautauqua County, N. Y., says that, last September, a piece of land he had sown with winter wheat was seeded by him to Orchard grass as he supposed. Now, however, he sends samples of three different kinds of seeds gathered from the catch, and asks the botanical as well as the common name of each sort.

ANS.—No. 1. Dactylis glomerata—Orchard grass. No. 2. Holcus lanatus—Velvet-Grass or Meadow-Soft-Grass. No. 3. Lolium perenne—Darnel, Rye-Grass or Ray-Grass.

Black-Leg in Cattle.

O. E. French, Wright Co., Iowa, asks whether there is any cure for "Black-leg" in cattle.

ANS.—A pretty exhaustive article, from the pen of D. E. Salmon, D.V.M., on Malignant Anthrax, a disease of which black-leg is a common form, was published in the RURAL as lately as May 11th; and two weeks earlier, a shorter notice, by the same expert authority, was given of the disease as affecting sheep. As these articles are of such very recent date, we must refer our correspondent to them.

COMMUNICATIONS RECEIVED FOR THE WEEK ENDING SATURDAY, JUNE, 8TH.

G. H. W.—E. F. M.—S. W. J.—M. W. F., thanks—J. M. R.—H. G. T.—E. W. S.—S. R. M., ! !—L. A. R.—D. E. S.—R.—S. B. P.—S. P.—H. A. W.—"Subscriber"—W. S. McE.—A. J.—A. M. Van A.—"A Devoted Reader"—B. P. NORTH CAROLINA NOTES.

TREATMENT OF CHICKENS AND CLOCKS.

THE turkey wanted to sit before she had a full nest of eggs, and when a week had passed, we added a few Houdan hens' eggs. No little turkeys made their appearance and it was hardly profitable for a turkey to spend her time in the care of only five Houdans. The weather being cold and wet, they were placed in a box by the kitchen stove. The cat and her two kittens chose the same lodgings and all slept together until the weather became dry and pleasant. Now, the chicks run at will out of doors during the day and are thriving better than others that have had the care of their feathered mothers. I expect them to be somewhat of a nuisance about the house before they are grown. We are feeding our chickens coarser meal—corn merely cracked—than ever before and are suffering less losses. Whole grain is undoubtedly the best feed when they are large enough to swallow it.

Some of our neighbors are losing their poultry by cholera; ours are healthy yet. We had our turn last year and hope to escape this summer. There seems to be no first cause for the malady, though it appears to be contagious; no preventive and no cure, though we are feeding a little sulphur, thinking it can do no harm and possibly may prove beneficial. Will Col. Curtis please report, through the RURAL, the result of the Guinea-fowl-potato-beetle experiment?

When the first cold weather came last winter, the old clock, that has done duty for many years, refused to run o' nights, and finally stopped entirely. I removed the face and found the cause to be dirt. It was several miles to a clock tinker, and then he would charge me at least a dollar for the job. I concluded to undertake the task; but not feeling competent to put it together properly again, if I cleaned each piece separately, I tried another plan. A kettle of boiling soap-suds was prepared on the stove, in which the works were boiled for a half-hour, then another half-hour in clean water; then thoroughly dried and a few drops of oil applied, after which the clock was replaced in the case and set going. Judging from results, the work was never better done. The old clock knocks off the hours and minutes with as great precision as when it received its yearly cleansing at the hands of a professional tinker at the cost of a dollar or two. Caution: Do not boil a wooden clock; the consequences might not be just desirable.

M. B. PRINCE.

NOTES FROM TEXAS.

HARRIS CO., Texas, June 1, 1878.

THE weather continues very dry and vegetation suffers. Gardeners about here feel discouraged, for this state of things prevents them from sowing or planting anything in the line of summer vegetables, to keep up a succession. This drought does not extend over the whole State, however. Further up the country crop reports are very favorable. The wheat crop, in the upper counties, is mostly laid by and is reported to have been an extra good one.

First peaches came to this market on the 20th of May. Early grapes will ripen through this month; I see some Delawares coloring. Tomatoes are plentiful. Irish potatoes are selling at 40 cents per bushel; onions at 60 cents.

Pearl Millet (Penicillaria spicata) of which the RURAL sent me a sample to try in Texas and report on, is seven feet high and is just developing its seed-spikes, which are from 12 to 15 inches in length. Every plant is a mass of luxuriant foliage. It was sowed the first week of April last, and we have never had a good rain since then. Despite the prevailing drought, however, the millet kept growing right along. The stool of the plant throws out new shoots constantly, which take the place of old ones when cut off. The leaves partake more of the succulent character of corn-fodder than of the rigid stiffness of some plants of the millet kind. I doubt not it will prove a very valuable forage plant, especially in a hot and dry country.

G. MARTI.

ROCKFORD, Ia., May 31.

WE are having a great deal of rain here, and the weather is cold and backward. It is a hard time on corn, and wheat begins to show the effects of the excessive wet. A larger area is sown to wheat than ever before and less to corn. A great many think, because the winter was so warm, the summer will be cold, and did not venture with corn. Many fields have had to be replanted. All farm products are low; hogs, $2.20; wheat, 80 cents; corn and oats, 25 cents; butter, 8 cents; eggs, 6 cents. Times are hard and our National Congress seems determined that they shall remain so. W. L. MC-E.

BARRINGTON, Yates Co., N. Y., June 3.

SPRING commenced about three weeks ahead of time after a very mild winter and considerable plowing was done and some grain sowed very early; but, with a few exceptions, the early-sowed grain is not looking well, for May was very cool. It appears therefore that spring crops are not so very much ahead after all, but winter grains and grass are well advanced and promise abundant crops. W. H. O.

ATLANTA, Ga., June 3.

WEATHER warm and dry, no rain to lay the dust since the first of May; crops suffering to some extent. Wheat now harvesting and looking promising. Fruit of all descriptions is very heavy. Cotton and corn looking well; sweet potato planting delayed in consequence of dry weather. Early Irish potatoes ready for digging, and early corn in "roasting ears." Farmers well up with their work. No prospect for rain yet. CHS. D.

BROOKSTON, Warren Co., N. C., June 1.

QUITE cool here. We expect to hear that you of the north have had another frost. M. B. P.

WARREN CO., N. C., May 27, 1878.

YESTERDAY was our first really hot day this spring. Vegetation is now growing rapidly; warm and frequent showers; wheat a little rusty. If the tales we hear of frozen fruit at the North be true, we are sorry for the growers, though perhaps we may reap a little benefit from their misfortune in the way of better prices for our own fruits. M. B. P.

SPRINGFIELD, Mass., June 4, 1878.

THERE is a great depression in business in this vicinity—worse than in any part of the country I have seen, and my business makes me see a great deal of it in many States. L. N. R.

ITHACA, N. Y., June 4.

FROST did but little damage here; the fruit prospect is fine. I. P. R.

WHAT THEY SAY OF IT.

THIRTEENTH WEEK.

The Rural Cricket to be Withdrawn, positively, the 1st of July.

The most Liberal and Valuable Present ever offered by any Journal.

"IT DRIVES AWAY THE BLUES!"

THE clock arrived safe. It far exceeds my expectations. Please accept my sincere thanks.

Spencertown, N. Y., June 3. M. W. A.

I RECEIVED the "Cricket" on April the 20th, and am well pleased with it. I send you my thanks even after so long a delay. S. H. F.

May 22.

THE clock received all right. We are very much pleased with it. Many thanks for the same. R. F.

Depewville, Jefferson Co., N. Y., May 27.

I RECEIVED the clock three days ago, all right. I am very much pleased with it. It fully satisfies my expectations. ADDA L. W.

River Falls, Wis., May 28.

THE "Cricket" was received the 1st of May. I wound it up and it has not varied two minutes since, without any regulating. We have concluded it to be the Boss time-piece for the money. H. F. H.

Mifflin, Ashland Co., Ohio, May 23.

THE Cricket "a thing of beauty" has come, gladdening the hearts of the office employes, and constantly reminding them of its presence with its tick, tack—tick, tack. J. H. H.

Racine, Wis., June 1.

I FEEL that I owe you a second acknowledgement of our thanks for the "Cricket." It keeps excellent time now, and has such a cheerful crickety sort of a tick that we are much attached to it. MRS. M. H.

Bath, Pa., May 18.

THE beautiful little "Cricket" arrived safely by express. We tried it for a week but it ran so rapidly, gaining two hours in a single night, that we were obliged to take it to a silver-smith to be regulated. It is now doing well. T. N. R.

Newport, Ky., May 25.

THE "Cricket" clock received all right. It is a perfect little beauty, looks so cute and cunning; and then it has such a clean, cheerful, pleasant face, and clear, distinct voice. It not only keeps correct time, but drives away the blues. I am more than satisfied with it. E. R. L.

Sedalia, Mo., May 18.

PLEASE pardon my delay in acknowledging receipt of the "Cricket," but I wanted to test it before doing so. I have found it every thing a clock need be. It keeps excellent time, is ornamental, and what more could be asked? I feel that I have made either a good paper or a good clock clear by subscribing for the RURAL.

Washington, D. C., June 3. C. S. T

THE "Cricket" came safely, and runs well so far. If it continues to work in the same manner, I shall think it worth much more than the cost. A. J. H.
Oaktown, Ind., May 22, 1878.

THE clock came quite safely and I like it very much. It is neat and substantial. After the test of a few days I find it keeps good time. Many thanks. AUGUSTA F.
Northfield, Mass., May 28, 1878.

WE received the clock May 25th, and are very much pleased with it. It fully equals our anticipations of its beauty and worth. All our friends admire it and "wish they had one just like it." Many thanks. A. G.
Cameron Mills, N. Y., May 28, 1878.

WE received the "Cricket" in good order, and hardly know how to express our many thanks. Think it a "gem," and would not part with it for double its cost. Every one that sees it admires it. May be able to send you another subscriber before the time for the premium expires, in consequence of the presence of the "little beauty." Mrs. G. S. W.
North Lansing, N. Y., May 27, 1878.

PLEASE find inclosed $5.00 for two new subscribers to the RURAL and one "Cricket" clock. This makes the fifth clock and seven copies of the RURAL that I have sent for this spring. All are well pleased with the paper and clock so far. J. B.
Miller's Station, Crawford Co., Pa., May 23, 1878.

I RECEIVED the "Cricket" safe and sound. It has gone splendidly ever since it arrived. We all like it, because it keeps such admirable time. It is invaluable. Please accept our thanks. W. L.
Hamilton, Ont., May 16th, 1878.

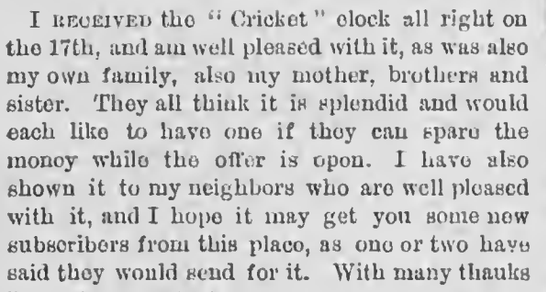
I HAVE received the "Cricket" in the best order, and set it going at once, and it has not varied a minute while I have had it—which is about ten days. Please accept my thanks for the beautiful present. L. B.
Columbia, Pa., May 20, 1878.

I RECEIVED the "Crickot" clock a few days ago, and have tried it for accuracy with my clock, and find it can keep right up with it. I must say it is much nicer than I expected it would be. I got it for my daughter for a school clock, and she is very well pleased with it, and thinks it just the cutest thing yet, in the clock line. J. K.
Mulberry, Ind., May 27, 1878.

I RECEIVED the "Cricket" clock all right on the 17th, and am well pleased with it, as was also my own family, also my mother, brothers and sister. They all think it is splendid and would each like to have one if they can spare the money while the offer is open. I have also shown it to my neighbors who are well pleased with it, and I hope it may get you some new subscribers from this place, as one or two have said they would send for it. With many thanks I remain yours truly. J. S.
Frankford, Pa., May 26, 1878.

I RECEIVED the "Cricket" clock you sent me as a premium, and hereby acknowledge my thanks for the same. This is the second clock you have sent me, which might look a little selfish, but I did not procure this last one for myself. My first one has proven to be a splendid time-keeper, and I have no fears but what the second one is just as good. The parties receiving the RURAL express great satisfaction and acknowledge it to be a valuable and useful household necessity. J. D. B.
Bettsville, Ohio, May 30, 1878.

Stock and Poultry.



OHIO IMPROVED Chesters produce more pork for food consumed than any other breed. Send for price list of pigs and choice fowls. L. B. SILVER, Cleveland, O.

HIGH-CLASS POULTRY.
Send for New Practical, Valuable Circular.

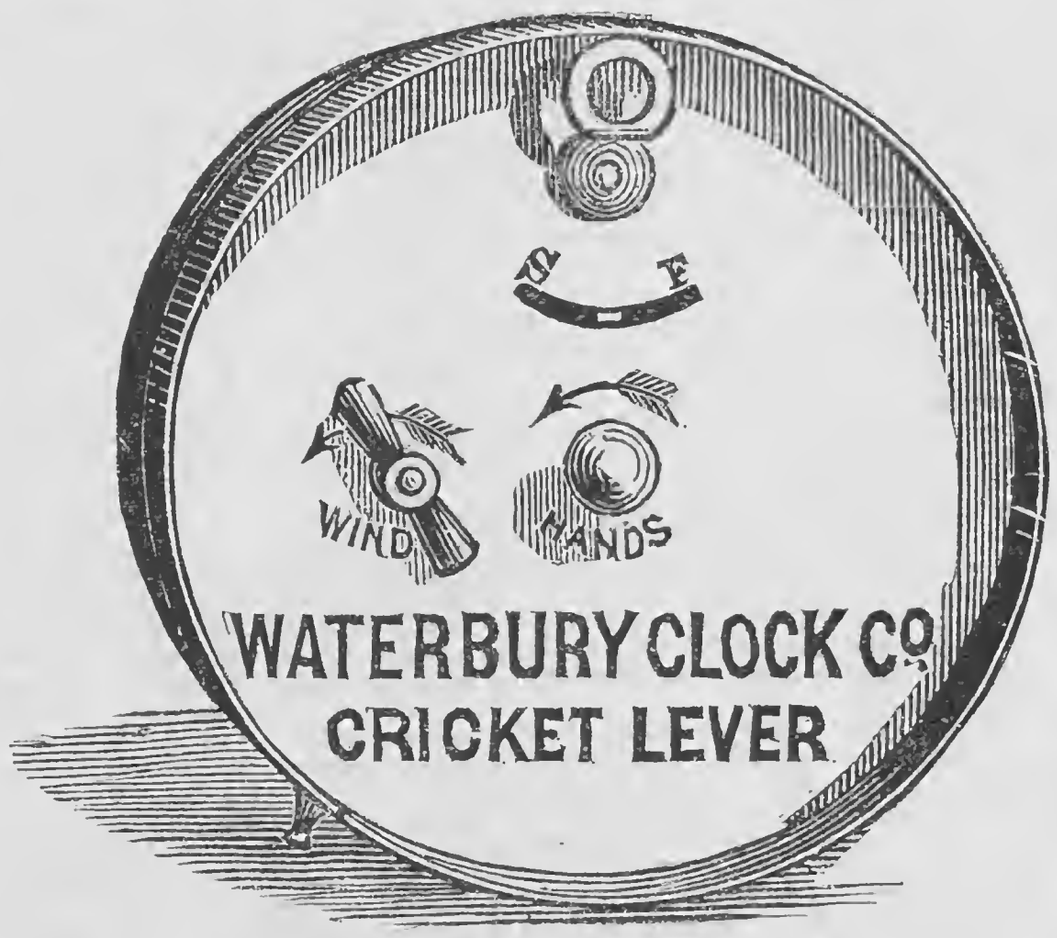
$350 A MONTH.—Agents wanted. 36 best selling articles in the world. One sample free. Address JAY BRONSON, Detroit, Mich.

THE MODERN CRICKET ON THE HEARTH
To be Withdrawn the 1st of July.

How to Secure an Elegant Time-piece without Cost and with very little Trouble.

THE OFFER ALL THAT IT WAS REPRESENTED AND MORE.

The Cricket for Two New Subscribers.



IT COMBINES THE BEST FEATURES OF BOTH CLOCK AND WATCH,
And May be Carried from Place to Place in a Trunk or Valise.

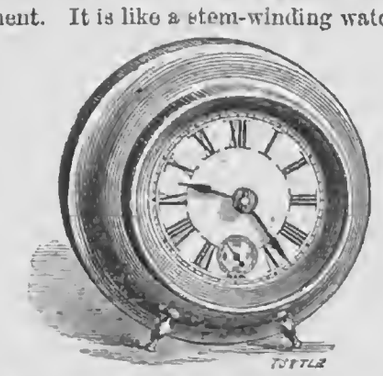
We want the Rural Cricket Clock in the Home of Every Subscriber.

THE MOST BRILLIANT OFFER MADE BY ANY JOURNAL.

To judge by its appearance many who have not seen it before, estimate its value to be ten dollars. We have been enabled, through the facilities afforded by our Experimental Farm (owned and operated exclusively for the benefit of RURAL readers) to make a FREE GIFT to our subscribers of a collection of rare and valuable flower seeds which have been enthusiastically received; and this gift on a still more liberal scale, *will be repeated during the present year.* Meantime, the RURAL itself has been enriched in all its departments, by contributions from the best writers and life-like illustrations, demonstrating that our enterprise has not been at the expense of the paper.

ECLIPSES EVERYTHING!

The "Rural Cricket" is inclosed in a beautiful circular metallic case of a single piece, and therefore without a seam. It is nickel-plated. The face of the clock is white and has a "second" dial as in watches. The works are securely inclosed so that no dust can penetrate and harm their movement. It is like a stem-winding watch, in that it requires.



NO KEY TO WIND IT!

and the hands are regulated without being touched. It runs thirty hours, is a chronometer-balance lever, jeweled, and it is guaranteed to keep as accurate time as the best watch.

IT RUNS IN ANY POSITION,

on its face, on its back, standing up, lying down, on its side, in short, in any position.

SIMPLICITY, ELEGANCE, DURABILITY.

It may be secured without any more effort than is required to tell its merits to a friend or so, and a sample clock will enable anybody so inclined to dispose of hundreds in a week.

THE OFFER.

FIRST.

Two New Subscribers

secure the clock! The lowest price of the RURAL NEW YORKER, except in clubs, is $2.50. Therefore upon the receipt of $5.00 and two names the sender is entitled to ONE "RURAL CRICKET."

SECOND.

We will send the RURAL NEW YORKER for one year and the Cricket Clock to any one upon the receipt of $3.50,

RURAL NEW-YORKER, 78 Duane St., N. Y.

New Publications.

DOSIA,

THE GREAT PRIZE NOVEL.

"Madame Greville's 'DOSIA,' the delicate and idyllic story of Russian life, is to be crowned by the Academie Francaise. It is called the best literary work of the year."—[Post.

"One of the brightest of the newly risen stars of French Literature is Henry Greville, as she chooses to designate herself. 'DOSIA,' her first novel, is an exquisite creation, pure and fresh as a rose, and will furnish the most *blase* devourer of fiction with a new sensation."—[Boston Transcript.

THE COBWEB SERIES OF FICTION.

Vol. I. Sidonie. By Alphonse Daudet.—Vol. II. First Love is Best. By Gail Hamilton.—Vol. III. Vineta. By E. Werner.—Vol. IV. Jack. By Alphonse Daudet.—Vol. V. Forbidden Fruit. By F. W. Hacklander.—Vol. VI. The Nabob. By Alphonse Daudet.—Vol. VII. Dosia. By Henry Greville.

Each volume 12mo. cloth, $1.50.

DARLEY SKETCHES ABROAD. With Pen and Pencil. Tourists' Edition. Price reduced from $2.50 to $1.50.

This edition is printed on fine supercalendered paper, and contains all the original illustrations.

ARTISTS AND ARABS; or, Sketching in Sunshine.

"Lovers of travel, artists and amateurs will equally be charmed with these literary and artistic sketches, which belong to the best class of our modern light literature."—[Episcopal Register.

Reduced from $1.50 to $1.

NORMANDY PICTURESQUE. By HENRY BLACKBURN. A new edition, with many additional illustrations. Reduced from $1.50 to $1.

FAMILIAR LETTERS FROM EUROPE. By C. C. FELTON, formerly President of Harvard College.

"These letters we consider among the very best that have ever fallen under our notice."—[Com. Bulletin.

12mo., 400 pages, $1.25.

NEW AND IMPROVED EDITIONS.

SATURDAY, JUNE 15, 1878.

WORK FOR AGRICULTURAL COLLEGES.

AGRICULTURE, of all industrial pursuits, most needs the knowledge gained through accurate experiment. Farmers have been so long accustomed to follow mere traditional routine, with no accurate investigation of the basis on which it rests, that real progress has been slower than in any other department of human labor. The rearing and feeding of stock for all the various purposes relating to human welfare, form an interest so large and of such vital importance, not only to our home interests but to our foreign commerce and the balance of trade, that the most accurate scientific and practical experiments are required to determine the physiological and economic laws that govern animal nutrition.

The two great classes of animal products that swell our foreign commerce—cattle and swine—produced for the year ending June 30, 1877, an aggregate export of $129,382,202—that is cattle products, including the dairy, $47,029,980; and swine products, $82,352,222. This is nearly one-fourth of all our exports, aside from coin and bullion, and, under good management in the future these products are likely to reach much greater proportions. The cattle products especially, may be doubled in a few years. The value of these products, for export, depends so largely upon quality, that only the best beef pays any profit. The most economical method of growing and fattening these animals, of producing butter and cheese, is the important matter now to be discovered.

Farmers, as a class, do not investigate; they do not now even see the necessity for such investigation; but after experimenters have worked out a better way, they may be prevailed upon to adopt it. Agricultural colleges were endowed by the nation to extend just this aid to agriculture, to become the investigating, informing mind of the industry. The college farm is expressly for experiment, and is intended to be equipped with all the appliances necessary for illustrating the specialties in agriculture carried on in the region where it is located. Here are, or should be, all the facilities necessary in the dairy region, for determining, by accurate experiments, the comparative value of the different breeds of cows, noting the weight of the animal, the amount of food consumed, per-centum of weight, the milk yielded per day, and for a given quantity of food, the milk required from each breed for a pound of butter and cheese, the relative proportion of butter and casein in the milk of each breed, the effect of various foods upon each breed in the laying on of flesh and production of milk, the effect of different conditions of food, cooked or raw, succulent, partially or wholly cured into hay, as well as the economy of pasturing or soiling animals, considered with reference to the quantity of land, capital and labor required by each system. In short, here should be taken into consideration every fact which will test the productive value of each breed for the purposes of the dairy under precisely the same circumstances. This system, carried out at a dozen experimental farms for a few years, would effectually settle the comparative value of the different breeds for the dairy, and the most economical manner of breeding and feeding them. These experiments alone would be worth more to practical agriculture than the whole cost of the endowment of the colleges.

A like system of experiments should also be conducted in the breeding and feeding of animals for beef, pork and mutton—with accurate incidental experiments showing the physiology of animal digestion, and thence the true scientific method of feeding to produce the highest result with a given amount of food. When will our agricultural colleges begin these experiments which shall be a vindication of the wisdom of their endowment?

IS A TURKEY AN ANIMAL?

WE remember having been taught, years ago, that all created things were divided into three great classes or kingdoms—known and denominated as the animal, the vegetable and the mineral. Certain things, it is true, are so constituted as to render it difficult to decide to which of two kingdoms they belong, standing as it were so nearly on the dividing line as to raise doubts on which side is their proper place. Others possess all the attributes belonging to one kingdom, and none of those of the other two, rendering it easy to decide where is their place in nature. Thus, none would hesitate before declaring an iron bar to be mineral, a tree or shrub to be vegetable, and, up to a recent date, that a turkey belonged properly to the animal kingdom. But the law decides differently, and have we not always been taught that the very foundations of law are laid in common sense? That a turkey is not an animal has been declared by the Court of Hartford county, Connecticut, in a recent decision of one of its Judges.

It seems, from the record, that two neighbors, or perhaps we should say parties whose farms were adjoining, living in Bloomfield, in said county, became unneighborly. A sow, with her infant progeny, belonging to A, trespassed on the domain of B. Search being made the animals—no question about pigs being animals has been raised—were found and returned to their proper quarters, but on counting them it was found the number was one less than it should be. Search being made the future promise of bacon and sausages was found snugly stowed away in a box on B.'s premises. B. denied that the pig belonged to A., and there were no distinguishing marks upon it by which A. could identify it.

Soon after some of B.'s turkeys, leaving their native habitat, strolled through, over or across the fence, and were found regaling themselves on the fruits of A.'s labor. A. saw his opportunity. The law made and provided for protection against trespassers, gave him, as he supposed, permission and authority to impound the intruders, which he proceeded to do forthwith, sending notice to B. of what he had done, and adding that he could have his turkeys when the pig was returned, and one dollar paid for damages. B. was wroth, and refused to comply with the demand. Contrarywise he sued out a writ of replevin for the turkeys and brought the matter before the court. The facts in the case were not disputed, but long and able were the arguments of learned counsel. The words of the statute were discussed in their various bearings. Had the intruder been an ox or a horse, or even a goose, so the judge decided, the action of A. in impounding it, them or either of them, would have been legal, but nowhere and in no way in the law relating to the case, was turkey mentioned or even referred to. Consequently verdict was rendered for B. who was adjudged one dollar damages and costs of suit. We are anxious to know what became of the *pig*.

THOMAS B. MINER.

ON Wednesday, June 5th, at his beautiful home in Linden, N. J., THOS. B. MINER, Esq., one of the oldest agricultural and horticultural editors of this country, paid the debt of nature, after a brief illness. As Mr. MINER was to a large degree a public benefactor, it may not be out of place at this time to give a brief history of his career.

He was born at Colchester, Conn., in the year 1808. At the age of sixteen years he left home for New York City, where he engaged in commercial pursuits until 1849 when he removed with his family to Clinton, N. Y., and at once began to develop those agricultural and horticultural tastes which culminated in such a grand success in after life. Then, in 1852, he established a monthly paper called the Northern Farmer, which became so rapidly popular in the country districts, that it had a circulation of 30,000 in the second year of its publication. It was while publishing this journal that he wrote several works of much practical value on different branches of husbandry, the best known of which immediately became authority on bee-keeping and poultry-raising. Encouraged by his success with the Northern Farmer, Mr. MINER subsequently merged it into a semi-monthly paper called the Rural American, which proved financially a very profitable investment. Finding, however, that the severity of the climate, and the shortness of the season, greatly interfered with his successful propagation and distribution of small fruits, in 1867 he purchased a large farm within the city limits of New Brunswick, N. J., whither the following year he removed with his family and business. But whether it was owing to the change to a new place, or the fact that by this time nearly every paper, both religious and secular had adopted the plan of publishing an agricultural and horticultural department, the Rural American failed to prosper in its new home; and after a brief struggle with adverse circumstances, its publication was discontinued.

Always frail in health, Mr. MINER now began to feel the weight of advancing age, and though his capacity for mental labor still remained unimpaired, bodily infirmity forbade his well-digested plans with reference to the cultivation and propagation of small fruits, and an opportunity offering, he sold his New Brunswick farm, and in 1872 removed his family to Linden, N. J., where he continued to reside until the time of his death, which occurred as stated on Wednesday, June 5th. Few men of his generation accomplished so much of thorough, earnest, literary work. His mind was quick to conceive and quick to execute, and its versatility was truly marvelous. It mattered little to him whether the subject was religion, politics, letters, or his more chosen pursuits. His reading had been so extensive and his practical knowledge with reference to the great questions of the day, was so exhaustive, that whatever left his pen would generally challenge the severest criticism.

But his chosen field was rural writing, and here he had few equals. He wrote rapidly, seldom revised his work, and some of his best literary efforts were accomplished while he was carrying out the details of a vast and complicated out-door business. But it is not so much to his literary work that the public, and particularly the rural portion of it are indebted, as to what he was able to accomplish in the way of originating and disseminating valuable varieties of vines, fruits, potatoes, etc., and of improving on well-known and long-cultivated varieties. Here he was eminently at home, and no year was allowed to pass by without his developing in this direction some practical result of general value to the community. This was especially true of the last few years of his life; and up to the week prior to his death he was actively engaged in bringing about results from which the homes of our land will yet receive a substantial benefit.

Mr. MINER has contributed regularly to our columns during the past year and our readers will join with us in deeply regretting his loss.

Why?—A music teacher in a Pennsylvania Female College kissed one of his pupils. The young lady was taken home. The rest of the young ladies went in a body to the President and demanded the dismissal of the offending Professor. Were they indignant at having been slighted? This Professor could not have been well versed in the way of womenkind or he would have known enough to have served them all alike. He should have remembered—

"Hell hath no fury like a woman scorned."

BREVITIES.

YOUNG chickens like radish tops.

WE call attention to what G. Marti says of Pearl Millet in Texas.

HOUSTON (Texas), is going to have a horticultural exhibition during July or August.

AFTER the Scotch, Austrian and White Spruce, the Golden Retinospora is the hardiest of evergreens on the cliffs of Newport in the sea air.

MR. LEACH, a progressive farmer within ten miles of the RURAL GROUNDS, destroyed 504 nests of Tent-caterpillars three years ago. Two years ago he destroyed 122 nests, and this year, thus far, 54.

WE do not know of any plant whose leaves at this time are as golden-hued as those of Sambucus aurea. The leaves of the golden-leaved Ninebark are bright when they first unfold—but the color soon fades away.

RURAL GROUNDS June 10.—Cold nights continue. Strawberries rotting. Melons in *statu quo*. Many potatoes were too much injured by the late frost to make further growth. We have had very little sunshine since last week, and rather more rain than has been needed.

IT is becoming apparent that something has destroyed the eggs of the potato beetle in this section of country (Bergen Co., N. J.) Some attribute it to our sharp frost—others to wet, cloudy, cold weather. There are so few either of the larvæ or old beetles that the use of Paris-green is unnecessary.

TOUCHING upon the strawberry disease referred to elsewhere, we find the following in the semi-weekly *Tribune* of the 4th inst.: Would-be strawberry-raisers are sad in southern Illinois because their plants are visited by a deadly disease, which some call "rust" and others "blight," something similar to pear-blight or rot in grapes. The cause, it is popularly thought, may be "weather" or "insects."

EXPERIMENTS made upon the Colorado potato-beetle in its perfect state in summer and fall, analogous to those which should be made upon the wintered beetle in spring, show that it lives from a month and a half to two months in the beetle condition. Mr. Shimer, of Illinois, kept some seven months and a half, or six months after they had got through laying their eggs, and only lost them then by accident.

WE are convinced from experiments of our own and those of others that if Paris-green is thoroughly mixed with a divisor, let it be flour, plaster or any other, the proportion of Paris-green need not be nearly as great as that commonly deemed necessary. We know that one part of Paris-green to fifty parts of plaster will kill the beetles and a friend tells us that one pound to a *barrel* of plaster, if only it be thoroughly intermixed, has proven effectual with him.

A CORRESPONDENT of the Germantown Telegraph supposing that sorrel was induced by a sour soil, applied lime, ashes, soda and everything he could think of to neutralize the supposed acidity, without avail. As sweetening the soil availed nothing, he tried the effects of rendering it more sour by applying apple pomace from the cider mill. Then he harrowed it in and sowed to grass seed. The sorrel disappeared. Here is a clear case for the Homeopathic doctrine "similia similibus curantur."

NOW we should thin out our Apples and Pears if it has not already been done or if there is any intention of doing it. Few farmers are willing to take the pains to thin the fruit, though few there are who do not think that overbearing injures the trees. Mr. THOMAS says that the farmer who takes care not to have more than four stalks of corn in a hill and who would consider it folly to have twenty, never thins any of the twenty peaches on a small shoot. The gardener who would allow twenty cucumber vines in a hill, would be called an ignoramus by his neighbor, while at the same time he suffers a dwarf Pear to bear five times as many pears as it could profitably mature. If we would plant two Duchess dwarfs—side by side—thin out the fruit of one and leave the other to bear all that it would, we should, in a few seasons, be convinced for ever afterwards of the desirability of the practice.

DR. STURTEVANT speaks thus free-heartedly respecting the retirement of his late associate from the Scientific Farmer:—"Mr. E H. Libby, the founder, and until recently connected with the Scientific Farmer as editor, has severed his connection with us, and taken possession of a larger field, where his sterling qualities will tell on a larger constituency. He takes the position of managing editor of the American Agriculturist, a paper already widely known for its good work, and which under the new management cannot fail to continue its career of usefulness under the auspices of a young and vigorous mind, fully alive to the necessities and demands of the age. We regret his loss to us, as will our readers; but we cannot but rejoice in the opening to him of a career full of responsibilities and promise. He has our heartiest wishes for his success, and carries with him our belief and faith that in this new position he will meet the high expectation of his many and warm friends."

Literary Miscellany.

OUR TO-MORROWS.

FANNIE R. ROBINSON.

THE sky had been sunless and dun all day;
And dreamy and soft fell the faltering snow;
And the startled swallows had fluttered away
To the roses and summers that love them so;
And the story of Greece and her glorious dead
In the sweet long dreaming was all unheard;
And the grammar was tame, and I learned, instead,
The wonderful speech of a passing bird.

Till the darkness fell on an empty day,
And the winter sun grew cold and dim;
And the chattering sparrows would not stay
A moment longer to court my whim.
I remember the flush of gradual shame
At the vacant places beside my chair;
And just how the wasted moments came,
Like mocking spirits, to haunt me there.

But down the length of the homely room
I caught the fall of a patient tread;
And where, O childhood, were tears and gloom,
As a loved hand lifted a drooping head?
While even to childhood's untutored ear
There throbbed a hint of remembered pain
Through the comforting words, "Never mind it dear!
To-morrow we'll both begin over again."

I have learned "to be" and "to suffer" since then,
And I know the tale of the Golden Age;
And without the swallows have learned again
The weary lessons of life's hard page.
But oh, when the day and darkness meet
I hear, like the echo of some refrain,
Like the chant of a promise, low and sweet,
"To-morrow, my child, begin over again."

Oh! blessed pardon of empty days!
Oh! sign of a harvest still to reap!
Who talks of an end to our wearisome ways?
Who sighs for the coming of careless sleep?
Beyond the borders of our despair
God's fair Forever is just in sight:
And, all unsullied by earthly wear,
He keeps His To-morrows new and white.

[*Sunday Afternoon.*

CORA.

CHAPTER XXIII.

"OF course you must be aware of my business, here to-day, Cora," said Sir Alan, without looking at her, or changing his dejected attitude;" and even to you, it must be painful, and I will try to be as brief as I can. You know, or at least you can guess, why I left you so suddenly last night, and the object of my journey to Bologne?"

She inclined her head, but did not speak.

"Will you tell me what your wishes are?" he continued. "I want, if possible, to save you from further sin. Of course, after what has occurred, things can never be as they have been, but if I can save you from going headlong to destruction I will do so. Do you know to what you exposed yourself by you flight, to what depths of misery and crime you might have sunk? You have had time to think over it quietly to-day; do you not recoil with horror from such a prospect? No, there can be no explanations. Do not trouble yourself, for your actions, and their intent cannot be explained away; they are self-evident."

He paused a moment, but he did not speak or move.

"I loved you," he went on, with suppressed passion, now, in the tones which had been so clear and cold. "I loved you so dearly that the mere suspicion of your guilt was almost unendurable anguish. Cora, when I saw you last night coming toward me, I could have welcomed death; I could have prayed for it to save me from the knowledge of your dishonor. Nay, I know what you would say; I know what he tried to make me hear last night: 'That you were chance travelers!' Bah, what a madman you must think me! Ah, if I fought, it was not because I believed you innocent, but because I knew you guilty, and because I was mad, and could have killed him as he stood."

She shivered, and lifting her eyes to his, asked, mutely, a question she dared not ask with her lips.

"You are anxious for his welfare?" he said, with a bitter laugh. "He is unhurt, but you will not see him again. He had so much grace, that he swore never to seek you again; and so much shame, that he did not lift his hand against the man he had so bitterly injured. But of what avail is all this? What do you wish to do? Where do wish to live?"

An expression of wondering surprise crossed her face; but Sir Alan, studiously avoiding a glance at her, did not see it.

"You are my wife," he said, in a few moments; "and were you not so, you have a special and sacred claim on my protection. I loved your brother well, and the promise I gave him I will keep to the utmost of my power."

"Oh, Harold, Harold!" she cried passionately—"my brother—my brother, who never judged me cruelly, who bore with me so tenderly,—would to heaven you had taken me with you, away from such misery as this:

"Pshaw!" said the baronet, impatiently. "I told you I abhorred scenes; let us cut this short, and cease such heroics. Tell me what I can do to keep you from sin, and I will try to meet your wishes?"

Cora did not answer for some minutes, she was struggling to repress her tears, and it was only when Sir Alan said quietly:

"I am waiting," that she raised her head and spoke: "Do you mean that you are going to send me away?" she said. "Do you mean that I I am not to be with you any more?'

He bowed his head in acquiescence, but made no other reply. His wife rose from her seat and clasped her hands despairingly.

"Do you mean that you are going to deny me the shelter of your roof? That I am to seek another home? If it be so, then I am willing; do with me what you will, I care not—I care not."

"I wish to make every arrangement for your comfort and respectability," he answered, his voice a little unsteady now at the passionate despair in her tone and manner. "Even after all that has passed, I desire but one thing—your happiness."

She laughed a bitter, tuneless laugh, as she turned away from him.

"I am ready when you wish," she replied; "I will do what you order. Am I not submissive enough now? Let me take my child and go."

"I cannot let you take the child," he said, quickly. "Ask yourself whether you are a fit guardian for him?"

"But you cannot take him from me," she said, beginning to tremble violently. "He is my child; you would not be so cruel—you could not take him from me—Alan, you will not."

"Can I, loving my boy, trust him to you, Cora?"

The words were very sadly but firmly spoken.

"But I could not live without him," she said, nerving herself to speak calmly. "He will be my only comfort now that you, his father,"—oh, the inexpressible pathos of her voice—"condemn me so entirely. If you had him, he could not love me; you might teach him to despise me. Alan, you will not—you will let me have him—in pity."

She had crept to his side and laid her little trembling hands on his arm. The touch thrilled him, but he turned from her resolutely, and shook his head.

"I could not trust him to you," he replied, trying to repress all signs of emotion.

"Not trust him to his mother!" She turned from him with a choked, wailing cry; a film gathered over her eyes; her gait became unsteady, and she rocked and fell forward, fainting away.

To spring to her side, to raise her in his arms, and press burning kisses on the pallid face and closed eyelids, was the work of a moment. Then Sir Alan laid her upon the couch, and, turning from her, bowed his head upon his hands and waited.

Cora's swoon was not of long duration. A few minutes after she slowly unclosed her veined lids, and raised her hand to her brow with a troubled gesture. One look at the bowed figure of her husband recalled to her mind the painful discussion in which they had been engaged.

She slid from the couch on which she lay, and dragged herself slowly—she was too weak to walk—to his feet. Then she clasped her arms around his knees, and rested her head against them with a moan of anguish, which went to her husband's heart.

"Alan, for Harold's sake!—for our boy's sake—forgive!"

CHAPTER XXIV.

For Harold's Sake.

For some minutes there was perfect stillness in the room. Not a sound broke upon the silence within, although from without came the gay chatter of the passers-by, or the rumbling of a passing cart.

Suddenly, some one below began to play a concertina, and the tune played—the "Miserere" out of "Il Trovatore,"—sounded sadly in the quiet room. Long afterwards, Cora could not hear that tune without pain.

Still, Sir Alan did not move, or look up, and still Cora crouched at his feet, her slender hands clasping his knees, her head resting against him, the masses of shining hair falling over her. It was thus he saw her when he raised his head at last—in her attitude of humiliation and abasement, praying for forgiveness.

"For Harold's sake—for our boy's sake!"

At last he spoke, and his voice, though husky and unsteady, had lost the bitterness and harshness of its former tones.

"Rise," he said. "Cora, I cannot see you thus."

And he put his hand upon her head, and tried to raise her; but she caught his hand in both hers, and broke into sobs, which shook her slight form with alarming violence.

"I will not rise—I will not rise," she said, until you have forgiven me."

With that he bent over her, and said a few gentle words of pardon and peace, and made her rise, and placed her gently back in the arm-chair; and the tears came more quietly then. When he saw that she was calmer, he rose.

"I will leave you now," he said, quietly. "This agitation has been too much for you. I hope you will try and rest, and I will think what is best to be done for your welfare and happiness, as well as for Harold's. I will see you in the morning."

He went away, leaving her in darkness, and alone—leaving her to wear away the long night hours with tears and prayers—leaving her to realize that he was lost to her forever, because he believed her guilty, and because she could not justify herself.

The next morning a letter was given to her. She recognized her husband's handwriting, and trembled as she broke the seal, and read the few cold lines it contained.

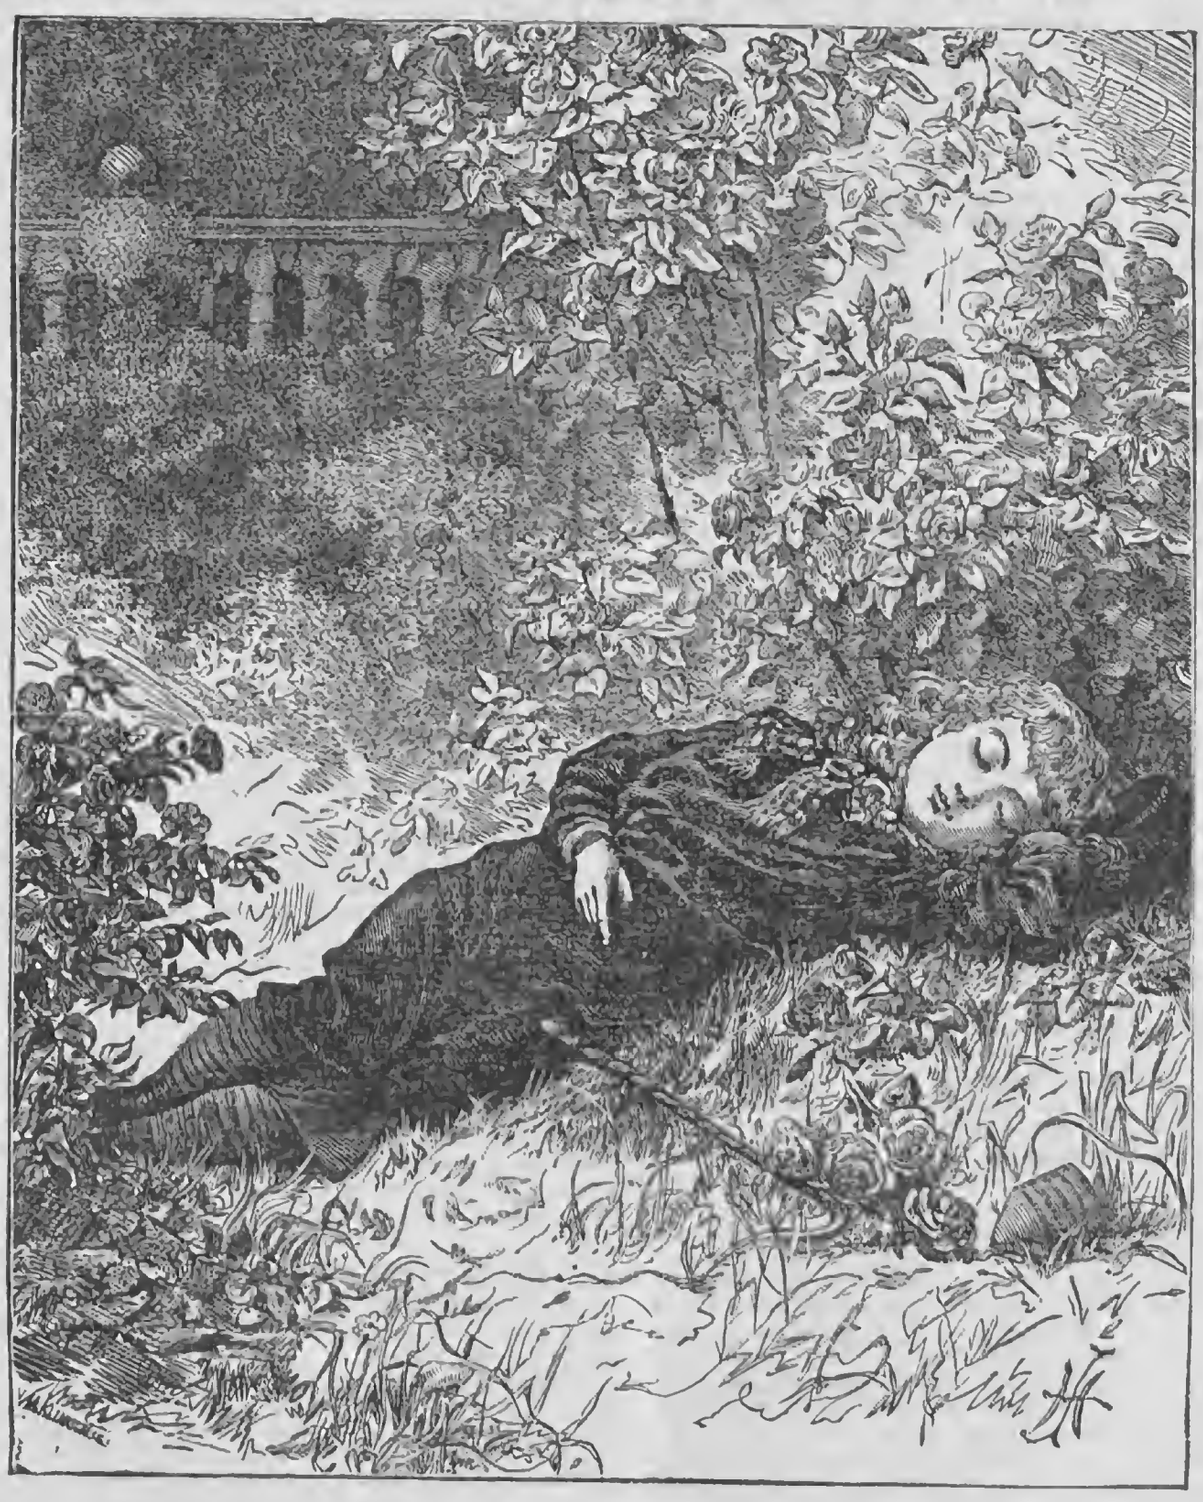
"The thought of being separated from Harold seemed to give you so much unhappiness that I have tried to avoid the necessity. Are you willing to return to London, and live in all *outward* respects as we have done since our marriage? We can meet as husband and wife in public, and before the world; alone, we can be strangers. I am the more anxious that you should accede to this proposal, because of the pain it would give my mother to know of the separation between us. It can be hid from her as from the world. If you will, I shall be anxious to know the decision. Will you tell your attendant one word for me: 'Yes,' or 'No?'"

"Tell monsieur 'Yes,'" said Cora, as she finished reading, and lay back with her cheek upon the letter, refusing the dainty breakfast Madame Dumoulin had prepared for her, but feeling happier at the thought of being with Sir Alan on any conditions, and, exhausted with sleepless nights and constant agitation, Cora fell into a heavy sleep, which lasted until the afternoon.

She awoke refreshed and better, and was able to meet Sir Alan at dinner with her usual self-possession, although the constraint between them was equally painful to both.

"Shall you be equal to a journey to Paris to-morrow?" he asked, as they separated at night "I do not want to delay, if possible, terminating my business there, and relieving Marks and your maid of their uncertainty."

"I will be ready." Cora said, quietly; although the start which the name of Marks produced did not escape Sir Alan, and the shade which seemed habitual on his face now deepened a little.—[To be continued.



SIESTA.

I, ZEPHYR, in the sultry noontide sighing,
Woo thee to slumber, ere I sink to sleep;
The nalads heavy-eyed are languid lying;
Through burning sands their lingering runnels creep.

Drowsed by the shrill cicala's weary crying,
The dryads dream, in hazel shadows deep.
Canst thou the sun-god's blighting beam withstand?
Sleep! the nymphs all are sleeping through the land.

PICTURE OF CONSTANTINOPLE.

What an Italian Prose Poet Saw There.

THE most remarkable work on the Turkish capital which has been born of the present interest in Eastern affairs is Edmondo de Amicis' "Constantinople." De Amicis is a poet, an artist, a wonder-worker with words, who so writes of what he has seen as to make his reader not only share the sight, but share also the mood in which it was seen, the emotions awakened and the impression left upon his own mind. The following is the author's description of the city and of the sights on the floating bridge across the Golden Horn:

"The vision of this morning has vanished. The Constantinople of light and beauty has given place to a monstrous city, scattered about over an infinity of hills and valleys; it is a labyrinth of human ant-hills, cemeteries, ruins and solitudes; a confusion of civilization and barbarism which presents an image of all the cities upon earth, and gathers to itself all the aspects of human life. It is really but the skeleton of a great city, of which the smaller part is walls and the rest an enormous agglomeration of barracks, an interminable Asiatic encampment; in which swarms a population that has never been counted of people of every race and every religion. It is a great city in process of transformation, composed of ancient cities that are in decay, new cities of yesterday, and other cities now being born; everything is in confusion; on every side are seen traces of gigantic works, mountains pierced, hills cut down, houses levelled to the ground, great streets designed; an immense mass of rubbish and remains of conflagrations upon ground forever tormented by the hand of man.

There is a disorder, a confusion, of the most incongruous objects, a succession of the strangest and most unexpected sights, that make one's head turn round; you go to the end of a fine street, it is closed by a ravine or precipice; you come out of the theater to find yourself in the midst of tombs; you climb to the top of a hill to find a forest under your feet and a city on the hill opposite to you; you turn suddenly to look at the quarter you have just traversed and you find it at the bottom of a deep gorge, half hidden in trees; you turn toward a house, it is a port; you go up a street, there is no more city; only a deserted defile from which nothing but the sky is visible; cities start forth, hide themselves, rise above your head, under your feet, behind your back, far and near, in the sun, in the shade, among groves, on the sea; take a step in advance, behold an immense panorama; take a step backward, there is nothing to be seen; lift your eyes, a thousand minarets; descend one step, they are all gone. The streets bent into infinite angles wind about among small hills, are raised on terraces, skirt ravines; pass under aqueducts, break into alleys, run down steps, through bushes, rocks, ruins, sand hills. * * *

"In the midst of Turkish houses rise European palaces; behind the minaret stands the bell-tower; above the terrace, the dome; beside the dome, the battlemented wall; the Chinese roofs of kiosks hang over the facades of theaters; the grated balconies of the harem confront the plate-glass window; Moorish lattices look upon railed terraces; niches with the Madonna within are set beneath Arabian arches; sepulchres are in the court-yards, and towers among the laborers' cabins; mosques, synagogues, Greek churches Catholic churches, Armenian churches, rise one above the other, amid a confusion of vanes, cypresses, umbrella pines, fig and plane trees, that stretch their branches over the roofs—an indescribable architecture, apparently of expediency, lends itself to the caprices of the ground, with a crowd of houses cut into points, in the form of triangular towers, of erect and overturned pyramids, surrounded with bridges, ditches, props, gathered together like the broken fragments of a mountain.

"In one quarter of an hour you must change your manner of proceeding ten times. You go down, you climb up, you jump down a declivity, ascend a stone staircase, sink in the mud and clamber over a hundred obstacles, make your way now

through the crowd, now through the bushes, now through a forest of rags hung out, now you hold your nose, and anon breathe waves of perfumed air. From the glowing light of an elevated open space whence can be seen the Bosphorus, Asia, and the infinite sky, you drop by a few steps into the gloom and obscurity of a net-work of alleys, flanked by houses falling to ruin, and strewn with stones like the bed of a rivulet. From the fresh and perfumed shade of trees into suffocating dust and overpowering sun; from places full of noise and color into sepulchral recesses, where a human voice is never heard; from the divine Orient of our dreams into another Orient, gloomy, dirty, decrepit, that gradually takes possession of the imagination. After a few hours spent in this way, should any one suddenly ask, "What is Constantinople like?" you could only strike your hand upon your forehead, and try to still the tempest of thoughts. Constantinople is a Babylon, a world, a chaos. Beautiful? wonderfully beautiful. Ugly?—It is horrible!—Did you like it? Madly. Would you live in it? How can I tell!—who could say that he would willingly live in another planet? You go back to your inn full of enthusiam and disgust; bewildered, delighted, and with your head whirling, as if cerebral congestion had begun, and your agitation gradually quiets down into a profound prostration and mortal tedium. You have lived through several years in a few hours, and feel old and exausted.

"To see the population of Constantinople it is well to go upon the floating bridge, about one-quarter of a mile in length, which extends from the most advanced point of Galata to the opposite shore of the Golden Horn, facing the great mosque of the Sultana Valide. Both shores are European territory; but the bridge may be said to connect Asia to Europe because in Stamboul there is nothing European save the ground, and even the Christian suburbs that crown it are of Asiatic character and color. The Golden Horn, which has the look of a river, separates two worlds, like the ocean.

"The news of events in Europe which circulates in Galata and Pera clearly and minutely, and much discussed, arrives on the other shore confused and garbled, like a distant echo; the fame of great men and great things in the West is stopped by that narrow water as by an insuperable barrier; and over that bridge, where every day a hundred thousand people pass, not one idea passes in ten years.

"Standing there one can see all Constantinople go by in an hour. * * * Whatever can be imagined that is most extravagant in type, costume and social class may there be seen within the space of twenty paces and ten minutes of time. Behind a throng of Turkish porters who pass running, and bending under enormous burdens, advances a sedan-chair, inlaid with ivory and mother-of-pearl, and bearing an Armenian lady: and at either side of it a Bedouin wrapped in a white mantle and a Turk in muslin turban and sky-blue caftan: beside whom canters a young Greek gentleman followed by his dragoman in embroidered vest, and a Dervise with his tall conical hat and tunic of camel's hair, who makes way for the carriage of a European ambassador, preceded by his running footman in gorgeous livery. All this is only seen in a glimpse, and the next moment you find yourself in the midst of a crowd of Persians, in pyramidal bonnets of Astrakan fur, who are followed by a Hebrew in a long yellow coat, open at the sides; a frowzy-headed Gypsy woman with her child in a bag at her back; a Catholic priest with breviary and staff; while in the midst of a confused throng of Greeks, Turks and Armenians comes a big eunuch on horseback, crying out, *Larya!* (make way!) and preceding a Turkish carriage, painted with flowers and birds, and filled with the ladies of a harem, dressed in green and violet, and wrapped in large white veils; behind a Sister of Charity from the hospital at Pera, an African slave carrying a monkey, and a professional story-teller in a necromancer's habit, and what is quite natural, but appears strange to the new-comer, all these diverse people pass each other without a look, like a crowd in London; and not one single countenance wears a smile. The Albanian in his white petticoat and with pistols in his sash, beside the Tartar dressed in sheepskins; the Turk, astride of his caparisoned ass, threads pompously two long strings of camels; behind the adjutant of an imperial prince, mounted upon his Arab steed, clatters a cart filled with all the odd domestic rubbish of a Turkish household; the Mohammedan woman a-foot, the veiled slave woman, the Greek with her red cap and her hair on her shoulders, the Maltese hooded in her black *faldetta*, the Hebrew woman dressed in the antique costume of India, the negro wrapped in a many-colored shawl from Cairo, the Armenian from Trebizond, all veiled in black like a funeral apparition, are seen in single file, as if placed there on purpose to be contrasted with each other.

"It is a changing mosaic of races and religions that is composed and scattered continually with a rapidity that the eye can scarcely follow. It is amusing to look only at the passing feet and see all the foot-coverings in the world go by, from that of Adam up to the last fashion in Parisian boots—yellow Turkish babouches, red Armenian, blue Greek and black Jewish shoes; sandals, great boots from Turkestan, Albanian gaiters, low cut slippers, leg-pieces of many colors, belonging to horsemen from Asia Minor, gold embroidered shoes, Spanish *alpargatos*, shoes of satin, of twine, of rags, of wood, so many that while you look at one you catch a glimpse of a hundred more. One must be on the alert not to be jostled and overthrown at every step. Now it is a water-carrier with a colored jar upon his back; now a Russian lady on horseback, now a squad of imperial soldiers in zouave dress, and stepping as if to an assault; now a crew of Armenian porters, two and two, carrying on their shoulders immense bars, from which are suspended great bales of merchandise; and now a throng of Turks who dart from left to right of the bridge to embark in the steamers that lie there. There is a tread of many feet, a murmuring, a sound of voices, guttural notes, aspirations interjectional, incomprehensible and strange, among which the few French or Italian words that reach the ear seem like luminous points upon a black darkness. The figures that most attract the eye in all this crowd are the Circassians, who go in groups of three and five together, with slow steps, big-bearded men of a terrible countenance, wearing bearskin caps like the old Napoleonic Guard, long black caftans, daggers at their girdles and silver cartridge-boxes on their breasts; real figures of banditti, who look as if they had come to Constantinople to sell a daughter or a sister—with their hands imbued with Russian blood. Then the Syrians, with robes in the form of Byzantine dalmatic, and their heads enveloped in gold-striped handkerchiefs; Bulgarians, dressed in coarse serge, and caps encircled with fur; Georgians in hats of varnished leather, their tunics bound round the waist with metal girdles; Greeks from the Archipelago, covered from head to foot with embroidery, tassels and shining buttons.

"From time to time the crowd slackens a little; but instantly other groups advance, waving with red caps and white turbans, amid which the cylindrical hats, umbrellas and pyramidal head-dresses of Europeans, male and female, seem to float borne onward by that Mussulman torrent. It is amazing even to note the variety of religions.

"The shining bald head of the Capuchin friar, the towering janissary turban of an Ulema, alternate with the black veil of an Armenian priest, Imaums with white tunics, veiled nuns, chaplains of the Turkish army, dressed in green, with sabers at their sides. Dominican friars, pilgrims returned from Mecca with a talisman hanging at their necks, Jesuits, Dervises, and this is very strange, Dervises that tear their own flesh in expiation of their sins, and cross the bridge under a sun-umbrella, all pass by. If you are attentive, you may notice in the throng a thousand amusing incidents. Here is a eunuch, showing the white of his eye at a Christian exquisite, who has glanced too curiously into the carriage of his mistress; there is a French *cocotte*, dressed after the last fashion plate, leading by the hand the begloved and bejeweled son of a pasha; or a lady of Stamboul, feigning to adjust her veil that she may peer more easily at the train of a lady of Pera; or a sergeant of cavalry in full uniform stopping in the middle of the bridge to blow his nose with his fingers in a way to give one a cold chill; or a quack, taking his last sous from some poor devil, and making a cabalistic gesture over his face to cure him of sore eyes. * * * *

"Seekers after the beautiful or the horrible will find their most audacious desires fulfilled; Raphael would be in ecstacies, and Rembrandt would tear his hair. The purest types of Greek and Caucasian beauty are mingled with flat noses and woolly heads; queens and fairies pass beside you; lovely faces and faces deformed by disease and wounds; monstrous feet, and tiny Circassian feet no longer than your hand, gigantic porters, enormously corpulent Turks and black sticks of skeleton shadows of men that fill you with pity and disgust; every strangest aspect in which can be presented the Ascetic life, the abuse of pleasure, extreme fatigue, the excess of opulence and the misery that kills. Who loves colors may here have his fill. No two figures are dressed alike. Here are shawls twisted around the head savage fillets, coronets of rags, skirts and under-vests in stripes and squares like harlequins, girdles stuck full of knives that reach to the armpits, Mamelukes' trousers, short drawers, skirts, togas, trailing sheets, coats trimmed with ermine, vests like golden cuirasses, sleeves puffed and slashed, habits monkish and habits covered with gold lace, men dressed like women, and women that look like men; beggars with the port of princes, a ragged elegance, a profusion of colors, tags, and fluttering ends of childish and theatrical decorations, that remind one of a masquerade in a mad-house, for which all the old clothes dealers in the universe have emptied their stores. * * *

"The first amazement over, the festive colors fade; it is no longer a grand carnival procession that is passing; it is humanity itself filing by with all its miseries and follies, with all the infinite discord of its beliefs and its laws; it is a pilgrimage of a debased people and a fallen race; an immensity of suffering to be helped, of shame to be washed out, of chains to be broken; an accumulation of tremendous problems written in characters of blood, which can only be solved by torrents of blood; and it is all horribly sad."

RECENT LITERATURE.

Adventures of an American Consul Abroad. By SAMUEL SAMPLETON, late United States Consul at Verdecuerno. Boston: Lee & Shepard.

THOSE gentlemen (their name is Legion) who are so solicitous of representing their country abroad, and whose ideas of the duties of representation are "a good salary and no work," will have the keen edge of their desire somewhat blunted if they read the truthful narrative of Mr. SAMPLETON. To start with his salary was munificent—$1,500 per annum! Out of that he was expected to pay house and office rent, servant and clerk hire, beside all other expenses incident to his position—cab hire, uniform for official calls and receptions. As may be expected, it required not a little very exact calculation to keep his expenses within limits of his income. Some of the make-shifts he had to resort to were extremely amusing, but for the most part the narrative is one to make an American feel humiliated that a representative of our country at a port whose trade is valued at $3 000,000 per annum, should be forced to present such a pitiable figure before the ambassadors of European governments.

So much for the salary: now for the duties. "When I was left alone, I began overhauling all the books, registers and papers of the consulate, and I was astonished at the amount of work, both in reports, statistics, shipping returns, correspondence with the Department of State, local authorities and four consular agencies there was to perform. The record of correspondence with the different authorities of the place and subordinate agencies was a perfect polyglot book. All the correspondence with the native officials was in the language of the country; that with the foreign consuls in French. I began afterwards to look over the register of correspondence received. It was still worse; for beside the above enumerated languages, there was also correspondence in German and several documents in Dutch that came from the Dutch consulate. I could not help thinking that Uncle ZACK's statement about their being nothing to do and plenty of money in such offices was all moonshine, as I found out to my cost. A great number of American ships came into port to load for the United States, and the masters thereof would be at my office half of their time to transact their business. There was hardly one who didn't have some trouble or other; and they brought them to me, expecting that I should settle them. I was constantly called upon to quell disturbances among the crews, settle wages and disputes, arrest men, send sick men to the hospital, discharge some, ship others, beside the endless variety of papers and documents of a legal form, each of which would take me three or four days' work to prepare them, as they were totally new to me, who had never studied law, and then I had to make several surveys of ships, surveys of cargo, depositions in cases of crimes committed on board, and correspondence with the police for disturbances committed on shore by members of the crews of our ships. At times I had to study day and night to prepare a single document or give a decision on any case and consult those dusty old books, the United States Statutes, and it often took me long hours to get at a single law passed by Congress."

Mr. SAMPLETON concludes his interesting narrative by pointing out the necessity for reform in our civil service. "There! how strange it is! Our Government sends men abroad, who, after hard labor and long experience, learn a complicated, delicate and responsible business, and no sooner have they learned it and are able to perform, creditably to themselves and to the Government they represent, all its intricate duties, than they are recalled and replaced by inexperienced men, who have to go through the same ordeal and never stay long enough to be of any real value to their country."

Studies in Luke. The Gospel according to St. Luke, containing the Original Greek Text, with an Interlined Word-for-Word English Translation, and a New Version based on the renderings of Eminent Critics, with Illustrative Explanatory Foot Notes and References. Also, an Alphabetical Appendix of Names, Weights, Coins, Words and Phrases used in the New Testament. By BENJAMIN WILSON. 12mo, 168pp., fine paper, wide margins, extra cloth. Price 60 cents. New York: S. R. Wells & Co., Publishers, 737 Broadway.

The almost universal use of the International Sunday-school Lessons has led to the publication, in a separate volume, of the Gospel according to St. Luke, the arrangement of which furnishes to the S. S. Teacher and Superintendent, and to the Bible Students generally, textual and other information of the most reliable kind. The entire plan of this work is both original and unique. There is a Greek text which is acknowledged to be one of the best extant, and a word-for-word interlined English Translation, the corresponding English term being placed directly under each Greek word. This, of course, gives to those who have an imperfect or no knowledge of Greek an unsurpassed opportunity to become acquainted with the language in which the Gospel was originally written, and will contribute to a critical understanding of any given part or subject. In a column on each page there is a New Version for general reading. This is based on the translation, and on the labors of many eminent critics and translators of the Scriptures, as well as on the readings of some of the oldest manuscripts now known. In this New Version emphatic signs are introduced, showing which of the Greek words were emphatic in the original, thus giving a *certainty* and *intensity*, a *vivacity* and *earnestness*, which are not found in the ordinary version. In connection with the above, the foot notes and references, and the various readings of ancient manuscripts, are very full, and placed at the bottom of the page. An Appendix arranged alphabetically, embracing the geographical and proper names, weights, measures, coins, precious stones, apostolic words and phrases, etc., contained in the New Testament, is added.

As most of the Christian sects—if not all—owe their existence to difference of interpretation, certainly every one is entitled to study the Scriptures for himself and to exercise his own intelligent judgment, and in this work the *literal translation* of the Greek being given, each student is enabled to make his own version. The work has received the approval of many eminent critics, and it is believed will be accepted as a great help by those for whom it has been prepared. S. S. Teachers who would furnish themselves with the best Lesson Helps should procure this. When the cost is considered, the price, 60 cents, is very low, and places this valuable work within the reach of all, and it is likely to have a very wide circulation.

The Rival Belles, or Life in Washington. By J. B. JONES. [Cloth; $1]. Philadelphia: T. B. Peterson & Bros.

MR. J. B. JONES is the well known author of The Wild Western Scenes and other stirring narratives of adventures in which class of fiction he excels. In the Rival Belles we have a story of society life as well as of adventure, the easy and natural development of the plot not being embarrassed by the number and variety of the incidents depicted, and the reader's interest is enchained from the beginning to the end. This is one of "PETERSON'S Dollar Series," which has become so deservedly popular both on account of the select volumes it embraces, and their cheapness and handsome binding. Others of this series are: The Matchmaker, a charming story of English life, by BEATRICK REYNOLDS. Aunt Patty's Scrap-Bag, by MRS. CAROLINE LEE HENTZ, and Miss Crispigny, by MRS. BURNETT. The last, though not comparing favorably in some respects with That Lass O' Lowrie's, is quite up to the standard of that book and will be eagerly welcomed by its admirers.

A Year Worth Living. By WILLIAM M. BAKER. Cloth; $1.50. Boston: Lee & Shepard.

A YEAR WORTH LIVING is a unique and rather quaint story. It is written in a concise, though easy and natural style which commends it to the reader at the outset. A striking feature is the number of "peculiar," not to say eccentric, people introduced, but their individualism is finely portrayed and preserved. Their whimsicalities are mirth-provoking at times and never wearisome or offensive. They teach in their peculiar ways lessons of unselfishness, benevolence and devotion as the hero and heroine teach them in theirs. A healthful moral tone pervades the book, imbuing the reader with a grateful consciousness of immunity from the harrowing details of intrigues, immoralities and the various other villainies so commonly deemed essential to the construction of an attractive novel.

Keramos and Other Poems. By HENRY W. LONGFELLOW. Boston: Houghton, Osgood & Co.

THE admirers of LONGFELLOW will be indebted to the publishers for collecting these poems—most if not all of them have appeared in the Magazines during the last few months—and giving them a permanent form. It would be like "gilding refined gold" to say anything in praise of this popular author. The simple announcement that a volume of his poems has been issued is enough to insure for him a wide circle of appreciative readers.

U. S. Commission of Fish and Fisheries. Commissioners Report 1875-76.

THE report of SPENCER T. BAIRD, U. S. Commissioner of Fish and Fisheries, embraces an inquiry into the decrease of food fishes on the Sea Coast and lakes of the United States, and a history of the propagation of shad, salmon and other species of food fishes. This will be found a volume replete with comprehensive information to those interested in the subject; the most valuable information because thoroughly reliable and instructive.

MAGAZINES.

THE ECLECTIC MAGAZINE for June, contains much exceptionally interesting matter. The article on "The Americans in Turkey," is replete with authentic information of the work accomplished by American men of letters, physicians and missionaries, and it well repays a careful reading. In the paper on "Impressions of America," by Rev. R. W. Dale, is presented an intelligent and just criticism of our national and social traits; a fair estimate of America by an English tourist is so rare as to warrant one's reading Mr. Dale if only for the variety of the experience. Goldwin Smith's paper on "The First Ten Years of the Canadian Dominion," we would commend to the careful attention of our readers, more especially those who are disposed to regard the U. S. as possessed of a monopoly of political sin. Articles on "Cruikshank," "Future Punishment," "Round the World in a Yacht," "Ancient Men and Ancient Times," and "The Farmer's Daughter," to "Ethel" and "Pope Leo 13th," complete this very fine number.

DEMOREST'S MONTHLY for June, maintains its usual standard of excellence. The literary matter, comprising stories, sketches, answers to correspondents, is alone worth more than the price asked for the Magazine (25 cents), and when to this is added the latest and most reliable information regarding fashions, it is evident that the purchaser gets a generous return for so small an expenditure.

AS USUAL, APPLETON'S JOURNAL for June, presents many and varied attractions—not the least of which are the exceedingly clever illustrations. "The American at Work," the opening paper, gives the Genesis and History of a Silver Dollar. The American antiquarian will find "South Carolina Relics" an interesting contribution. In this number By Celia's Arbor is ended, and an installment of "Jet"—Her Face or Her Fortune is added. Among the other prose contributions are: "Mrs. Gainesborough's Diamonds," "Otsego Leaves" by Susan Fenimore Cooper, "French Writers and Artists" by Wm. Winturn, and an amusing sketch, entitled: "Socrates a Reminiscence," etc. Poems are contributed by Earle Marble, Edgar Fawcett, Marie Le Baron, and others. The "Editors' Table" is crowded with discussions of timely topics, and Books of the Day receive their merited attention.

THE opening paper of THE POPULAR SCIENCE MONTHLY, is "The Age of Gymnastics" by F. L. Oswald, M.D., which, with the Essay by T. Clifford Allbutt, M.A. M.D., on "Brain Forcing," will repay careful perusal by those to whom has been entrusted the delicate task of educating the physical and mental resources of the young. "Water Waves and Sound Waves" (illustrated), is a timely dissertation by J. Norman Lockyer, F.R.S. The "Cardiff Grant and other Frauds," are thoroughly ventilated by G. A. Stockwell. "Illustrations of the Logic of Science," "The Scientific Study of Human Testimony," and other scientific papers make up this peculiarly edifying number. All the principal questions of the day in the scientific world are discussed in the Editorial Departments. There is probably no periodical of its class published which will afford greater satisfaction to the subscriber than this popular magazine.

BRIC-A-BRAC.

A MODERN SERENADE.

WAKE, dearest, wake and light thy gas,
Thou shalt not be alone,
For still for thee, my lovely lass,
I touch my telephone.
Though absent far from thee I am,
Yet softly on thy diaphragm
I give my sweetest tone.
And though away ten thousand miles,
I cannot see thy angel smiles,
Yet I can hear thy laugh.
And oh, unless fond hope beguiles,
Deceived with mechanic wiles,
I'll trust thy phonograph.
And as I grind thy accents out,
Then fading each fond jealous doubt,
I call thee all my own.
And absent yet, on thee I'll bet,
Bone of one bone, by telephone,
My better half, my phonograph,
My own, my own!

[*Musical Monthly.*

A BOYS COMPOSITION ON EDWARD VI.

HENRY VIII died one day with great success. He left threo children who did not care to go with him. Their names were Mary, Elizabeth and Edward. The last was the 'Ed of the family. He was a boy. His sisters were not. Their father also left a Will. His will was stronger than all his children. By will Earl Hertford was to boss the state while Edward was young. He was only ten years young. Hertford loved the glass so much he became a tumbler and was called the Duke of Summerset. He wanted the King to take the Queen—of Scotland—but the trick was lost because the Scotch refused to assist. The Duke was called the Protector because he protected his own family and put everybody else away in the Tower. The border men of England and Scotland were those who boarded on the frontier and bored each other almost to death; so they had a fight about Edward marrying their Queen. The English attacked them by water, which they couldn't stand. History says that the Scotch loss was ten thousand and the English two hundred. History lies, probably. The Government told the people what to believe. If they did as they were told they must pay taxes to support their belief. If they didn't do so they were roasted. Things were red hot. Somebody told stories about the Protector and so he was taken to the Tower and had his head chopped off. It was not much of a head, but he hated to part with it. Then there was a rising of the common people, but they did not know what for. Most of them got raised on to trees with ropes around their necks. Some very fat men were burned thus making light of their complaints. Now I guess it is time for the little King to die. He was only sixteen when he gave up the crown and the ghost. Finis.

TRAINING FOR THE REGATTA.

SOON as the faithful mantel clock
The hour of six A. M. shall chime,
He roseth from his downy couch,
And says, "'Tis training time."

Cold bathed and dressed he standeth up,
And fills the tumbler one-third full;
And as he drains the potent cup,
He takes his morning "pull."

And when he spendeth through the day,
Much more than he can earn,
To make the balance up at eve
He seeks his father stern.

But when, enrobed in party dress,
He gazeth upon beauty's brow;
With genuflexions graceful, then
He standeth at the bow.

Oft as glad pay-day bringeth round
It's glittering piles of silver store;
With joy unto his work he bounds,
And gladly grasps his ore.

And if the tiger tempteth him
To buck against the fierce Ke-*no*,
He seeketh that his checks may lie
Upon the upper row.

When'er the banquet board invites
He handleth knives and forks true,
And the glorious deeds of his crew recites—
The trusty, faithful corks crew.

[*Appleton's.*

THE Emperor of Austria's first meeting with his future Empress was romantic. One of her sisters had been destined for the imperial throne, and when Francis Joseph in his hunting dress arrived one evening at his father-in-law's residence on the Traunsee, he was received by four young ladies of the family, who have all since then made excellent marriages. As he was chatting with the group he saw an apparition of beauty, with magnificent hair floating over the shoulders, illuminated in the full glow of the sunset, approaching them from a neighboring wood. It was the Princess Elizabeth, the fifth of the sisters, and the Emperor from that moment became her slave.

"JUST A FEW WORDS."

JUST a few words, but they blinded
The brightness all out of a day,
Just a few words, but they lifted
The shadows and cast them away.

Only a frown, but it dampened
The cheer of a dear little heart;
Only a smile, but its sweetness
Check'd tears that were ready to start.

Oh! that the rules of our living
More like to the golden would be!
Much more, so much more, of sunshine,
Would go out from you and from me.

WHEN Freedom from her mountain hight unfurled her standard to the air, she little thought that naughty men would advertise hop bitters there.

For Women.

CONDUCTED BY MISS FAITH RIPLEY.

FIAT JUSTITIA.

LOUISE CHANDLER MOULTON.

YES, all is ended now, for I have weighed thee—
Weighed the light love that has been held so dear—
Weighed word, and look, and smile that have betrayed thee,
The careless grace that was not worth a tear.

Holding these scales, I marvel at the anguish
For thing so slight that long my heart has torn—
For God's great sun the prisoner's eyes might languish,
Not for a torch by some chance passer borne.

I do not blame thee for thy heedless playing
On the strong chords whose answer was so full—
Do children care, through daisied meadows straying,
What hap befalls the blossoms that they pull?

Go on, gay trifler! Take thy childish pleasure—
On thee, for thee, may summer always shine—
Too stern were Justice should she seek to measure
Thy fitful love by the strong pain of mine.

WOMEN IN COUNCIL.

Judge Hilton Branded as the most Conspicuous Fraud in the History of American Charities.

As most of our readers are doubtless aware the much advertised Women's Hotel has ceased to exist. Judge HILTON assigned as a reason for its collapse his inability to make the enterprise a success, resulting as he maintains from women obstinately refusing to avail themselves of his charity (?) because men were banished from the hotel. He was at great pains to make various other uncomplimentary comments on women. His statements were so manifestly untrue and wore beside so insulting that it was to be expected that the women of New York would resent his unmanly insinuations.

Accordingly a mass meeting was called for Tuesday evening, June 4, to express sympathy for the cheated, defrauded and insulted working girls of New York and to publicly denounce HILTON as the betrayer of trust and maligner of women. The meeting was successful beyond the most sanguine expectation of the ladies having it in charge. The large hall of Cooper Union capable of accommodating 2,500 was filled, the aisles and halls even being crowded, while hundreds lined the street unable to get into the building.

Sensible, womanly speeches were made by MATILDA FLETCHER, LILLY DEVEREAUX BLAKE, Mrs. SLOCUM and Mrs. Dr GILL. It is a noticeable fact that the only reference made to Judge HILTON'S coarse remark "that all women expected and hoped to marry and they wouldn't therefore shut themselves up in the Womans' Hotel, away from all chances of realizing their hopes," was by Mrs. BLAKE, who dismissed it in two sentences in which, to the amusement of the audience, she admitted that women wanted to marry, and added "and so do the men." This latter brought down the house. And yet a certain class of journals have spoken of this demonstration as the result solely of an eager desire on the part of women to stamp with execration Judge HILTON'S unhallowed suggestion that his "hotel was left empty because it wasn't a good place to find a husband."

It is to be regretted that we have not space to give a full report of the speeches. They were exceptionally good.

Those who are familiar with the onerous rules enforced while the hotel was used for women exclusively, will appreciate the following

FEW KIND SUGGESTIONS.

Before taking her seat Mrs. Fletcher said she would read a set of rules for the government of the hotel under the new dispensation, which had been presented by some wealthy ladies who did not care to have their names mentioned. The suggestions were made in good faith, and all kindness, for it was feared that, as it had taken Judge Hilton nine years to frame the rules under which the hotel was run for women, he would be a little confused and embarrassed in framing a constitution for the new concern. She then read the following set of rules, which were applauded to the echo, each and every one of them:

THE RULES.

1. Breakfast from six to eight; luncheon, twelve to one; dinner six to eight P. M. Charges fifty per cent. more or less than in other expensive places.

2. Gentlemen on returning from labor are requested to divest themselves of overalls, aprons, boots, &c., in the east dressing room, set apart for that purpose.

3. Women having failed to avail themselves of the privileges of the hotel are rigidly excluded from the walls, the management thereby hoping to insure "peace, prosperity and happiness" to the inmates.

4. The application of gentlemen engaged to be married, or otherwise matrimonially inclined, will be positively rejected.

5. Applicants for admission must be made by letter and be indorsed by twelve prominent women of New York.

6. The service of the hotel will be exclusively performed by men; no women need apply.

7. Smoking, chewing, spitting, swearing, singing, talking above a whisper in the dining-rooms, parlors or bedrooms expressly forbidden.

8. Gentlemen are requested not to shave or shampoo themselves in their bedrooms, but to repair to the tonsorial department of the hotel when they will, as in all other departments of the same, be shaved to their satisfaction.

9. Gentlemen are requested not to black their boots in their bedrooms, but to proceed to the S. E. cellar especially devoted to that purpose.

10. Dumb-bells, Indian clubs, swords, sabers, pistols, bows, arrows, boxing gloves, fishing rods, fowling pieces, bats, balls, hammers, saws, chisels and all other tools or implements not allowed inside the building.

11. Lounging on sofas, chairs, chair tilting, placing feet on mantels or furniture of rooms especially forbidden.

12. Dominos, cards, checquers and dice prohibited in bedrooms.

13. Tobacco, jars, jugs, bottles and demijohns not allowed in bedrooms, all intoxicating beverages being furnished at the bar.

14. The use of the windows for astronomical purposes is forbidden; gentlemen desiring to gaze at the moon or the primary planets will repair to the Hilton observatory on the northeast corner of the roof; admission, ten cents.

15. Gentlemen using hair restorers, dyes or pomatum, are requested to wear nightcaps for the preservation of hotel linen.

16. No visiting from room to room allowed without special permission from the Board of Managers.

17. Dogs of every description expressly forbidden in parlors, dining rooms and bedrooms; horses also excluded.

18. Phonographs, telephones, accordeons, violins, flutes, bones and "jews" harps forbidden in the bedrooms. Gentlemen desiring to perform on the bones will proceed to the room devoted to their use. Cornets and bassoons also prohibited.

19. Gentlemen are requested to provide themselves with a regulation full dress before coming to the Hilton Hotel. Persons connected with the militia organizations will please appear in uniform.

20. Gentlemen are requested to wear dressing gowns and slippers in their bedrooms.

21. The management reserve the right to discharge the boarders at their option, with or without cause, should they deem it expedient at any future time to open the hotel as an orphan asylum, zoological garden or museum.

22. Privilege of bath, twenty cents; of the billiard table, two cents a game; other games in proportion.

23. A cheerful compliance with the above rules is requested. The boarders are also expected to pledge themselves to respect any additional rules the management or any employe may lay down for their benefit and that of the proprietor.

24. Boarders must bring at least one large trunk with them, which will be immediately inspected by the Board of Examiners (Christian gentlemen all), who will attend afterward to its proper storage in the hotel storeroom.

25. Gas will be turned off at ten o'clock; all boarders will then retire or be locked out.

The exclusion of women and the residence of Judge Hilton in the hotel, for the benefit of his sex, will, it is hoped, make a happy home for gentlemen, more especially bachelors.

A gentleman will be in attendance to sew on buttons and make repairs.

At the close of a speech by Mrs. SLOCUM, the following pledge was read by MATILDA FLETCHER, amid loud applause:

WOMAN'S PLEDGE.

"The ladies are so much trouble."—Judge Hilton.

Until five years after date we shall not buy anything at Stewart's store, in consequence of the unmanly insinuations regarding the management and failure of the Woman's Hotel, hoping that in that time the managers thereof may better learn the characteristics of American women.

JUNE 3, 1878.

The speaker further announced that a committee had been appointed to distribute the same among the audience. She hoped that the signatures would be counted by the thousands. The next lady introduced was Mrs. DIEHL who read the following resolutions. The reading elicited frequent bursts of applause, the audience in some instances calling for repetitions of particularly pleasing portions.

Resolved, That while we hail with profound gratitude any philanthropy which seeks to better the condition of women, and would gladly offer the meed of praise to that benefactor who truly makes the working women of our land the objects of his benevolence, we have nothing but severe condemnation for those who arouse hope only to cruelly disappoint it, and scorn for him who would add to such an injury a covert sneer and insult calculated to degrade women in the public estimation and demoralize the rising generation.

Resolved, From the array of facts before us and from the oft reiterated assertions of A. T. Stewart to stand a friend of working women, we are firmly convinced that the benevolent intentions of one who, as he himself confessed, owed what he possessed mainly to the patronage of women, have been shamefully thwarted.

Resolved, That we entreat that those whom Providence has blessed with continued life, wealth and a large soul see that their benevolent plans be established beyond the reach of confiscation or the danger of perversion arising from the rapacity of unprincipled persons.

Resolved That in view of the failure of this noble purpose, we entreat Mrs. A. T. Stewart to see that what was intended for working women shall not be taken from them, and that an equivalent charity under better advisers be provided for them as she may in her woman's heart elect.

Resolved, That we exonerate Mrs. Stewart from blame in the administration of this trust, and cannot believe that any generous-hearted woman would have willingly countenanced regulations and restrictions alike insulting to her sex and our civilization, of which one of its chief glories should be the elevation, enfranchisement and protection of women.

Resolved, That the direct personal education of our youth in business probity and practical morals should be one of the chief objects, if not the chief object, of public school instruction, so that instead of producing, as too often is the case, grasping merchants, dishonest lawyers weak-minded legislators and the like, they shall graduate men proud in the consciousness of their rectitude and scorning to do a mean thing.

Resolved, That until the evil genius of sordid gain that presides over Stewart's vast commercial enterprise shows signs of true reform, every self-respecting woman should withdraw her patronage therefrom, and that that which was built up chiefly by women be taken away by women.

Resolved, That equal privileges, equal chances and emoluments in the walks and employments of life for men and women, equal justice in social estimate and administration of law, is what the world demands and values more than the patronizing generosity.

Resolved, That the spirit of avarice and tyranny which denies to a working woman a flower-pot, bird, sewing machine or permission to see father, brother, sister or mother, on the pretense of exact order, but can in a moment throw open smoking and billiard rooms and saloon bars, to pander to the worst vices of men for gain, is only on a par with that bigotry and intolerance which, because of some personal pique, casts odium and insult upon an unoffending, respectable and respected portion of our citizens whose name and history are proudly interwoven with the march of science, government and civilization the world over.

Resolved, That in putting on trial for only two months, under fatal restrictions, what was nine years building, and trumpeted to the world as a magnificent charity; that in obtaining through its brilliant opening, to which women chiefly contributed by their presence and applause, a vast amount of free advertising; that in coolly insulting women and betraying as it by premeditation woman's interest therein, the procurer of this result stands confessed as the most astute business trickster of the day and the most conspicuous fraud in the history of American charities.

Resolved, That however foreign it may seem to this issue and unwarranted in this connection we are still of the sad conviction that that public estimate and legal enactment which class women of the present day among minors, idiots, criminals and Indians not taxed, will not cease to engender a quality of person who, from false elevation to sudden wealth or other base cause, will be likely to subject women to similar taunts unless properly rebuked.

Resolved, That if meetings of the like may seem of no avail in obtaining practical redress, they at least educate a higher moral sentiment, and it is hoped will secure immunity from repetition of a like offence.

WOMAN'S WORK.

GRANDMOTHER.

THE inquiry is frequently heard: What can girls do? One would almost believe that there was a surplus number of girls in the world, and that there was not work enough to employ so many pairs of hands. This is far from being the truth. Though there are many departments that are crowded with applicants, there is in others a great scarcity of help. There is not a town or village but needs nurses for the sick; yet where is there a young lady who is willing to prepare herself for that vocation? Who will devote her energies to fitting herself for such a profession?

It is lucrative and the business is not half so wearing as the shop or sewing machine, and yet the need of good nurses is a serious one. Sick people often really suffer for want of a quiet, kind nurse. Now and then, some old lady is found who will go for a few days to take care of an invalid; but they are not the right kind of people for the business.

The qualifications of a nurse are good health, steady nerves, cheerful disposition, gentle hands, pleasant voice, and courage. These qualifications can be cultivated, and are within the power of all. Then add to these ample observation and practice, and the sum total represents the requisites for a good nurse.

But it is not the work that girls fancy; they are too secluded from society in this occupation. They want to do some great thing—make a stir in life—not stopping to consider how much good they might accomplish, how much suffering they could alleviate in this profession.

Physicians complain bitterly of the lack of competent nurses to take care of their patients. Relatives and friends are too anxious and nervous to make desirable nurses. They are apt by their very solicitude to make matters worse; they cannot control their feelings, and consequently cannot judge as correctly of the condition of the suffering one as a comparative stranger. Besides, the very sympathy they feel and express has an unfavorable influence with the patient.

Care of the sick is pre-eminently woman's work, and many a pair of idle hands might be usefully employed in the sick room, if their owners were disposed to avail themselves of the needs of the suffering; and instead of being useless parlor ornaments, they could become angels of mercy to the afflicted. What can girls do? There is work enough all around them, if they choose to do it; there is no need of their standing all the day idle.

ITEMS FOR CORRESPONDENTS.

BY THE EDITOR.

JOSIE LAUGHTON, Steuben Co., N. Y. I can purchase a tolerably fine straw hat for you as low as 75 cents. A feather with a marabou tip, ornamented with pearl beads, will cost $4. Flowers come at all prices; small one—violets, etc.—can be purchased at 4 cents per dozen; sprays vary according to quality and quantity of flowers used. If you will give me an idea of what you want I will give you prices.

MRS. MADELINE HOUGHTON, Haverstraw, N. Y. You can get fine photographs of fancy subjects—many of them are copies of celebrated paintings—cabinet size, for 25 or 30 cents, and put them in velvet frames, which range in price from 50 cents, and you have a pretty ornament for a bracket or mantel, infinitly preferable to the atrocious daubs so extensively sold through the country.

JOHNNY B—. If you took better care of your feet they would not occasion you any mortification. The feet should be washed every day. The popular notion that frequent washing will make them tender, is a popular fallacy, as any one can very readily ascertain for himself. Wash your feet with warm water and a liberal supply of soap. Allow them to soak a few minutes, then rinse them off with water into which a little aromatic ammonia has been put. The whole operation will not consume ten minutes. Surely seventy minutes a week is a small price to pay to save one's-self from being offensive. Stockings should be changed daily, and the shoes frequently aired.

Domestic Economy.

CONDUCTED BY EMILY MAPLE

HOW TO LAUNDRY BLUE LINEN SUITS. "DOING UP" STRAW HATS.

MARY WAGER-FISHER.

My laundress, last summer, used gum-arabic entirely in starching colored linen suits, making blue linen, which, when starched in the usual manner looks "horrid," have the appearance of being quite fresh and new. And this is the way she did it: Put a tablespoon even full of gum-arabic in a saucer or bowl; pour on warm water, adding more water as the gum dissolves. With her fingers or with a cloth, she dampened the fabric in places not over half a yard square at a time, as she proceeded with the ironing, as the gum starch quickly dries; iron on either side of the goods as is found to be most convenient. A little practice will teach one more "how to do it" than a yard of directions. Of course, the quantity of the gum-arabic required depends upon the amount of surface to be starched. A tablespoonful will stiffen a very great deal.

I also use gum-arabic for stiffening straw hats, which only need to be "pressed over" and not re-shaped. It is economical so to do, and oftentimes a decided convenience. As often as otherwise I use my mucilage-bottle for this purpose, pouring in hot water to thin the mucilage to the required consistency (a few grains of gum added afterwards will make it all right again for other purposes); and with the brush I give the hat a coat of mucilage on the outside. I then lay a pasteboard along the edge of a table, and iron the brim of the hat on the wrong side, the right side being on the pasteboard. Of course, the hat must be turned around as the ironing proceeds. To press the crown I devise various expedients; but as I usually do things in a "jiffy," as the boys say, and without much circumlocution, I often make a large towel or piece of cloth into a bunch, and holding it in the crown with my hand, press it over that. The hat, when done, looks fully as well as if it had been sent to the milliner's; while the cost is about two cents worth of gum-arabic and fifteen minutes of time. This, for black straws; I never tried "my hand" on a white one.

PRESERVATION OF CLOTHES-LINES AND PINS.

We have found that our clothes-pins were rendered more flexible and durable by boiling in clean water from five to ten minutes every two weeks. They should be dried quickly, and kept in strong bags, free from dust. The lines are likewise boiled every month.

When the clothes are dry, the lines are *at once* taken down, tied up and placed in the pantry. By this treatment the clothes are never soiled or stained by the pins, and the lines are less liable to snap asunder, letting the clothes down upon the grass or earth, necessitating re-rinsing and starching.

New Jersey, A. E. M. C.

DOMESTIC RECIPES.

Strawberry Sherbet.

Crush one pound of ripe strawberries, add one pint of cold water, the juice of one lemon, and a tablespoonful of orange-flower water if you have it. Let this mixture stand four hours; then strain through a cloth, pressing out all the juice, and add about one-half pound of powdered sugar; pour into small tumblers, and set into the ice-box for an hour or so before serving.

Currant Jelly.

The currants should be picked before dead-ripe. If they hang long upon the bushes, they lose most of their jelly-making property. Pick from the stems, wash, and place in a porcelain kettle on the back of the stove; stir often, and let remain until thoroughly scalded; strain through a jelly-bag, and make not more than three pints at one time. Allow equal quantities of sugar and juice—a pint for a pint. Boil the juice ten minutes, add the sugar and boil ten minutes longer, skimming as necessary. Put into glasses and set in the sun for a few hours.

Mrs. L. M. W.

Iced Currants.

Take large bunches of currants, wash and drain dry; beat the whites of one or two eggs to a froth; dip in the bunches of currants and place them upon an inverted sieve, so that they do not touch each other; sift powdered sugar thickly over them and place where it is warm until dry.

Graham Gems.

Three teacupfuls of sour milk with a little cream; one and a-half teaspoonful—scant—of soda; one well-beaten egg and a teaspoonful of salt; a tablespoonful of molasses or sugar; a tablespoonful of melted butter and Graham flour to mix. To the egg add the milk, then the sugar and salt, then the flour with the soda mixed in, the butter last; beat the mixture well; have the gem-pans very hot, grease, fill with the batter, which should be stiff enough to drop, not pour from the spoon, and bake from fifteen to twenty minutes in a hot oven.

Mrs. E. L. L.

Buns.

One cup of sweet milk; one beaten egg: one-half cup of butter; one cup of sugar; one-half cup of yeast; a little salt and flour enough to make a soft dough. Let rise until very light and mold into long biscuit with a few currants; let rise again in the pan; then bake and when almost done glaze with a little molasses and milk.

Mrs. Mary Willson.

Cuba.

QUERIES ANSWERED.

Please tell me the easiest method of cleaning and polishing brass stair rods?

Mrs. W. B. P.

Ans.—Take equal parts of soft soap and rotten-stone; beat to a paste and apply with a woolen cloth; or use rotten-stone made into a paste with sweet oil; polishing in either case with whitening and soft leather.

Acids are sometimes employed the use of which however, causes the brass to soon tarnish, and consequently the rods require more frequent cleaning.

Wanted.—Something to remove stains from mourning dresses and crape?

Mrs. P. Baker.

Ans.—We have been advised to boil a handful of fig leaves in three pints of water until reduced to one pint; squeeze out the leaves strain the water, bottle and keep for use; apply with a sponge.

G. H.—Ink stains may be removed from marble by washing first with clear water and then with a weak solution of oxalic acid.

News of the Week.

May 10th, 1878.

POLITICAL.

The Congressional investigation into alleged electoral frauds in Louisana still remains the chief political subject of interest. Anderson's testimony is for the present concluded, though he will be recalled to the witness' stand later on and examined by Gen. Butler. His story, in brief, is substantially that the election in East Feliciana was fair; that no Democratic intimidation was practiced there, despite the fact that not a single vote was cast for any Republican candidate in a parish which had given a Republican majority of 1,020 in the Presidential election of 1872, and one of 841 in the State election of 1874, and which had on its books 2,127 registered Republican votes in 1876. For this strange fact he accounts by saying that the Republicans had formed a conspiracy to prevent the casting of any Republican votes as a basis for the rejection of the entire vote of the parish by the State Returning Board. On his visit to New Orleans after the election he was urged by the Republican leaders, as the supervisor of registration in the parish, to enter a protest against the returns. This he did, leaving here and there blanks, which were afterwards filled up by others with such figures as were thought necessary to insure the rejection of the vote of the parish. After this had been done, he had an interview with Messrs. John Sherman and Stanley Matthews, who urged him to stick to the fraud, promised that he and a fellow conspirator named Weber, supervisor of registration in West Feliciana, who has since been murdered there, would be well provided for by Hayes after the 4th of March. In order to get a hold on Sherman, he adroitly drew from him a short letter telling him to stand firm in the position he had taken, and that neither Mr. Hayes nor himself would ever forget the obligations under which he had placed them.

A copy of the letter was produced, and Sherman, having been summoned, said that he believed he never wrote such a letter; that he had no recollection of having done so, yet that it contained some things which he would have written on his understanding of the case at the time. This qualified denial has injured Sherman considerably, owing to his previous bold assertion that no such letter was ever written, although the Republicans say that the document, if genuine, would not be criminating, as Sherman was at the time under the impression that Anderson's protest of democratic violence was well founded, that his life would be endangered by his courageous conduct in making it, and that it would be only just therefore that he should be well treated by the party in whose behalf he had risked so much. Anderson says that afterwards Sherman never tried in any way to conciliate him, and peremptorily refused to push his claim for office in any department of the Government. Sherman has written a letter to Potter saying that he is able to show that Republican voters *were* intimidated in East Feliciana, and demanding that subpœnas should be sent to from 50 to 100 specified witnesses who can prove his assertion.

In order, as he confesses, to get Nash, Congressman for his district and candidate for re-election, so implicated that he could not "go back" on him, Anderson, before entering his protest, induced the guileless legislator to sign an agreement that he would secure the trickster the position of naval officer at New Orleans, in consideration of a promise that the latter would suppress evidence showing that East Feliciana was fairly carried by the democratic party. Original letters and copies of others put in evidence show that Senator Stanley Mathews has been persistently working hard to get Anderson a governmental appointment acceptable to him, yet a note of his tells the importunate and often impudent office-seeker that he can tell Nash that he, the Senator, is in possession of this disgraceful agreement. The general opinion seems to be that the correspondence has ruined Mathews. He has earnestly protested his innocence, however, in the Senate, and at his request, a committee of that body has been appointed to investigate his connection with the Louisiana complication. He has declined to appear to testify before the House committee, on the ground that the Senate had taken the matter in hand; but on the motion of Gen. Butler a subpœna has been issued to compel him to do so. Anderson freely owns that, though under oath, he deliberately deceived the Senate committee sent to New Orleans for investigating purposes shortly after the election; that he was in treaty with Burke and other Louisiana democrats, with a view to favor their party for money; that he has been persistently trying to blackmail the administration; that Hayes bruskly declined to hear his complaints, and that his present evidence is the result of his failure to receive a sufficiently satisfactory reward for his acknowledged rascality.

The next witness examined was Judge Levissee of New Orleans, Republican Elector during the Presidential contest. He created a sensation by testifying that his signature had been forged to one set of Louisiana electoral certificates. On the receipt in Washington of the electoral returns from that State, the package did not have on the outside the signatures of the electors, a formality considered constitutionally necessary. To remedy this defect, the envelope was sent back to New Orleans by the hands of the authorized messenger who had brought it—"Returning Board" Anderson. On its arrival there Levissee was absent from the city. The package, however, was opened, a new set of certificates made out, to which the other Electors put their names, while that of the absent member of the Electoral College was forged by somebody. On the original certificate the votes for President and Vice-President appeared together by mistake, contrary to the constitutional requirement. In the new returns the error was corrected, necessitating the signature of each Elector in nine places, and Levissee's name was forged in each place; yet it was on this certificate that Hayes was declared elected. Errors more or less similar were made with regard to the returns from several other States; but in making the necessary corrections, the only forgery committed was in Louisiana. There is no doubt but that the Republican Electors cast the vote of the State for Hayes and Wheeler; the fault in this case was the forgery of the name of a man who would have signed the documents readily had he been present, but who could not be reached in time enough so that the papers, properly authenticated, would arrive in Washington by the date required by the law. Lovisee also testified that he had been offered a bribe of $40,000 to cast his vote for Tilden by a man whom he afterwards discovered to be the agent of some gamblers who had heavy bets on the election. Isn't it about time that some law should be passed changing the present Presidential electoral system, so as to avoid the possibility of rascals in office defeating the will of the people by dishonest manipulation of the votes, or of rascals out of office tempting frail officials to effect the same object by betraying the trust confided to their honor?

On Friday Senator Spencer of Alabama introduced a resolution for the appointment of a committee of eight Senators to inquire into all matters connected with the Presidential election of 1876 in the States of Louisiana, Florida, South Carolina, Alabama, Mississippi, Oregon and any other State it may deem proper; also to inquire into any bargain which may have led to the overthrow of the Packard and Chamberlain governments in Louisiana and South Carolina, respectively. Spencer and Conkling are fast friends, and this move is said to be a joint affair that may hurt administrationists and democrats, while the latter claim that it is made to divert attention from the action of the House investigating committee. The Senate has refused to cut down the army to 20,000, as proposed in the House bill; but it has agreed that soldiers shall not be used as a *posse comitatus* for the purpose of executing the laws, except in such cases as the employment of the force may be authorized by the Constitution or by act of Congress. This will prevent the use or the army in election troubles, as formerly in Louisiana and other Southern States. As anticipated here last week, the President has signed the bill prohibiting the further retirement of greenbacks, and directing the reissue of redeemed notes by the Treasury. There is some talk East here of testing the legality of this measure before the Supreme Court.

The House investigating sub-committee are taking evidence at Jacksonville, Fla., with regard to alleged electoral frauds in that State. Baker County is said to have been thrown out to secure a Republican majority. Democrats say the revelations are highly important; an assertion Republicans stoutly deny.

The Senate has refused to agree with the House in its desire to transfer the Indian Bureau from the Interior to the War Department. Ex-Governor Noyes of Ohio is on his way home to testify as a "visiting statesman." Oregon is said to have elected a democratic Legislature which will, in turn, elect a democrat to the Senate. Hamlin of Maine tried to re-establish the franking privilege by a bill introduced in the Senate—vote even, measure therefore lost. In an interview with a newspaper correspondent on the field of Gettysburg, on Decoration Day, President Hayes declared that he considered any attempt to remove him from the Presidency revolutionary and would feel in duty bound to resist it. The general opinion of the country, however, seems to be that his title to the Presidency must not be called in question whatever may be the result of this investigation, and in this opinion even Mr. Hendricks, while favoring the investigation, concurs.

MISCELLANEOUS.

Gen. Spinner, he of the eccentric signature, is in Florida, raising all kinds of vegetables, fruits and trees that will thrive there, and is especially jubilant at the prospect of being able to drink and perhaps sell tea of his own cultivation. Those unpleasant stories about the costly jetties just built by Eads at the mouth of the Mississippi, are, it is to be hoped, unfounded. James Gordon Bennett, lately of Bennett-May duel celebrity, who has been in Europe since the occurrence, writes that he will come home to take the legal consequences, by the middle of July. The latest invention of Edison, the marvelous inventive genius of the nineteenth century and Menlo Park, N. J., is the Megaphone, a sort of sound opera-glass or telephone, which indefinitely increases the volume of sound and is therefore a handy boon to folks partially deaf, as well as to eavesdroppers. By it the footfall of a fly, it is said, can be heard as plainly as the gallop of a horse on a hard road. The emigration of freedmen from the Carolinas to Liberia is still gaining headway, chiefly under the direction of a philanthropico- speculative colonization company with headquarters in Philadelphia.

There is a strong probability of another Indian war this summer: the Bannock Indians are out in the Lava Beds rendered notorious by Capt. Jack and his Modocs, some years ago, Spotted Tail's 5,000 followers are also discontented at broken government promises, and the "braves" threaten to go on the war-path. Sitting Bull is urging the Sioux and kindred tribes to arms, and breathing vengeance against his present hosts in Canada; our troops are concentrating on the strongest points, and on those from which offensive movements would be most effective; border farmers and settlers are growing uneasy; and border speculators and desperadoes becoming jubilant. These Indian troubles have grown slightly chronic, and apprehensions of them severely so. The Silver Mountain Mining Company is the latest extensive fraud for swindling the unwary. The affair levies assessments on shares which are reported to be on the books credited to the proposed victim, promises enormous profits, and when the payment of assessments is refused, no more is heard of the Company. Miners in West Virginia are becoming riotous rather early this year. On Tuesday a party of them captured a steamboat near Charleston, went on it to Blacksburg, where they forcibly stopped the miners, then captured a railroad train, on which they returned home, forcing it to stop wherever they wished, and scouting the notion of paying fare.

Mr. Tilden's income tax suit has been deferred until another term of the Court. On motion of Senator Thurman, an auditor has been appointed to look after the accounts of the Pacific railroads. As the Government has millions invested in these roads, it's only right that it should know just how they stand. The filibustering Lerdist movement in Mexico is reported to have proved a failure; the invaders have taken to the mountains; and are hotly pursued. Great alterations are being made at Camp's great ship-building yard, at Chester, near Philadelphia, in three fast steamers purchased for war purposes by Russia. There are labor strikes and violence in Quebec, and Orange riots in Montreal. Crops in various parts of Massachusetts and New Hampshire were damaged by heavy frosts on Friday night. The Board of Alderman of this city has been indicted for misdemeanor in granting permits to hucksters allowing them to erect stalls on the side-walks. So has the Board of Health for not abating the nuisances created by fat-rendering factories and similar malodorous establishments. Both trials come off this week. Gen. Fremont has been nominated by the President, for governor of Arizona to take the place of Jno. P. Hyot, who has been transferred to the governorship of Idaho, on the removal of Mason Brayman, who is bitterly charged by the settlers with having given, to the Indians now on the war-path, permits to purchase the arms and ammunition with which they are said to be liberally supplied. Several other very respectable men, in different parts of the country, some curled and perfumed young pets of society, and others gray-haired specimens of venerated sanctimony, have yielded to satanic influence and been by discovery transformed into hypocritical scoundrels who have embezzled funds confided to their charge.

FOREIGN.

The Emperor of Germany is reported to be out of danger from the effects of the late attempt to assassinate him. So precarious was his condition towards the middle of the week, that after some hesitation it was deemed best that the Crown Prince should be appointed regent to discharge the duties of the head of the State, and by Bismarck's advice the appointment has been made. It is not improbable that the Emperor will either resign or refrain in future from taking any personal part in the Government. Nobeling, the would-be assassin, is still in a dangerous condition from his self-inflicted injuries, despite the best efforts of the doctors to save him for the hangman. It seems that in the socialistic conspiracy he was selected by lot to do the murder; and it is said that the Crown Prince and Bismarck were also in danger.

As predicted here last week, the liberal party in the Reichstag has already declared they will no longer oppose the enactment of prompt measures for suppressing socialism. The Pope also has written to Teutonic Roman Catholics urging a vigorous opposition to these revolutionists. A number of them who expressed joy at the dastardly outrage on the Emperor have been arrested and promptly condemned to imprisonment for from one to five years. The Nihilists in Russia are also again becoming trou-

biesome, having assassinated several prominent officials and wounded others. Altogether this communistic movement in various forms is causing extreme disquietude to monarchical Europe and making all parties the readier to accept moderate terms of peace at the approaching Congress. This will begin at Berlin on the 13th and the various diplomats who will take part in it are already on their way to that point. There are a host of newspaper conjectures with regard to the terms to be demanded by each party, but very little reliable news on the matter, and it is safe, therefore to stifle any curiosity in this connection until next week, by which time authentic details will probably be accessible. The earliest notice of these shall be given here. HERMAN.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, June 8, 1878.

BEANS AND PEAS.—The scarcity of and advance in old potatoes adds something to the local demand for medium beans and prices for choice are strong, in fact higher than for marrows, which usually lead quotations for standard beans. Export sales of marrows add up to some extent, but the demand is not of a solid character and holders seem disposed to favor buyers. Pea beans quoted full for the quality here. White kidneys quiet and unchanged. Red kidneys not a wholesale stock. Black beans held with some confidence. Canadian field peas quiet and quoted easy; 78@80c. Green peas steady without large business; $1 05@1 10. B. E. peas scarce at $3 00@3 25.

We quote medium beans, prime, $1 60@1 62; fair to good, $1 40@1 60; marrows, prime, free on board ship, $1 60; fair to good, $1 45@1 60; Pea, $1 40@1 65; white kidney, $1 50@1 65; red do., $2 50@2 90; black, $2 35@2 40.

Receipts of beans past week, 4,600 bush. Exports of beans, 750 bbls.

BUTTER.—It is impossible for New York to use up the steady large supplies that arrive, and were not prices so favorable for consumers, dealers would be sadly puzzled as to the disposal of the heavy bulk. As at our last, grades at all off in table merit are pushed aside or sent to cold store rooms. This mainly occurs with western low grade factory or milled stock. It is difficult to predict what will be the future of poor grades; exporters are usually a last resource; but at present that class of buyers have access to lines of stock usually far above their price limit, and in many instances are sending butter abroad quite equal to that offering for home use. This introduction may eventually make an outlet for America's large and growing yield and farmers who are caught in the low-priced current of the present must content themselves with the possibility of drifting into a profitable commercial hereafter. This may not be a very cheering suggestion when this hard-earned dairy product is quoted 20c. per pound and under; but it is better than most of the blue stories that dealers greet us with. It is certainly a perplexing situation when merchants don't like to encourage shipments and dare not advise owners to hold back supplies. Near-by pails are improving in quality and begin to recall more of their customary summer city trade. Creamery is plenty, demand well divided between Western and State. Western dairy butter when in good retailing order sells readily, but rather than risk the chance of a false purchase in factory or milled, a good many grocers prefer to pay the slight difference for sound sweet State when reliable Western dairy is not to be had.

Receipts for the week, 36,700 pkgs.; exports past week, 11,811 do.

State creamery, choice, 18@19c.; other, 16@17c.; half tubs and pails, choice, 17c.; other, 12@15c.; Welsh tubs, best, 15@16c.; other, 13@14c.; poor State, 8@10c.; State firkins, 15@17c.; Western creamery, choice, 18@19c.; other, 16@18c.; Western dairy, best, 12@14c.; other, 9@10c.; factory (ladle packed), 10@10¼c.; other, 9@10c.; milled Western, 6@8½c.; old and grease, 3¼@5c.

Comparative receipts and exports from June 1st.

	Receipts, pkgs.	Exports, firks.
June 1, '77, to June 1, '78...	1,293,065	186,208
June 1, '76, to June 1, '77...	1,272,202	155,531
June 1, '75, to June 1, '76...	1,187,827	35,130
June 1, '74, to June 1, '75...	1,018,432	53,366
June 1, '73, to June 1, '74...	996,201	33,586
June 1, '72, to June 1, '73...	741,813	49,113

BROOM CORN.—Slight changes are made in prices to conform to the moderate business.

Quoted 6@7c. for hurl and short brush; 5@6c. for medium green, and 4@4½c. for red and red tipped, per lb.

BEESWAX.—Is offered easy, with a better supply. Sales at 26¼@27¼c. for Western and Southern.

Exports, past week, 1,396.

CHEESE.—The shipments for the week have been fully 98,800 boxes. With the demoralization of last week factorymen were more cautious shippers, and the receipts here have shown a decided falling off. A good many lots also showed inferior quality, and this was the case as well with a number of usual standard factories, on account of the rainy weather of the previous week, leaving but comparatively moderate offerings of really fancy prices. Shippers have wanted these choice lots, and the price has been carried up a trifle daily, closing with 8½ easily made, or a gain of one-half for the week. Towards the close of the week the good grades had increased attention.

Quotations are, for fancy, 8c.; 7@8c. for good and prime; 6@6½c. for fair; 4@6c. for half skimmed, and 2@3c. for skimmed. State, farm dairy at 6¼@7½c. for good to choice, 5@6c. for fair to good and 2@3c. for poor skimmed. Western factury fine, flat at 7½c.; do. good to prime, 5½@6½c.; do. fair, 4@5c. Wisconsin factory, fancy, 8@8½c; do. good and prime, 6¾@7¾c.; do. fair, 5¼@6c.

Receipts for the week, 98,773 boxes.

Exports, past week 79,650 boxes.

Gold closes at 101.

Liverpool cable quotation, 47.

COMPARATIVE RECEIPTS AND EXPORTS FROM JUNE 1ST.

	Receipts, pkgs.	Exports, lbs.
June 1, '77 to June 1, '78.....	2,675,032	117,452,460
June 1, '76 to June 1, '77.....	2,119,830	91,345,320
June 1, '75 to June 1, '76.....	2,447,849	99,259,799
June 1, '74 to June 1, '75.....	2,044,579	100,026,701
June 1, '73 to June 1, '74.....	1,962,901	90,053,247
June 1, '72 to June 1, '73.....	1,761,221	79,139,980

COTTON.—A considerable business has been done in spot lots, and the general market is stronger. Latest prices are for June, 11.58@11.59c.; July, 11.61@11.62c.; August, 11.65c.; September, 11.38@11.39c.; October, 11.18@11.19c.; November, 10.05@10.07.; December, 11.06@11.08c.; January, 11.03@11.11.; February, 11.16@11.20c.; March, 11.27@11.29c; April, 11.37@11.39c.; and May, 11.44@11.47c.

Quotations for export cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted:

Good ordinary,...9¾c.; Strict good ordinary.....9¾c.
Low middling.....10¾c.; Middling .....10¾c.

DRIED FRUITS.—Apples are hard to sell, although they are offered lower. Peaches move off slowly, and small fruits generally steady and quiet.

Peaches—Fancy North Carolina 11@12c.; Choice Georgia, 10@11c.; good to prime Georgia; 8@10c.; evaporated, 25@28c.; unpeeled halves, 3¾@4½c.; quarters, 3¾@4c.; unpeeled evaporated, 7½@8c. Pitted cherries, choice new, 19@20c.; Raspberries, 27c. New York State plums, 11@12; Southern plums, 8@10c. Blackberries at 10½c. Apples—State quarters, 4½@4¾c.; do sliced, prime, 6c.; good, 4@4½c.; Western quarters, 2½@3c.; Southern at 5c. for prime sliced; 3½@4½c. for fair to good; Southern quarters, 3@4c.; Tennessee quarters, in bags, at 2½@3.

Exports for the week, 1,088 bbls. dried apples.

EGGS.—Receipts for the week, 6,720 bbls.; do last week, 10,174 do. The market is in good working condition, prices are better, but the advance is a wholesome one, and closing rates are not exhorbitant for the season. We quote lots Western N. J. extra, 16@17c.; State and Penn., 15@15½c.; Western and Canadian, fresh, 14@15½c.; poor stock, 14@14½c.

FRESH FRUITS.—Apples now omitted from the list. New Jersey and Hudson River gardens furnish the principal supply of strawberries. The growth in N. J. is thinner than for many former seasons. Several lots of mammoth seedlings have been in during the week, among which are to be noted: well-ripened Monarch of the West, Duncans, Downings, Jocundas, Great American and Glossy Cones. Some were fancy enough to bring 25c. 30c. 50c. and even 60c. per quart by the crate—very complimentary rates for growers, especially considering the state of times. Up River 3ds 3½@4½c. fair to good N. J. crates, 6@10c.; remnant of Southern, 4@5c. Cherries, fine, 10@12c.; good, 6@8c.; small, 4@5c.; sour cherries, 7@9c. Blackberries dull at N. C. and Md., 10@15c. quart. Peaches are coming from South Carolina and rather check the sales of Georgia, being better sized. Quality of either not much to speak of. Char., $2@2.50 bush.; Georgia, $2.50@4. Peanuts have had a southern advance, and sellers here have marked up rates; business continues light. Virginia handpicked, $1.40@1.50; fancy, $1.30@1.35; common to good, 90c.@1.25. Hot-house peaches, doz. $2@3. Black Hamburg Grapes, ℔ $1@1.25.

FLOUR.—The receipts have fallen off and in sympathy with wheat prices are rather stronger. Latest sales are at $3.30@4.15 for very inferior to fancy superfine State; $4.20@4.45 for poor to good extra do. odd lots and lines; $4.45@4.65 for good to fancy do.; $3.25@4.15 for very poor to fancy superfine, Indiana, Iowa, Michigan, Ohio, &c., $4.20@4.45 for very inferior to good shipping extra do., and $4.45@5.65 for good to fancy extra do.; common to about choice white wheat extras, $4.50@5.65; choice to very fancy do. at $5.65@6.75; red and amber winter wheat, inferior to very choice trade and family at $4.50@5.85; round hoop Ohio at $4.25@$4.60, and trade and family brands of do. at $4.70@5.75, the latter rate for choice, (fancy lots quoted higher); St. Louis, $4.40@5.25 for very poor to good extra, and $5.25@6.50 for good to very choice, with a few brands of fancy quality quoted up to $7.00; Minnesota clear, very inferior to very fancy choice at $4.35@5.75; Minnesota "straight," inferior to fancy, at $5.35@6.50, and patent poor to fancy at $5.40@8.00; unsound stock at from $2.00@5.00; city mill extra at $5.40@5.65 for fair to fancy for West Indies; do. for England, $4.25@4.35; do. trade and family extras, $6.00@7.25; do. for South America, $5.75@6.50 for fair to choice; No. 2 at $3.25@3.25 for inferior to very fancy.

GRAIN.—The receipts have been light, the movement at the lake ports of a more limited character, and resumption of important export demand has caused an advance in wheat and corn.

Latest sales of No. 1 red at $1.15; No. 2 white, $1 19; No. 1 white at $1.24; white State at $1.29; further bid; 17,500 bushels No. 2 red at $1 15@1 17; red southern at $1 14; ungraded red at $1.15@1.15½; ungraded Canada, in bond, at 1 10; No. 2. Northwest and Milwaukee spring at $1.11½@1 12; No. 2 Chicago spring at $1 11½; New York No. 2 spring, at $1 11; do. June option at $1 11½; do., last ten days in June, at $1 11½; do., July option, at $1 10½; No. 2 northwest spring, June option, at $1 12; do., special deliveries in June, at $1 12½; do July at $1.10¾; No. 2 red June option at $1 16. Rye at 64@65c. for State and 64c. for Western; Kansas mixed at 46¾@46½c.; New York No. 2 at 45¾@46¼c.; New York No. 3 at 41¾@43c.; ungraded mixed at 41½@45½c. New York No. 2 white at 53@53c.; New York steamer mixed at 42¾@43½c, and ungraded steamer sold up to 44¾c.; Southern yellow, at 47c.; No. 2 June option at 45¾@46c.; No. 2 July option, at 47¾@48¾c.; No 2 August at 48½c.; steamer mixed, June option, at 42½@43c.; do. July option, at 44¾c.; August at 46c. Oats at for New York No. 1 white at 35½c.; New York No. 2 white at 30@31½c.; New York No. 1 at 31c.; do. last half June and first half July at 31@31½c.; do., July delivery, at 31c.; New York No. 2 at 29½c.; white western at 29½@33c.; mixed western at 27@31½c.; No. 2 Chicago at 30½@31c; No. 2 Milwaukee, at 31c.; white State at 30@33c.; mixed State at 27½@30c.; New York extra white quoted at 33c.; New York No. 3 white at 29@29½c.; New York extra at 32c.; New York No. 3 at 28½@29c.

HAY AND STRAW.—The receipts are fair, demand only moderate and prices easy. The indifference of buyers is caused by the feeling that there are pretty full supplies of the old crop back in the interior and the reports that the new crop is two to three weeks ahead in the more important sections.

Bale hay, 50@55c. for shipping, and 65@75c. for retail qualities; clover, at 45@55c. for prime. Straw quoted at 40@45c. for long rye; 35@40c. for short rye, and 40c. for oat.

Exports, past week, 1,700 bales; since Jan. 1st 29,600 do.; same time last year, 26,060 do.

HOPS.—Exports for the week, 360 bales. With less favorable crop reports the market is somewhat stronger. The business, however, has fallen off this week, and the receipts have increased.

New Yorks, good to prime, 7@10c.; do., low and fair, 5@7c.; Eastern, new, 5@8c.; Wisconsin, do. 5@8c.; Yearlings, 2@3c.; Olds, all growths, 1@2c.

LEATHER.—Quotations are 19@20c. for light; 19½@21c. for middle; 20@21c. for heavy, and 17½@19c. for good damaged.

MISCELLANEOUS.—American essential oils; Peppermint, in tin, $1 70@2; in glass, $2. Wintergreen, $1 90@2; Sassafras, 39@40c. currency; Seneca root, 53@55c. Ginseng, $1 10@1 20. Feathers, choice geese, 45c.; mixed, 40@42c.; scalded, 35c; duck, 20c.

OIL-CAKE.—Western is quoted at $30 00@30 50 per ton.

PROVISIONS—Are generally higher on an active trade.

Mess pork quoted $10@10 25 for spot lots; $10 05 for July; $10 20 for August, and $10 35 for September. Bacon at 5c for long clear and 5½c. for short clear. Lard—Western steam at 7 05 for spot lots, 7 for June, 7 02½@7 05 for July, and 7 10 for August. Stearine at 7¾c. for Western. Tallow at 7 1-16c. Neat hams at $20@21. Beef—For extra mess, $11 75@12; plain mess, $10@11.50; packet, $13.00@13.50 for bbls.; extra India mess, $20@22 for city brands; do. Philadelphia, $19@20.

POULTRY AND GAME.—German and Jewish holidays gave some life to the live poultry market, and for the moment prices are better for fowls and chickens. Turkeys scarcely inquired for.

Fowls.—Near points; 10@11c.; Southern and Western, 9@10c.; Spring Chickens, N. J., 20@22c.; Western, 18@19c.; Turkeys, 8@10c.; Choice, Ducks, pair, 62@75c.; Southern and Western, 40@60c.; N. J. Geese, $1.25@1.50; other, $1.00c.@$1.12.

Dressed poultry low even for warm weather. Turkeys, good to prime N. J. and Penn., 11@13c.; other, 9@10c.; Spring chickens, pair 24@27c.; Western, 18@20c.; N. J., 20@22c.; Phila. fowls, 12@13c.; State and N. J. 10@11c.

The game market is reduced to pigeons; Stall-fed per dozen, $1@$1.25; flight do, 65@70c; wild Squab, 50@60c.; tame, $2.

SALT.—Quoted at $2 50 for Ashton's; $1 10@1 25 for other brands except Folks and Buckley's, which are quoted $1 00@1 10.

SUGAR.—Refined at 9¾ for cut loaf, 9¾ for crushed, and powdered, 9¾ for granulated, 8¼@9¼ for soft white and 7¾@8¼ for soft yellow.

VEGETABLES.—Old potatoes do not hold their late advance, new having arrived heavily and dropped to very popular prices. Best old, $2@2.25; under grades, $1.25@1.50; Bermuda, $3.50@4; Fla., Nor. and Char., $1.75@2.25; Nor. and Md., $1.50@2; culls, $1. Ber. Onions crate, 75c.@$1; do. tomatoes, 40@50c.; Fla. do. crate, $1.50@2; Char. do., $1@2; L. I. Green Peas 2 bush. bag, $1.25@1.50; N. J. Marrowfat bbl., $2.50@3; Md. do., $2.50@2.75; do. small, $1.50@2; Nor. $1.50. String beans, half bbl., $1.75@2; crate, 75c.@$1.25. Cucumbers, 50c.@1; do. squash, half bbl., $1@1.25. Asparagus, Oyster Bay, $1.75@2; N. J., 75c.@1.25. Radishes, 100 bunches, 50c.@1; Rhubarb do., $1.50@2; N. J. Beets, do., $2@3; Nor. do., $2; Spinach, bbl., 50c.; Lettuce, 25@75c.; Cabbages, Nor., bbl., $1@1.50; Turnips, N. J., 100 bunches, $3@5; Carrots, bbl., $1@5; Hot-house Cauliflower, $1.50@3; Mushrooms, lb., 30@50.

TOBACCO.—The new crop is arriving freely, but demand continues good, and prices are strong and unchanged.

LIVE STOCK MARKETS.

NEW YORK, JUNE 8, 1878.

BEEVES.—Receipts for the week, 11,780 head; do. last week, 10,337 do. The offering for the closing day was large and buyers hung back in expectation of concessions. Sellers finally submitted, but the yards were cleared late. Quality did not run as fine as in the recent past, and selections brought ½c. more than similar grades on Wednesday. Texas, Cherokee and Colorado cattle part still-fed, sold at 7¾@9¾c. to dress 56 lbs. Ordinary to best native ranged from 8¾ to 10¾c., very small bunches at the latter price. Export trade was good with favorable reports from England on American beef and cattle.

COWS AND CALVES.—Receipts are unimportant, but there is no market to warrant steady supplies. Prices range as before, but even best cows have to risk a chance sale. Nominal rates $40@60 and $65.

VEAL CALVES.—The market has advanced for all grades during the past three days. Good, useful buttermilk calves sold at Sixtieth-st. 4@4½c.; near by buttermilk, such as go to West Washington market, 3@3½c.; full milk calves 5¾@7c. for ordinary to prime N. J.

SHEEP AND LAMBS.—Receipts for the week 25,590 head; receipts last week 19,753 head. Sheep are dull and low; very common to best 3¾@4¾c. Since lambs have declined the market has become very active. Va. and Ky. 5¾@7c. Ohio, Delaware and N. J. 7@8c.

SWINE.—Receipts for the week 26,806 head; do. last week 32,285 do. Market dull but with free supplies for summer. Killers will not bid above $5.50@5.65 for fair to good corn-fed.

New Advertisements.

Sure Death to the Potato Beetle.

The Union Mills Bug Destroyer

Contains Paris Green and other poisonous ingredients, mixed ready for instant use, and is guaranteed to effect a speedy and sure deliverance from the ravages of the Potato Beetle,

Directions for using and a good hand sieve for applying the poison with each barrel.

Price $5 per bbl., delivered on cars. Satisfaction guaranteed or money refunded. Address

JOHN RALSTON, 170 Front St., New York.

Use the Anti-Friction Hay Carrier.

For elevating and conveying Hay, Grain, etc., in barn, barrack, shed or field. It elevates perpendicularly and conveys horizontally any desired distance. No trouble about getting over high beams and to the end of deep mows or to the top of high stacks. Thousands are now in use. Five tons have been stacked and the frame moved in forty-five consecutive minutes. Fifty tons have been stacked in a single day with this Frame and Carrier. SEND STAMP FOR CIRCULAR "5" to U. S. WIND ENGINE & PUMP CO., BATAVIA, ILL.

BEST and CHEAPEST.

Buchan's Cresylic Sheep Dip prevents and cures the scab and all parasitic diseases of the skin.

Buchan's Cresylic Ointment is CERTAIN DEATH to the Screw-worm or Grub.

For further particulars, send for Price Lists and Circulars to

KIDDER & LAIRD, 83 John St., New York.

KILL

The POTATO BUGS

AND SAVE THE POTATOES.

SURE DEATH to the Colorado Potato Bug is only to be had by the use of Paris Green. Prof. Cook and others say that all other remedies have failed. ENDORSED BY A. S. FULLER, AGRICULTURAL EDITOR OF THE "SUN."

PURE PARIS GREEN

Made by F. W. Devoe & Co., can be relied on for the extermination of the Potato Bug and Cotton Worm. Circular on the use of Paris Green distributed free on application.

F. W. DEVOE & CO'S

MIXED PAINTS.

For the convenience and economy of consumers of PAINT the well-known house of F. W. DEVOE & CO. now prepare

PAINTS READY FOR USE

FOR FARMERS and MANUFACTURERS.

They are uniform in shade, and the colors can always be matched. Any one can paint with them. No need of a painter to mix it for you. No need of a dryer or other ingredients. The paint is ready for immediate application. Send for sample cards showing different shades. They have very superior covering properties and do not, like the so called patent paints, contain either water, benzine or alkali. These Paints are in Liquid Form, and are sold in Gallon Cans and Barrels. They are also put up in small cans of one to five pounds.

F. W. DEVOE & CO.,

Manufacturers and Importers of Colors, White Leads, Zinc White, Varnishes and Artists' Materials, CORNER FULTON AND WILLIAM STS. (OLD DUTCH CHURCH CORNER), NEW YORK CITY.

HOW TO BE YOUR OWN LAWYER

AGENTS WANTED. $50 TO $175 A MONTH. Send for Circular & Terms. P. W. ZIEGLER & CO. Philadelphia, Pa.

$1 FOR 25 CTS.

Seven new and wonderful articles at one-fourth the retail price. Examine the list.

No. 1. Musical Pipe.—Made of metal, with bowl resembling a human face. By filling with water, will imitate perfectly the notes of any bird.

No. 2. Miniature Charm.—Suitable for necklace or watch chain. Size of gold dollar, yet has all of Lord's Prayer clearly engraved on it. New and beautiful.

No. 3. Eureka Whistle. Loudest and clearest whistle made. Very useful for sportsmen to exchange signals.

No. 4. Japanese Parasol. Just imported, Prettiest Infant novelty in the market. Splendid gift to a lady.

No. 5. Magic Spider. Funniest thing out. A horrible looking fellow, sure to make people jump out of their boots. Always creates an excitement.

No. 6. Musical Wonder. A new reed instrument, on which any tune may be played, or sound imitated, from the waul of a cat to a Punch and Judy show.

No. 7. Golden Water-Pen. Produces clear, golden letters, by simply dipping in water. Lasts for months.

The above seven articles are shown in cuts, and will be sent in neat cabinet, post paid, for 25 cts. At retail they would cost $1. We make this reduction to obtain new names for our Fall Catalogues. Postage stamps taken same as cash. Address,

Eureka Trick & Novelty Co.,
P. O. Box 4614. 39 Ann St., N. Y.

LADIES IF YOU WISH TO COLOR—

Use Leamon's Dyes.

Warranted the best and cheapest Dyes for all family and fancy dyeing. Dresses, Cloaks, Coats, Ribbons, Ties, Feathers, anything, can be colored any shade. Anyone can use them. The expense is trifling. We especially recommend the Black as much better than logwood. Sold by druggists, or any color sent by Mail, large size, 25c., small size 15c. Send for Dye Book and beautiful Samples, Free.

WELLS, RICHARDSON & CO., Prop's, Burlington, Vt.

Reading for the Young.

"POCKET-MONEY FOR THE YOUNG PEOPLE."—No. 6.

CORNPLANTER.

The production for market of the more common vegetables is in many localities quite profitable. Where facilities for marketing are convenient, Lettuce, Radishes, Peas, Snap-Beans and Early Beets for greens are grown with but little labor. I have found the Early Egg-lettuce for early, and Malta Drumhead and Hanson for late, the best. Sow in drills, thinning four to six inches, utilizing the thinnings for market, tied up in bunches, or for transplanting: Radishes, French Breakfast for early, and Long Scarlet for summer; sown in drills, unless very close. They will not require thinning until some are large enough for use, when they should be drawn, and those remaining will grow rapidly, thus gaining a succession from one sowing.

Radishes delight in a sandy soil. A little rotted manure or other fertilizer will cause a quick growth, thus securing a mild, crisp and tender bulb. Where land is not so valuable as to require very close planting, run furrows two and one-half feet apart for your Peas, dropping the seed in hills eight to twelve inches, according to the variety, dwarf needing less room than taller-growing sorts, eight to ten seeds in each hill; or, if it is only proposed to give horse cultivation, plant in a continuous drill, using a little more seed. Cover with the plow. Go through the rows with the cultivator as soon as they can be seen. Turn a furrow to them on each side when five or six inches high; thus you see Peas are a crop requiring but little labor comparatively, though picking is a slow and tiresome operation. Varieties: Little Gem, or some of the other *littles*, will do for very early, but for the main crop, I have never found anything better than the old Dan O'Rourke for market purposes. Later kinds generally find prices so low that they do not pay cost.

We often hear the slang expression, "He don't know beans" (Uncle TRUE will please grant pardon for using it here), which one would think could be applicable only in the lowest ranks of ignorance, but, my young friends, there are many of our older Ruralists that have yet to learn that a Black Wax is far superior to a Marrow as a snap bean. Plant as above directed for peas, though not so deep; two inches is enough. Do not work them when the dew is on and the ground dry, the dust will be likely to cause rust; if the earth is moist so that no dust will rise, harm will not result.

For early beets, I have found the Red Egyptian and Yellow Turnip the best. Red beets usually sell most readily. Throw up high ridges, plant two or three seeds about six inches apart, and do not thin until large enough for greens, drawing about one-half the young plants, and again, a week or ten days after, go over them, leaving only one plant in a hill. Tie up in bunches both the thinnings and the larger beets. The Swiss Chard is excellent for greens.

Lettuce, radishes and beets should be washed clean, which is rapidly done after bunching by rinsing in clean water. This must be carefully done, so that the leaves are not bruised.

Different markets call for different methods of preparing vegetables for sale; but let us all call on Uncle TRUE to give us an idea as to the most attractive forms which come under his observation, as to the size of bunches most desirable, and also if they are such as are quoted in the RURAL Market Reports.

SELF-HELPING BOYS.

MARY WAGER-FISHER.

"WILL you tie my necktie, please, Cousin MARY," asked Hubert coming toward me a morning or two ago, with a cravat hanging about his neck.

"*Avec plaisir*," I responded, "but how proud I should be to have a boy, sixteen years old, going to some woman to tie his necktie for him! Half the boys in the world I suppose do it, and a great many men. Indeed I have heard of men who led great armies to splendid victories, and of statesmen of immortal fame, who for their very lives could not arrange their neckties satisfactorily. Why, any girl of ten years of age, who owns ribbons, knows how to tie bows and knots beautifully! You don't catch the girls going to papa or uncle with "tie my necktie, please," you see girls are not such ninnies, Ah, Hubert!

"Well, I *can* tie mine, for that matter," says the lad deprecatingly. "Well, why do you not do it then? You boys now-a-days are not good for much. The smallest services for yourselves you can't do—such as to thread a needle, sew on a button, or sew up a rip in in your clothing. Why, when ANAXIMANDER was at college, if he wanted a button on his shirt, he would run a short stick through the cloth, and poke his knife through anywhere for a button hole. Such looking clothes as *he* had when he came home, mother says!—But it was all her fault. Mothers nowadays are not half Spartan enough. The boys must be coddled like babies; sleep in soft beds, and be tucked in like fruit in a pie-crust, waited on by mamma and sisters, and when once out from the house-roof, are perfectly helpless in regard to a score of things they ought perfectly well to know how to do."

"Oh fie, you can't expect a fellow to learn everything, Cousin MARY!"

"No; but I would teach him to be *independent*. I would have him able to sew on a button nicely, as well as to ride on horseback, as Julius Cæsar did. It is not half so ridiculous for a man to know how to sew, as to see him standing forlorn before his dressing-bureau, with his last clean shirt in his hands, and finding it buttonless. Moreover, it is highly essential, if a boy is to become a scientific man, for him to become accustomed early to using his fingers deftly. One reason why women sometimes become so superior in surgery and as dentists, is largely because they know how to use their fingers skillfully. If you were the son of an English nobleman, you would probably have to dispense with some of your sortships and endure hardships. Your lordly papa would stick you in an unearpeted room, with a hard mattress on the floor to sleep on, make you wait upon yourself in every particular, and keep you a stranger to cakes and preserves, for he knows, as well as every body ought to know, that unless a boy gets a certain amount of what he calls being "knocked about," he is not likely to ever amount to much. And I think boys ought to know how to cook certain dishes, too!"

"Oh my goodness!" roars HUBERT with laughter, "you would have a fellow jack-at-all-trades and good at none—a regular 'sissy—'"

"Oh, that is what you always fall back upon when anybody wants you to be something else than a blundering, awkward, dependent creature, that thinks he knows quite enough if he can harness a horse and eat his breakfast after it is cooked and spread for him. Why girls know how to do five times as many things as boys do! They know how to do nearly every thing that you do, and ever so many more! But I *do* think it is a ridiculous way to bring up boys to be so helpless, I would have them know enough of cookery to be able to cook at least a rude meal for themselves, if necessary. And in conclusion, I'd have them all able to tie their own neckties properly, or go without!"

"Amen! that's what I call a regular old preach, Cousin MARY; I expect to profit by it, and one day may be seen sitting in my modest doorway, patching my old clothes, as the great Mohammed used to do. Amen, I say!"

SCOLASTIC SCRAPS.

ALPHA BETA GAMMA.

NOT a few weeks ago, the editor of this department of the RURAL intimated that a contribution pertaining to school incidents, or similar happenings, would be likely to be acceptable to the readers of these columns. So I thought that I would be among those to accede to the invitation.

Truth is stranger than fiction. If it was not for this maxim I am sure some of you would think that some of the following incidents are fictitious or overdrawn. But no; they are taken from real life in a schoolroom.

A few days since, I dropped into the High School and Academy of B—, a thriving institution of learning, where there are in attendance about one hundred and fifty masculine book-fighters, or, in more refined language, male students. Although there are three divisions, or grades in the school, I visited only one room, so captivated did I become by their queer methods of precedure.

It was Friday when I called; a beautiful April morning. Saluting the teacher, Professor THOMAS, I took a seat. And not only was it Friday, but 'twas April fools' day. There were no unusual exercises to be held, nor anything else in particular expected to happen by the Professor.

The first lesson recited was Latin—"Cæsar." Master JOHN BINGHAM was called upon to commence the exercises. The paragraph that he read began, "Super postridie ejus diei superarver unt Gallian." This passage was actually rendered by the thoughtless boy thus: "They conquered Gaul on the next day *after supper!*"

The effect of this ridiculous translation upon the class is hard to describe. Suffice it to say, that neither merriment nor laughter would begin to express the universal ridicule of the poor fellow's rendering. It was sometime before the mistaken boy, thinking his translation was correct, was prevailed upon to take his seat. Probably the next time he tackles that word *super*, he will remember that it takes two p's to spell supper, and that the Latin super means "moreover."

The next study was Rhetoric. The lesson happened to be about the derivation of words, a very interesting exercise by the way. One of the boys was asked to give the meaning and derivation of the word "editorial." He said it meant information coming from the head. "It is a word coming from the mother country," said he, "Where it is pronounced "headitorial." "When an editor copies articles from other papers, they (the articles) are called clippings; but when the editor writes them himself, they are called 'headitorials,' 'cause they come from the head."

List, ye editors, spread your ears, for this is an explanation of the word which is the synonym for your labors. Verily, education is the cradle of genius!

Another sharp-witted youngster was requested to name the marks of accent. Thus did he reply: "The breve,—and the acute—and the macron,—and the—the—'fessor, I know it!—oh, yes, *and the omicron!*" It is needless to say that he had his Greek learning slightly mixed with his knowledge of the marks of accent.

By this time, I thought I had better leave. Their sharpness was piercing. It seemed as if they *originated* an answer to questions, when they did not know the true reply. They seemed to have an easy time. Hard study did not appear to be making inroads upon their flesh. As I surveyed the juvenile throng as it passed out of the room to take recess, these poetical four lines occurred to me as describing these boys:

> "'Tis as natural for them to speak Greek,
> As it is for a pig to squeak;
> And Latin is no more *difficile*,
> Than 'tis for a blackbird to whistle."

Recess being over, the afternoon exercises began. I had intended not to remain, but was induced to stay by the professor, who seemed somewhat vexed at the boys' actions that morning; but then I knew the reason for all that, it was April fool. Boys will be boys, you know.

About an hour was consumed in recitations in Arithmetic and Greek, at the conclusion of which, one of the pupils called his teacher's attention to the time of day.

"Why," said the Professor, "It *is* time to dismiss school. I was not aware that the time was flying so fast. Here it is 2 o'clock already." And with an astonished look he proceeded to his chair on the platform.

"Why, why, what's the matter!" he exclaimed, as he beheld his chair upside down. "Why, who 's been meddling with my bell?" said he, as he found it dumb, the clapper being tied with a string.

"April Fool! April Fool!" quickly came from all parts of the house.

"Ah! yes," replied the teacher, "You may go, boys; you are dismissed." It was some time afterward before Prof. THOMAS learned how badly he had been fooled—swindled out of an hour's time—by the hand of the clock being put forward one hour by those mischievous boys, when the teacher was working an example on the blackboard.

"I am sorry that the boys behaved so badly, to-day," apologized the Professor to me, as I took my leave.

"I understand it all," said I, "But there 's something to be thankful for. April Fool's day comes only once a year."

LETTERS FROM BOYS AND GIRLS.

Our Cushing Cousin.

DEAR RURAL COUSINS:—I come from a land of perpetual beauty. Lovely flowers bloom around my pathway, rivers murmur softly as they flow, winding between green banks. I walk in the woods, and hear the low sighing of the wind in the pine trees. The Cardinal bird flits across my path, and I stay my footsteps to listen to its voice. The beautiful yellow jessamine tempts me to pluck its fragrant blossoms, and twine them in my hair. Thus I wander on, the soft air of spring fanning my cheek, the warm sun shining from a cloudless sky, glinting through the trees and filling the dear old woods with a hazy, dreamy light. Hark! what sound is that I hear? 'Tis but the frogs in the stagnant pool singing "Home Sweet Home." Fair daughters of the North, it is from the "Sweet Sunny South" I come—Ah! this is exhausting, I will desist. Doubtless you know who I am by this time. Indeed, nothing was further from my intentions, than to drive Slayerofconceit from the field: I only indulged in a few quiet remarks; but, as a Cousin, I would advise him not to let his little temper rise.

He Would Like to be a Cousin.

UNCLE TRUE:—I should like to be one of the Cousins, I have read your papers for one or two years, and have always taken a great interest in the letters. I live on a farm, in Vermont. I think that Slayerofconceit ought to stand up for his rights as well as other folks, but I don't approve of his slurs on the girls, for I like the girls. As to what the girls can do out of doors; I think the best place for them is in the flower garden. I can sew with a thimble, or I can do house-work of most any kind as well as Rocky Mountain Joe. I think that Nellie S. is rather inquisitive, but that is no matter; I also think that Yankee Bill must be something pretty nice, there is so much said about him. The fear of that waste-basket has kept me from writing for a long time, but if this letter is published I shall try again.

North Thetford, Vt. BOX BOY.

What She Saw There.

DEAR COUSINS what has become of you all, have you been frightened away? Nell S. wished me to tell about my trip East. If I could tell of all I saw, it would fill one RURAL. Was in Boston at the dedication of the Soldiers' Monument on the Common. Visited the Museum, Natural History rooms, and Art Gallery, also Memorial Hall and Agassiz Museum in Cambridge. The fossils there were splendid. Never saw any before; did not think there were so many kinds of animals, birds, and fishes in Cambridge. Passed under the tree where Washington took command of the American army, July 3d, 1775. There is an iron fence built round it for protection. Visited the Atlantic coast and saw the ocean for the first time; should not like to go out far on it; hope to see more letters from the Cousins.

HARRIE B. HENDLEY.

A Little Girl who Improves her Time.

UNCLE TRUE:—I feel quite anxious to write to you again though it is but a short time since I last wrote. I take great pleasure in reading the Letter column, and was delighted with the last letter from Honolulu. I think that that young lady must have a pleasant home. I am reading Longfellow's poems and "The Arabian Nights." One of my favorite books is "Little Men," by Miss Alcott. Mamma thinks I am too small to read Dickens' works, but I have read "Oliver Twist" and like it. We are having beautiful weather now. Mamma, my brother and I are going to-morrow to gather flowers. We have nice house plants, but I like the wild ones best.

Best regards, L. E.

Otisville, N. Y.

Wake Up, Boys!

UNCLE TRUE AND RURAL COUSINS:—I thought I would write and see if you would admit me as a Cousin. I don't think that this Department is as lively as it ought to be with so many would-be smart girls in its columns. I don't think there are as many letters as there were last summer, and the only way that I can account for it is that the boys do not write as often as they did. Now then, boys, wake up! and I will let you know that you have a friend even in this land of cobble-stone and gravel. GREEN JOHN.

Sabbath Reading.

PATIENCE.

WERE there no night we could not read the stars,
The heavens would turn into a blinding glare;
Freedom is best seen through the prison bars,
And rough seas make the haven passing fair.

We cannot measure joys but by their loss;
When blessings fade away, we see them then;
Our richest clusters grow around the cross,
And in the night-time angels sing to men.

The seed must first lie buried deep in earth,
Before the lily opens to the sky;
So "light is sown," and gladness has its birth
In the dark deeps where we can only cry.

"Life out of death" is heaven's unwritten law;
Nay, it is written in a myriad forms;
The victor's palm grows on the fields of war,
And strength and beauty are the fruit of storms.

Come then, my soul, be brave to do and bear:
Thy life is bruised that it may be more sweet;
The cross will soon be left, the crown we'll wear—
Nay, we will cast it at our Saviour's feet.

And up among the glories never told,
Sweeter than music of the marriage bell,
Our hands will strike the vibrant harp of gold
To the glad song, "He doeth all things well."

[Sunday Magazine.

SHORT BIOGRAPHIES OF EMINENT PREACHERS.

THOMAS ARNOLD.

THOMAS ARNOLD, D. D., the noble schoolmaster of Rugby for fourteen years, was born at Cowes, June 13th, 1795. He was educated at Oxford, ordained in the Church of England in 1828, and died June 12th 1842. His character was marked by rare manliness, Christian sympathy, and profound scholarship. How he taught his pupils to love him, is well told in "Tom Brown's School-Days at Rugby." Besides his classical works, he left five volumes of Sermons. His thoughts are pure, vigorous, and independent.

ALBERT BARNES.

ALBERT BARNES was born near Rome, New York, December 1st 1798, and died in West Philadelphia, December 24th 1870. He was a graduate of Hamilton College and Princeton Theological Seminary. After a pastoral charge of five years in Morristown, New Jersey, he was installed in the First Presbyterian Church, Philadelphia, in 1830. Here he actively ministered thirty-seven years, when failing eye-sight compelled him to become Emeritus Pastor. For conscience's sake, Rev. Mr. Barnes repeatedly declined the well-earned title of Doctor of Divinity. By dint of utilizing the spare hours before 9 A. M., he composed twenty thoughtful volumes on religious and theological subjects. Chief among these were his Notes, on the New Testament, Isaiah, Daniel, and Psalms, whose circulation before his death reached a million volumes. His writings are clear, incisive and plain, richer in matter and method than style.

JOHN BUNYAN.

JOHN BUNYAN, the "Shakspeare of Divines," was born the son of a traveling tinker, at Elstow, Bedfordshire, in 1628. He was ignorant and dissipated till after his marriage, at the age of nineteen. In 1655 he became a Baptist preacher, and his zealous labors led, five years later, to his imprisonment in Bedford jail with other dissenters. "Here," states Dr. Barlow, "with only two books—the Bible and Fox's Book of Martyrs—he employed his time for twelve years and a half, in preaching to, and praying with, his fellow-prisoners, in writing several of his works ('Pilgrim's Progress,' etc.,) 'and in making tagged lace for the support of himself and family." After his release in 1662, he evangelized his brethren throughout England till his death at Snowhill, August 31st 1688. His imagination was strong and creative, his spirit earnest and profoundly religious; hence his masterpieces are his spiritual allegories.

CHARLES PETTIT M'ILVANE.

RT. REV. CHARLES PETTIT McILVANE, D. D., D. C. L., president of the American Tract Society, was born at Burlington, New Jersey, January 18th 1799. In his seventeenth year, he graduated at Nassau Hall, Princeton. From 1825 to 1827, he was chaplain and professor of ethics at West Point. While rector of St. Ann's Church, Brooklyn, in 1831, he delivered in the University of New York a series of admirable lectures on the historical "Evidences of Christianity." In published form, these have had a deserved popularity at home and abroad. He was consecrated Bishop of the Protestant Episcopal Church in the Diocese of Ohio the following year. By speech and pen, he has ever allied himself with the whole Church of Christ, well saying: "We drop our denomination uniform when we undress at the grave." Although now past threescore and ten, Bishop McIlvaine lately crossed the Atlantic to intercede with the Czar of Russia for the religious rights of his Protestant subjects. He died at Florence, Italy, March 13th.

Cæsar in warlike matters, minded more what was to conquer than what was conquered; what was to gain, than what was gained; so does a humble soul mind more what he should be, than what he is; what is to be done, than what is already accomplished.

LUTHER professeth, "That he profited more in the knowledge of the Scripture by private prayer in a short time, than he did by study in a longer space."

THE more our gifts and graces are exercised, the more they are strengthened and increased. *All acts strengthen habits.*

PERSONAL ITEMS.

The Lorillards pay the government $4,000,000 annually as a tax upon tobacco.

Jennie June says the Woman's Hotel was a failure because it was a man's idea.

William Cullen Bryant was a precocious youth and at ten years of age translated Latin poems.

Blanqui, the Communist, although 73 years old, is said to be plotting another revolution in France.

Only one man in Chicago pays more taxes than Long John Wentworth, and he has just presented that city with six acres of valuable land, to be devoted to park purposes.

The Dean of Chichester was select preacher at Oxford the other day. "Ye men of science," said he, "ye men of science, leave me my ancestors in Paradise, and I do not grudge you yours in the Zoological Gardens."

Cardinal Franchi was somewhat scandalized to learn that Leo XIII. required a billiard table to be installed at the Vatican; but when his holiness insisted that to play an hour at least daily was necessary for his health, the secretary yielded gracefully.

Mr. Peter Cooper has given up the scheme of founding a college for women in South Carolina. It is said that the representations made to him concerning the disposition of the people of the State to forward the scheme, were not strictly founded on facts.

Earl Beaconsfield is in his seventy-fourth year, Mr. Gladstone is seventy, John Bright is sixty-seven, Earl Granville sixty-three, Bismarck is sixty-three, Gortschakoff eighty, Von Moltke seventy-eight, MacMahon seventy-two and Dufaure seventy-six.

Mr. Froude, the historian, recently addressed to Dr. Newman a letter in which he says that "the principle of gravitation is only looked upon now as a hypothesis by all careful minds," and, further, that it would be far better if all mankind could agree "to hold their opinions as mere hypotheses."

Mrs. Lieutenant Hoxie, nee Ream, is described as a slight, fairy-like, or rather elf-like, little creature, with great, soft dark eyes that have an appealing, childish expression in them that is irresistible. She is quick of movement, and when dressed in her working-blouse, with her tangle of curls bound back with a blue gauze veil, she is the quaintest thing in her atelier.

MACHINES FOR
Threshing and Cleaning Grain and Sawing Wood.

Patented, Manufactured and Sold by
A. W. GRAY'S SONS,
Middletown Springs, Vt.

The machines with the improvements are the result of more than thirty years' careful study and experiment.

The proprietors are the inventors, ever have been and still are the sole manufacturers.

We have labored from the first to produce machines that will be durable, tasty, compact, portable, and that will run with the least possible friction.

We believe that we manufacture the best machine of the kind in the country.

Our machines have never failed to receive the highest award at all competitive exhibitions.

Circulars and Price Lists free. Address as above.

BRADLEY'S
CHANGEABLE SPEED MOWER

Has more good points, less complication, more adaptability and less parts than any other Mower in the world.

BRADLEY'S

Wit and Humor.

SPARKS AND SPLINTERS.

MERE 'airy nothings—bald heads.

THE Texas Legislature proposes to exempt the dogs of widows and orphans from taxation. The Barkises are willing.—Com'l Adv.

"Is Satan married?" asks the Chicago Times. No, he is a stingy, immoral old bachelor, and writes lying paragraphs about mothers-in-law, in order to scare young men away from matrimony.—Appleton's Journal.

AN optical delusion—Traveller: "Hi! guard! Have you seen a man walking about with one eye, of the name of Walker?" Guard (musingly): "N-no, sir, I dun-no as I 'av. What was the name of the other eye, sir?"

A FOP took a seat in a railroad car beside a young lady, but on perceiving she had a dog he moved off with an air of trepidation. "Don't be afraid," she said with a reassuring tone; "Jip won't bite you, he doesn't like veal!"

"Who was the doubting disciple?" asked the Sunday-school teacher. "Peter," promptly replied the small bad boy. "No, Thomas," said the teacher. "Then what do people always say 'Petered out' for?" asked the smart bad boy.

BEFORE beginning the second psalm for the day, a Glasgow minister reached down into his pocket and took a pinch of snuff. Even yet he cannot understand what there was in the first verse of the psalm to make the congregation laugh when he read: "My soul cleaveth to the dust."

A JOHN BULL, conversing with a Canadian Indian, asked him if he knew that the sun never sets on the Queen's dominions. "No," said the the Indian. "Do you know the reason why?" asked John. "Because Heaven is afraid to trust an Englishman in the dark." was the savage's reply.

A CLERK in a Philadelphia book-store, thinking to annoy a Quaker customer who looked as though he was fresh from the country, handed him a volume, saying: "Here is an excellent essay on the rearing of calves." "Thee had better present that to thy mother, young man," was the spontaneous reply of the Quaker.

A CITIZEN was arrested yesterday on a charge of shooting a neighbor's dog. His defence was that the animal was a nuisance, continually barking and biting, as is its nature to. "Oh," said the Justice: "then you shot the dog in self-defence?" "No!" was the rejoinder. "I shoots him in de head un'er de fence." He was acquitted.

AN obliging gentleman, who thinks that personal favors do not cost much, while they make friends, was applied to by a negro for a certificate of character, by which he might get a situation. The testimonial proving to be more complimentary than Scipio himself expected, that worthy, on recovering from his astonishment, exclaimed: "Say, Mr. ——, won't you gib me something to do yourself on dat recommendation?"

THERE was a little fellow who knew Mother Goose better than he know his Bible. One Sunday he was asked in his class, "Who were thrown into the fiery furnace?" That was too much for him. The question was passed; the answer came promptly, "Shradrach, Meshach and Abednego." This was a mortification to the little fellow, and when the next question came, "Who put them in?" he answered with, a jump "Little Johnny Green!"

Commercial Bulletin Spice—Money doesn't make the man, but twenty shillings make the sovereign.——When married men complain of being in hot water at home, it turns out half the time that it's scold.——A correspondent who says he has frequently heard of "Tara's halls," desires to know if old Tara was a bank president or a Fall River mill manager.——"England, sir! England rules the seas; Britannia rules the waves," pompously remarked an Englishman to an American. "That's nothing," was the reply, "every Yankee has a notion of his own."—— A young lady correspondent (poetic) desires to know if we have seen anything sweeter than "A Chaplet Alone." Certainly, we have seen a chap let a girl kiss him, which was ever so much sweeter.

There is Trouble in Store

For those who neglect to rectify irregularities of the stomach, liver and bowels, which they foolishly imagine will "come right of themselves." Of this silly error such persons are usually disabused by the development of some serious chronic malady, traceable to what they were pleased to consider a trifling disorder of the above-named associate organs. Such a culmination is easily avoided. A course of Hostetter's Stomach Bitters invariably has the effect of renewing the secretive action of a torpid liver, restoring healthy digestion and assimilation, and rendering the habit of body perfectly regular. The activity of these all-important functions being restored, and the entire system toned and regulated by this incomparable corrective and invigorant, no danger to the general health is to be apprehended from causes which, if not eradicated in time, will assuredly undermine it.

UNEXPECTED.

LADY (returning from a ride): "You know, Jane, I do not allow you to have your company in the kitchen."

JANE: "Then am I to take him into the parlor, ma'am!"

KINGSFORD'S
Oswego Starch!

Is the BEST and MOST ECONOMICAL in the World.

Is perfectly PURE—free from acids and other foreign substances that injure Linen.

Is STRONGER than any other—requiring much less quantity in using.

Is UNIFORM—stiffens and finishes work always the same.

Arboricultural.

RUSSIAN FORESTS.

Of the 8,351,004 square miles composing the Russian Empire, it is estimated by the best authorities that fully forty per cent. is covered with forests. These are very unequally distributed throughout the land, for while it is held that from 90 to 95 per cent. of the northern regions of the country is clothed with timber, not much over two per cent. of the southern portion is wooded. The vast steppes, or elevated plains, which form the greater part of the latter territory are, as a rule, nearly destitute of trees, while some of them are in great part mere barren tracts of sandy desert. Nor is all the north well furnished with timber, for the broad toondras, which, towards the Arctic Ocean, are the counterparts of the steppes of the more southerly regions, are, like some of these, bleak, treeless wastes. In the vicinity of towns, also, and along the course of navigable rivers, timber is fast becoming scarce owing to the reckless and improvident manner in which it has of late years been cut down to supply the demands of local manufacture as well as those of distant sections; for the timber trade of Russia is the most important branch of her internal commerce, and by means of vast rafts floated on the bosoms of her numerous rivers, the superabundance of one region is made to supply the insufficiency of another.

But despite the existence, here and there, of these bare oases, Russia can still boast of possessing within her broad boundaries, embracing one-sixth of the territorial globe and one twenty-sixth of its entire surface, some of the most extensive forests of the world. So vast are these in the Government of Novogorod and Twer, between St. Petersburg and Moscow, that it has been said that a squirrel of a roving turn of mind, could travel across the 390 miles between the two cities over the earth without ever touching it. The forest of Wolonski, at the sources of the Volga, is the most extensive in Europe; in the province of Perm, containing on both sides of the Ural Mountains, 18,000,000 deciatines, 17,000,000 deciatines are covered with pine forests; and of 1,085,671,000 acres in European Russia, 421,200,000 acres are wooded. In this mighty area are included the Black Forest, which covers a surface of about 4,000 versts or 2,653 square miles; the noble forests of Archangel, Wiatki, Olonetz, Minsk, Wilna, Jitomar and the magnificent lime forest of Kostroma. The Russian lime trees frequently display tops but slightly developed, and possess only insignificant branches; in this differing widely in appearance from the close ramifications which characterize trees of the same species in other parts of the world. The Oaks, too, are there adorned with fewer branches and thinner foliage than elsewhere, probably in consequence of the scarcity of atmospheric humidity. Indeed the Russian forests are often etiolated by droughts which, while injurious to trees of all kinds, are especially destructive to the Ash, Hazel and Elm.

In the Crimea, also, grand old woodlands abound, stretching over the two slopes of the central range ridging the peninsula. The hights which line the coast about battle-renowned Balaklava, are likewise clad with dense forests spreading thickly between Babougine-Yaila and Schahr-Dagh. The pine forests of Taurida, and the huge beech woods of Laspi are also worthy of mention. In Ukraine, too, where the black earth, mellifluously called stepnoiezernozem, is found, Oaks, Limes and Elms display a wondrous vigor of growth, and are associated with an immense number of magnificent pear trees. The vast frontier between Russia and Poland, in Lithuania, has a world-wide celebrity for its gigantic forest, extending over the entire district of Bialistock. A genuine "forest primeval" is this, in which the last descendants of the fierce urus, reputed to be the wild ancestor of our present races of domesticated cattle, still roam fearlessly in savage freedom with the buffalo and elk. Amid these lonely wilds and gloomy depths, the Ruskis form a distinct population, living a savage life in rude harmony with that of the wild animals around them.

In Asiatic Russia the forests spread still more broadly, and are arrested only by the intense Arctic cold which checks luxuriant vegetation. In the government of Kasan oak forests abound; on the north the coniferæ predominate, and on the south the Lime, Ash and Maple. Huge forests of Fir cover the banks of the Irtysch, the Barnaol and the Alei. The slopes of Atbachi are grandly robed in Pines and Larches, and its valleys clad with Rhododendrons, wild Currants and dwarf Birches. Forests of Black Poplar skirt the hills between Ouspenka and Thorne, and in many regions between the Alei and Irtysch there are vast tracts of jungle and forest in which the foot of man has never trod; while the mountain chains of Tazkel and Sayansk are roofed with sombre masses of umbrageous Birches.

In Russia each kind of forest has a special name descriptive of its nature. The fir forest is called picktovnikk, the birch, bereznikk while forests of Oak, Lime, Maple, Ash, Larch, and numerous other trees, as well as those on marshy ground, in hollows, on sandy plains, or of specially lofty growth, have each a descriptive name equally brief and sonorous.

But even the mighty forests of Holy Russia are rapidly disappearing beneath the advancing tread of civilization and its attendant—industry; and the axe of the lately liberated Muscovite serf is busily doing the work of destruction. Within the past twenty years rich meadows and outspreading pastures furnish abundant feed to countless herds where formerly the cavernous gloom of intertwining boughs and the rank luxuriance of tangled undergrowth afforded a refuge only to wild beasts, while impenetrable

A RUSSIAN FOREST.

to man. Broad fields, smiling with abundant grain crops, now occupy the sites of dense jungles, while on lands cleared but not cultivated, small thickets of Birch are rapidly springing up and these are soon followed by an array of Pines—a phenomenon of alternation in forest, growth not unknown on this side of the Atlantic.

From these forests the Russian peasant sup-

plies nearly all his wants except those of the inner and the outer man. He builds his cottage with the timber; heats his rooms with it; makes his household utensils and agricultural implements of the same material, while his shoes and mats for bed-clothes and floor covering are made from the inner bark of the lime tree, and many other trees serve for him a multitude of different purposes.

It must be ages, however, before the increase of population throughout the country will make any serious inroads on the vast area of forest lands, thousands of miles of which have never been seen by human eye. Despite the fact that Russia numbers a population of about 85,685,000, the ratio of inhabitants to the square mile is only 50 in European and one in Asiatic Russia, while in recent years the average increase has been at the rate of 1⅛ per cent. per annum. Yet it may be that the destruction the necessities of so vast a multitude would not effect for centuries, the improvident wastefulness of a part of it may accomplish in as many decades.

Farm Topics.

JOTTINGS AT KIRBY HOMESTEAD.

COL. F. D. CURTIS.

If the buyers of wool were not so arbitrary and unreasonable in the rule to shrink one-third for unwashed wool, sheep would not be subjected to the fright and injury caused by washing. As the custom now is, all unwashed wools are shrunk one-third in the weight. Buyers in this section of the country—and they have the same rule in New York—pay as much per pound for the unwashed as for the washed wool, but in the weight they reduce the former one-third. This is without any reference to the amount of dirt or the kind of wool. So long as this rule is enforced, farmers will wash their sheep, but if the wool should be graded according to its actual condition of more or less of dirt, and the price be made accordingly, but few farmers would wash their sheep, as it is a dirty job and risky, too, for the health of the washers; for they are apt to catch cold from the exposure. Sheep often get smothered when huddled together and crowded in the pen by the water. We have known two dead ones to be taken out at a time, trampled upon and smothered. It used to make but little difference how much or little wool was washed. If it had only been dipped in the water, it went all the same. This was when wool was high, but now when wool is low, buyers are more particular and disposed to push rules to the utmost and make old customs into arbitrary requirements. As long as this is so, we must wash the sheep, however disagreeable it may be or we shall lose too much.

The washing should be done with care and with as little pulling and hauling of the sheep as possible. A careful man should hand the sheep to the washer who, being stationed in the water, can float the animal easily, and by holding the head against his breast, can use both hands to squeeze the wool and loosen the dirt. A current of water is the best, as it helps the washer to get the dirt out. The best place we ever knew of was behind a water-wheel where the swift currents sent from the wheel did the work effectually. It is hurtful to sheep to hold them under a column of falling water, as it chills them. The least danger to the sheep is to float them in a running stream, as the water will not be so cold and the animal cannot struggle to harm itself. If sheep are driven to the stream during the heat of the day, they should be allowed to cool off before being taken into the water. Tub washing is good, if a stream, can be kept running in and out all of the time, otherwise the water will become so foul that the wool will not be cleansed. Sheep will always struggle more in a tub than in a stream, and they always handle best when their feet cannot touch anything.

To catch a sheep by the wool and throw it into the water is an outrage, as the skin is made sore by pulling the roots of the wool, and then the animal is nearly suffocated by the unnatural filling of the nostrils and windpipe with water. A sheep should be caught by the hind legs or around the neck, and then no pain is caused or harm done. The water ought to be squeezed out of the wool at the edge of the washing place to reduce weight, so that the sheep can walk home easier and dry out sooner. After washing, sheep should run from ten days to two weeks to give time to get thoroughly dry and for the oil to start out, which improves the handling and condition of the fleece.

Eight cents per head was the price we paid last year for shearing. This year we expect it to be at least two cents less. In old times, four cents was the price, but sheep and shearers were more plentiful then and there was more competition.

In some ground it is better to roll the grain after it is up, especially if the dry time comes on. It is always best if the ground happens to be wet or very moist when the grain is sown. Rolling after the grain is up, will crack the crust and mellow the surface and will not injure the crop. Esquire DAVIDSON says he has greatly benefited his oats by rolling them, although they might be quite large, several inches high. He thinks they will stool out more and the crop will be heavier. Regular rules will not always do for farmers; they cannot always do just as their fathers did, or if they do, they will make mistakes, as for instance, on the rolling question. A man may say "My father always rolled his oat-ground, and he had good oats." Yet he might have had better oats sometimes if he had not rolled them. This is our case this year. We have made a blunder in rolling at the time of sowing; better have waited until the ground was drier, or not have rolled at all. We must be governed more by circumstances than by rules.

The tobacco smoke has saved all of the chickens sick with gapes so far—the one almost dead when the remedy was first applied seems cured. They have been smoked six times. A few live coals are put in an old iron pot, and a pinch of tobacco placed on them. As soon as the smoke begins to rise, the chickens which have previously been placed in a basket, are put over the vessel and covered with a cloth. They, or any one thus affected, are made to inhale the smoke until they tumble over partially insensible, when they are removed from the basket. They soon revive and the spasms have lessened.

VAN'S VIEWS.

GETTING OFF THE TRACK.

WERE you ever on a train to which some accident happened so that it lost the right of way? And do you call to mind how, before the accident, you were humming along, the freight trains, the way trains and specials standing respectfully to one side while you went bounding by? And how, after your break-down, you had first to yield the track to an emigrant train, then to a dirty cattle train, next to a smutty coal or ore train, and afterwards to a heavy lumber or wheat train. How the countenances of the passengers change! How the very engine seems to feel ashamed, and neither the bell nor the whistle sounds as it did before! Well, some of us, this spring, got in the same fix as that train. We had most of our grain sowed and some of it ditched and ready for business, but most of it was left just as it was when we got through sowing and it began to rain; and it rained one day, and then it rained the next day, and then began the next morning and rained all day; then it kept raining steadily for two or three days right along; then it stopped, but by that time our grain had all the water it could ask for, and we might as well have had a little less.

We were out in the rain, and all through the intermittent spells with our spades and hoes, but it was tedious and unsatisfactory work. Many fields were caught unsown, and some are just, May 28th, getting in the last of their oats. This doesn't look well, but I don't know how we can better ourselves, for we got "out" and lost the "right of way," and here we are.

One thing that would help us is a large double-mold-board plow to clean out our dead furrows with, so as to let off the water "when it showers;" for "it never rains but it pours," and we need a chance for the water to run off rapidly. With a few under-drains, and the dead furrows well opened, our heavy clays will yield us a fair return for our labor, and not be the curse which many consider them. If the plow spoken of by Prof. I. P. ROBERTS in the RURAL for May 18th, is made with steel mold-boards, and is for sale in this country, I think it might help us.

Speaking of under-draining reminds me that a neighbor on a clay loam with a heavy clay subsoil, finds that drains laid through the low places, and above 100 feet apart, dry his land well. The plan generally followed around here, is to take a three and a four-inch strip of inch-thick lumber and nail them in a ∧ shape. This we use for all laterals less than one thousand feet; main ditches must be larger. For each 16-feet section, lay about four bits of board crosswise on the bottom of the ditch; on those place your trough, put a bit of sod over the joint, and pitch in your dirt again. If able, I am going to lay some of these drains this season, and hope, by using my common and subsoil plows, to be able to reduce the cost of doing such work to a figure at which a man may feel able to go on with the work until the ponds are removed from his meadows and wheat fields.

We can all raise good crops in good years. In 1875 there were such yields as 80 bushels of oats, 42 of wheat, and 69 of barley per acre, and we have had 65 bushels of shelled corn per acre. But on the off year we raise twenty or thirty bushels of oats and ten or twenty of wheat. Now, we are told that under-draining will help us on these poor years, and bring up our average to where the good years would leave us; if this be so, under-draining would be a good investment.

Talking with a neighbor, the other day, about this, and looking at two pieces of land lying side by side, one drained and the other not, he said: "If draining will do the same for all our land that it does on this piece, and I see no reason why it should not, what fools we are to work away on undrained land!" What we lack is faith; we have not faith in our business; we are afraid to run in debt to try what we consider an experiment. Another thing is the high rate of interest which we are compelled to pay. Ten per cent. is the going rate in this region. If money could be had at six or seven per cent. we might have courage to borrow enough to enable us to go to work.

There have been many circulars of a kind of plow called a mole-plow, sent into this neighborhood and one of my neighbors has one, but he has not used it for some time, so I suppose it is not a success though I have heard good reports from it in other places; but candor compels me to say these were a long distance from here.

Scientific and Useful.

EXPERIMENTS WITH COMMERCIAL FERTILIZERS.

PROFESSOR O. C. CALDWELL.

IN an article on agricultural experimentation, in a recent number of the Tribune, to some parts of which you have taken exception, in a kindly way, in the RURAL of June 8th, the farmer was supposed to have in view two main objects in experimenting with chemical fertilizers: 1. To ascertain for his own benefit whether he can use any of them with profit on his own farm; 2. To aid his brother farmers, making similar inquiries, by giving to them the results of his experience. The experiments are not made solely, or even chiefly, for the purpose of ascertaining which constituent of the fertilizers his soil stands most in need of, but of learning whether as a financial operation, it will pay to buy one or another of these substances, at the ordinary market prices, to apply to his land; whether in the usual run of seasons he will get his money back and a little more for profit.

It is my assertion that such experiments should be repeated in order that a farmer may safely proceed, on the basis of their results, to invest a portion of his limited means in commercial fertilizers, or may consider his results a real addition to the common stock of knowledge in regard to the relations between these fertilizers and our soils and crops, to which you take more particular exception; and you ask in reference to one of my illustrations of this point, drawn from the chemical laboratory, "What parallelism is there between determining phosphoric acid in a fertilizer in the laboratory and ascertaining the effect of superphosphate on wheat or any other crop in the field?" "Just this," I answer, "that each operation is performed for the purpose of getting a certain definite piece of information, that may be used as the basis for a financial operation; the information must therefore be reliable or it is worse than useless; for the chemical part of the comparison I might just as well have taken the determination of iron, or of gold or silver in an ore. If a hasty and ill-founded conclusion in the laboratory may work great mischief, which no one will deny, a similiar conclusion in the field may be attended with similar results.

It appears to you that in the case of several plots side by side treated with different manures, all will be affected alike by the weather, no matter whether it be favorable, unfavorable or indifferent. It appears to me otherwise, and that favorable or unfavorable seasons may or may not affect the several plots alike. The chemical fertilizers ordinarily used contain as their only valuable ingredients, phosphoric acid, nitrogen and potash, one or two or all of them, in forms that differ much in respect to solubility in water; every one of these ingredients must be brought into solution before it can enter the plant; and by the greater or less diffusion of the solution in the soil, so that the rootlets can find this added food wherever they go, the effect of the fertilizer can be increased to a greater or less extent. If the season is unpropitious on account of a deficiency of rain, that ingredient of the several fertilizers experimented with which is most soluble, and which with this small amount of rain may be most freely distributed in the soil, may produce the largest effect on the crop, and, as compared with the unmanured crop, may appear to be the best investment.

Another season's trial, with a fair amount of rain distributing all the fertilizers more evenly, may tell another story; and still a third, with a superabundance of rain, may give nearly as good a crop on the unmanured plot as on any of the others. If the season be an average one, not only as to the amount but also as to the distribution of the rain through the growing season, and all the plots should be treated alike except as to manure, planted together on the same day, cultivated on the same days, and in the same manner, and any one plot should yield a crop largely exceeding the others, the fertilizer which that plot received might well be added on a larger scale to that field the next year; but I should still watch it as a continuation of my experiment. Such a clear and decisive answer does not, however, come to every experimenter who puts this important question to his soils the first time, as I think, many a witness will testify who has tried it.

If the position I have taken, in regard to the necessity of the repetition of experiments, is an untenable one, my error can be exposed by showing that when an experiment is repeated, it always gives the same answer every time; evidently the first result is just as good as a dozen, then. But the records of repeated experiments do not exhibit such perfect agreement; on the contrary, they show in many cases a second year's results quite different from the first, and there may be, sometimes, no satisfactory way of accounting for the difference. But whether we can explain it or not, which result shall be taken for our guide in the selection of manures for the second year? One of the results must surely mislead us; if the second one was right, then we should have made a serious mistake if we had tried the experiment but one year and followed the lead indicated by that. The farmer who bases extensive operations in commercial fertilizers on the results of a single year's experiments on a small scale, cannot, it appears to me, be quite sure he is right, and he may run risks he cannot well afford.

"Nothing ventured, nothing gained," is an excellent maxim in any business; but the safer the venture the surer the gain. No one can read over the widely different reports, coming from different parties, of their experience with phosphates and other commercial fertilizers, or reports of repeated experiments, without feeling that any use of such manures is, to a greater or less extent, a venture which, like the cargo sent out by a merchant to a distant port, may possibly not yield a profitable return; and the wise farmer should, like the wise merchant, while still ready to run the risk as a legitimate part of his business, spare no trouble that he can take to inform himself as to the best consignment to be made, and the best manner of making it.

I would not, by any means, discourage experiments with chemical fertilizers, for I consider such work as a very important means of agricultural progress, especially in the older States; but I should have the farmer value, at their just rate, all the agencies which take part in making up his crops, and assure himself that he does not attribute a given effect to one agency, that belongs to another, and that he gives the manure credit for no more than its due. No one will rejoice more than I if the experience of "the hundreds of farmers experimenting with manures this season in the hopes of obtaining practical results at its close," shall show that, in general, a single year's experiments are sufficient for the accomplishment of the two objects for which, as I take it, this experimentation is carried on. But in order that this may be shown, we must have, besides a careful record of this year's results, a no less careful record of the results of the application next year of the fertilizers whose use is indicated as profitable. The question at issue can be settled only in such a way as this. We may theorize about it, you, Mr. Editor, on one side, and I on the other, but that will not be enough. I hope that the farmers themselves will step in and help us as well as themselves, and send in from all sides to your columns and those of other agricultural papers, the facts and figures for two or three consecutive years, that we need to test our theories.

Cornell University.

Farm Economy.

DELAYS ARE DANGEROUS.

THERE is no class of people to whom this old adage applies with more propriety than to farmers. There is a whole page of sayings of similar import. "A stitch in time saves nine," "Once done never forgotten." "Never put off until to-morrow what can be done to-day" etc, all of which are intended to impress the idea of punctuality.

If one arises in the morning, confronted by the fact that there are half a dozen things awaiting his attention, that must be done before the work laid out for the day can be commenced, it is at once an annoyance, and a delay results probably in carrying over to the next day a portion of the task assigned for this and making everything go the harder for the friction.

The best time to do anything is at the first convenient opportunity that offers after the doing becomes a necessity. We would not have a man leave a hay field, and go a mile or two for tools and appliances to replace a broken tooth in a rake—but we would have him replace it before the rake was again taken into the field. A strap or a string may serve to repair a broken harness for the time, but the farmer should no more think of continuing its use in an unsafe condition than the sailor should think of putting to sea for a new voyage with the jury masts he had rigged with which to make port after his spars had been carried away by a gale.

Neither should he neglect to keep close attention to everything about the premises. That gate post is an inch from the perpendicular to-day—not sufficient to attract general

notice. It will requre but a little labor now to put it in place. Don't wait till it leans six inches and the gate touches the ground, requiring much effort to swing it. A loose nut may be discovered by an examination, which, if left to itself, will result in a break-down at a very inconvenient time and place. The horse's shoe may be tightened now, if the necessity be observed, with little trouble; delay may cause serious injury.

To do things promptly and at the earliest moment, will make just the difference of allowing you to drive your work ahead in accordance with your proposed plans—or to be driven to do your work at a disadvantage. If you can choose your time and plow a field when it is just in the right condition, you gain—if you are compelled to plow when either too wet or too dry, because other work is driving and you have no choice, you will lose—and so with every department of farm work. If you will keep ahead, well—if not your work will keep ahead of you and when the season is over, you will have labored more and accomplished less than your neighbor who has learned that delays are dangerous, and does everything in season.

DEPTH FOR COVERING SEEDS.

W. J. FOWLER.

THREE times the diameter of the seed to be planted is the rule among market gardeners. And this rule in my experience holds good for most farm crops with the exception that most farm fields are not got in so fine tilth as market gardens, and therefore seeds need to be planted somewhat deeper than they otherwise should. In other words, we have to cover twice or three times the depth we ought, because the soil is stony or cloddy. Through this extra amount of lumpy earth the tender shoot has to push its way to light and air. This is the first move the young plant makes and the check from too much or unsuitable covering retards its vigor through all after growth. With fine, moist and rich earth as a covering, plants get a vigorous start from the first, and are soon beyond danger from the ailments which pertain to stunted growth. Seeds planted at the right depth, which is shallow, start their first roots in the proper place and do not need to put forth a second series. No matter how shallow seed is planted, provided the soil is in right condition, the plant roots will be deep enough. I have often known wheat, barley and oats sown broad-cast on newly plowed ground and never covered except as rains washed the grain into the loose soil. Such pieces never failed to make a vigorous early growth, and if the soil was rich enough, a good crop. This fact has often been noted by farmers, and yet nine out of ten think it a point gained if they put the seed, and especially winter grain, deep in the ground. They have some pet theory that deep drilling or deep covering of wheat will enable it to resist frost better, and though a thousand facts contravene this theory, the facts are forgotten and the notion is retained. Frost penetrates from six inches to three feet deep here in Western New York, so that no depth of covering will save wheat from winter-killing. In point of fact, light frosts reaching only two or three inches in depth are much more damaging to wheat than the steady cold weather of winter, when the ground is frozen deeply all the time.

For spring grain, and especially for barley, shallow covering is important. There is no frost to injure it, but the season for spring grain is so short that a little more or less in depth of sowing makes several days' difference in time of ripening. In nearly half the barley and oats grown we find part that is green from unripeness, giving the grain a stained and rusty appearance. These stained grains are the product of seed that has been delayed in ripening, and in almost every case by being covered too deeply. With oats this does not make so much difference; but malsters complain of barley that is uneven in ripening, and in seasons when barley is cheap, will not buy it. Thousands of dollars are yearly lost by farmers from this cause, rendering barley, in such seasons as the past, unfit for anything but feeding purposes. Of all crops barley should be sown at a uniform depth. For this purpose a drill set as shallow as possible, is the best implement. If the soil is lumpy, do not set the drill deeper, but drag across the drill marks, finishing with the Thomas Smoothing harrow and the roller, to mellow the surface and break down lumps.

Some drills have what is called a zigzag attachment throwing every other tooth forward of the one beside it. It is very handy in lumpy, stony or soddy ground, but it is a very poor thing for the crop. I never liked this way of putting in grain, and the more I see of it and think about it the more dissatisfied I become with it. On no account would I have grain of any kind put in by it. On cloddy ground it seems very nice to see the lumps slipping by the drill tubes instead of being dragged before them, but it is better to have a man follow the drill all day watching the tubes than to set them so that every alternate tube throws a ridge of these hard clods over the next row of plants. What if the drill "won't half cover" the seed without being set on this fashion? What you call "not half covering the seed" is, in all probability about the depth it should be put in. Follow the drill with the drag and roller, and the crop will be as good as the soil is capable of producing. What is quite as important, the seed will be covered a nearly uniform depth, and the crop will all be ripe together. There is altogether more fear than need be that farm seeds will not be covered deeply enough, and this zigzag attachment to drills is only a device to enable shiftless farmers who do not get their soil in proper condition before seeding, to leave the field after drilling looking nearly as well as if it had been properly prepared. What we want is not only to have the field appear in good condition but to produce a good crop of evenly ripened grain.

GARDEN TALKS AND WALKS.

THE BEECHES, MASS., June 8, 1878.

FROM the 20th of May till the 1st of June was the season of Mr. SARGENT'S Azalea Show at Brookline. I went to see them on the 29th, and a splendid show they made. They are the greenhouse kinds, grown in pots, and wintered in a cold-pit, and otherwise retarded as late as practicable, to bring them into bloom after other folks' are mostly past, and have as companions hardy Rhododendrons, Azaleas and other spring flowers. Conspicuous among them were decora, a red-blooming kind, and a massive specimen some 4 feet high above the pot and 6½ feet through at the base; Iveriana, Bride of Abydos, Beauty of Europe, Beauty of America, King of Holland, Daphne, Marquis of Lorne, Exquisite, Crispiflora, Variegata, Criterion, and Flower-of the-Day.

But outside of the exhibition tent is an enjoyable treat. The garden and pleasure grounds compriso some 130 acres, and are wooded, undulated, and planted in tasteful fashion. Where the natural rolls interfered with distant views, they have been toned down, divided or removed, and graded off so naturally as to conceal artificial work, and thus a finished and pleasing effect, is secured; and, turn where you will, a bird's-eye view of some distant locality issure to present itself. The garden is sheltered by belts of heavy timber, bnt the interior is planted in groups or with isolated specimens. Some of our Colorado and Western Conifers are handsome specimens, and beds and banks are formed of Japanese Retinosporas and other hardy evergreens. English Yews and LAWSON'S Cypress, and some others, though hardy along the Hudson, are tender here; but Mr. SARGENT winters them in pits and cellars, and transfers them to their summer quarters about the end of April; and really they look as fresh as if growing permanently where they stand. Mr. S., for tree planting, advocates big holes, say 10 feet wide by 3 feet deep, filled up with the best of the old soil mixed with old muck, peat, or other fresh earth, and afterwards annually cultivated in the summer time till the trees are several years old. For little trees such mighty digging may be laughable to some people, but I side with Mr. S. in this case; the trees speak the result. Among common trees and shrubs none was prettier or more floriferous than Cornus florida of our woods; and in the shrubbery belts, the crimson-leaved Japanese Maples were as telling as Copper-beeches are among trees.

But one of the most interesting features of this place was the Wild Garden, that is, a wooded dell all growing over with vines, shrubs, ferns, and the like, made the most enjoyable part of the garden in spring. In this place are naturalized hosts of Crocuses, Daffodils, Jonquils, Squills, Tulips, Irises, English Primroses, Phloxes, and many other spring flowers that come up and blossom in perfection in spring, while their location is open and sunny by leafless trees. During the summer-time they are sheltered, shaded and undisturbed, just as they prefer to be. It is not the winter's severity so much as the summer's sun that, in this country, proves fatal to so many European woodland plants. For instance, English Primroses growing in a shady rockery here, live over through the winter and blossom splendidly in spring; but in the open garden-border they invariably die.

Another noteworthy feature of this garden is the clumps of beautiful Rhododendrons that surround the lake and the masses of hardy Azaleas in a sheltered nook in the garden. These Azaleas are planted in a large bed and interplanted with Lilies of all kinds, and all are allowed to grow up unmolested together. The Lilies love this treatment and year after year strengthen and multiply; besides, they prolong the blooming period of the bed from May till September.

I have also been to see the garden of FRANCIS PARKMAN, Esq., at Jamaica Plains, and an interesting spot it is. Mr. P. is an enthusiastic amateur gardener, and has done considerable work in hybridization and propagation, particularly as regards hardy herbaceous plants and shrubs. He showed me some lily plants—the second generation of hybrids, using as the female parent Lilium longiflorum var Takesima, a beautiful white flowering Japanese Lily, and as male, Lilium lancifolium. And still no deviation whatever from the female parent is traceable in the offspring, beyond some abortive stamens and a less tendency to produce seeds, and some of the anthers changing to a trifle darker color. A third generation is expected to bloom this year. Mr. P. also showed me a rose-bush, a cross between our Prairie Rose and a Moss-rose. It is now four years old from seed, has the habit of the Prairie Rose, and is mossy. It is full of flower-buds just now, but none has yet opened; it did not bloom before. Clematis Miss Bateman is one of the finest and showiest of garden varieties with pale blue flowers, and blooms towards the end of May. Mr. P. sowed seeds of Miss Bateman and raised a numerous progeny. They are now in blossom, and present all colors from the deepest violet purple to almost white, but not one is precisely like the parent in color, nor so good in form or substance.

Here I also saw Forsythia Fortunei trained as a standard, just as if it were a Weeping Willow or Bird Cherry, or one of the old standard rose bushes of our boyhood. It is not "worked" on another stock, but to begin with, a stout, clean wythe is staked erect, pinched at the required hight, say five feet, and top-shoots allowed to form and depend, but side-shoots rubbed off as they apear. After two or three years the stems become self-supporting, and stakes are dispensed with. In this state they bloom, first-rate too, as the the old plant can amply testify.

A little breeze has sprung up in American and English horticultural circles, incited by a misinterpreted statement of Mr. THOMAS MEEHAN regarding the fruiting of the Wistaria. Mr. P. showed me an old Wistaria hugging the stem and inter-twining among the branches of an old Hemlock Spruce, and which, last year, bore an immense quantity of fruits, as many of the pods still hanging can show. But I note that Wistarias around Boston have bloomed rather sparsely this spring. In a nook in a shady border I saw Primula Japonica and some Aurienlas in bloom. Mr. P. tells me, however, that though they stood out there last winter and look pretty well, they are not reliably hardy.

A friend, writing to me from Dallas, Texas, says: "It is a very rare occurrence to get land within two miles of Dallas for less than 100 dollars an acre; but sandy loam, some ten or twelve miles from Dallas and on the Dallas and Wichita R. R., can be bought for about 35 dollars an acre. The same kind of land some four and a half, or five miles from Weatherford (which is not near the railroad,) for five or six dollars an acre. Neither Pears nor Apples do well around here, though Pears certainly do the best of the two. Wild-Goose Plums are great favorites, and Grapes do pretty well. Most kinds of Peaches do first-rate, and the following kinds are most planted: Early Beatrice, Amsden, Alexander, Foster, Hale's Early, Crawford's Early, Old Mixon, Chinese Cling, Stump-the-world, Crawford's Late, Heath Cling, and Ward's Late."

S. Q. LENT, at p. 358, just speaks my mind in advocating the ornamental garden as a farm requisite, and a family-refining and cementing influence. And, in reference to this question, permit me to repeat here what I once wrote in a frontier paper; and I assure you I spoke from experience;—No home of any pretentions should lack a few shrubs or flowers; their very presence is the sign-board of civilization and their absence the same of backwardness and aboriginality. Some farmers prefer hogs, dogs, chickens and cats, romping around their doors, breeding stench and insects, to the healthful fragrance and cleanliness of flowers and shrubs. The industrious, intelligent and educated farmer has a place for everything, a flower garden, a vegetable plot, an orchard, good crops and good stock; whereas, the indifferent has none of the first, and but sorry proportions of any of the rest. The exterior of a home bespeaks the interior. Calves, hogs, dogs, big weeds and scrub-wood in the yard bid far from inviting in the house, whereas a few shade trees, a few shrubs and common flowers with neatness and cleanliness outside the house, bespeak health and concord, plenty and prosperity, education and intelligence within it.

RENOCLAF.

HORTICULTURAL PROCEEDINGS IN MICH. AGRICULTURAL COLLEGE.

WE have received a copy of the "Report of the Professor of Botany and Horticulture of Michigan State Agricultural College." Our readers have already been favored with parts of this plain, practical document. We select a few others which we do not remember to have seen in print.

TREE EXPERIMENTS.

Three years ago last spring a few Silver-leaved Maples were taken from the river bottoms. They were small, and about three to six inches in hight. In three years they have become thirteen feet high and two and a half inches in diameter. Some of the limbs, last year and this, have grown, in one year, four to five feet. From the seed these have been twice transplanted. They have grown one year on the flats and three years in the forestry. A few Catalpas, four years grown, are nearly as tall and nearly as large as the Silver-leaved Maples, although they have been moved once, and have been killed back to some extent during two winters. Experiments are being made with European Larch, White Pine, Blue Ash, American Elm, Rock Elm, Red Elm, White Oak, Norway Spruce, and small quantities of numerous other sorts. They are still carrying on interesting experiments in the different modes of cultivating apple trees by mulch, manure, ashes, the plow, etc. They have tried these long enough in their orchard to become convinced that these trees left in grass with no manure, will not be profitable.

Last April Prof. BEAL began, on two trees, to take off a limb on the 25th of each month of the year. The intention was to watch these to see which would do the best after a test of several years. Several unsuccessful attempts were made to put in cions (and have them live) in which the buds were split. Cions of different varieties were carefully split through the middle of a bud, and a half cion of one variety was tied to half a cion of the other, and the whole used in a cleft graft. He intends to repeat this another year.

ONIONS.

One of the best points, it seems to him, to make improvements in our onions, is to improve their qualities for late keeping in spring. This can be done, to some extent, by continually selecting in spring the best keepers only for seed. He has sent a small quantity of the seed to several men in the State, who will go on with the experiment in the same way as they are doing at the college.

Our own experiments with tomatoes, together with the college experiments with the same varieties, are given at length.

CORN.

Prof. B. crossed some White Dent from one locality with pollen from White Dent obtained in a remote locality. This may add vigor to the race, though it will probably not otherwise change it. The plan was conceived by him about a year ago, and several months afterwards experiments of the same kind were reported on many species of plants by Mr. CHARLES DARWIN, of England. The favorable results of many experiments there given are quite remarkable. In a lecture at a Farmers' Institute last winter he spoke of a new way of raising seed corn; *i. e.*, in a patch by itself, where good cultivation should be given and all the poor stalks should either be removed or have their tops cut off before shedding any pollen. This he did the past year, and was gratified to know that at least one other man thinks the experiment sensible. His name is Dr. E. L. STURTEVANT of Massachusetts, the editor of the Scientific Farmer. He now advertises to sell seed corn raised by this improved method. In his experiments, though half the tops of the corn were cut off, there seemed to be enough pollen left to insure full ears on the stalks.

Miscellaneous

THE TRUTH ABOUT IT.

[UNDER this heading, a number of articles have been prepared by able writers. These will appear from time to time. Their object is not at all to deal with "humbugs"—but with the many unconscious errors that creep into the methods of daily country routine life.—EDS.]

SCIENCE AND PRACTICE.

PROFESSOR W. J. BEAL.

IN these times we hear a great deal said about "practical" men, especially by those who lay no claim to a good education. In the minds of certain persons, a thing is not practical, if they cannot understand it or put it in practice, or if they cannot see just how it will directly and immediately drop dollars into their pockets. A person may start out with a deficient education, work hard, and learn every thing by the severest effort, yet he may not be a very practical man after all. He will likely have some vague theories in regard to many things which he does not understand. These theories will more or less influence his modes of action. He will have many incorrect notions of the development and habits of insects and other animals. He will not understand some of the merest rudiments of plant physiology. On the other hand, there are some persons who possess much knowledge learned from books. If these are not careful, and have not tested their knowledge and have not learned much by experience, they may commit as great errors as the man ignorant of books.

I give briefly some examples which have come under my observation. The number might be much extended.

In case of plants, many errors are made and much bad advice given by those who are confused on the common names of plants. Any one can pick up or coin a common name, but un-

fortunately the same name is not applied to the same thing in all sections of our country. One tree is called Whitewood or Tulip-tree in Michigan and Poplar in the South, while there is another tree called Poplar in Michigan. Poa pratensis is often called Juno-grass in the North, while the same grass is called Blue-grass in Kentucky. Phleum pratense is called Herd's-grass in New York, while Agrostis vulgaris is called Herd's-grass in some parts of Pennsylvania. Some person inquires through the "Husbandman" about the hardiness of Buckthorn in the Northern States. He undoubtedly meant Rhamnus catharticus. A farmer in Michigan replies: "Oh yes, it is perfectly hardy and stands well along our roads and open places." The practical farmer probably meant Hawthorn, some species of Crataegus.

I knew a man who included himself among the practical men. He made an effort—a vain one, of course—to cause grafts of Chestnut to set on stumps or stocks of Horse-chestnut. A very slight knowledge of botany would have saved him all that trouble. A writer in a recent number of one of our first agricultural papers, complains that the roots of clover stop his tile drains. The drains he says, are 2½ feet deep, that the fibrous roots entered the drains, spread out into a fine, fibrous mass, and choked the drains, so that he had to take them up entirely, clean them out, and relay them. A correspondent replies and thinks number one must be mistaken, for clover roots run down not more than 12 or 18 inches, certainly not 30. And then he goes on to say that he has just dug some clover roots in deep mellow soil and finds none longer than 15 inches. The writer of this article has several times seen them six feet—72 inches—or over, straight down into compact red clay with a little sand here and there in streaks near the surface. He saw a student digging for the end of a clover root one day. He was then down six feet and had not found the end. Some writer in the United States Agricultural Report, said Buffalo-grass sent roots down but a few inches, while an experienced botanist found them down seven feet. A "practical" man was trying a remedy for a pear tree which had been struck with the blight. He bored into the tree to insert the remedy. He was careful not to bore into the heart of the tree, implying that he believed that part of the tree was very sensitive to injury. The fact is, that the heart of trees possesses very little, if any life, while the *liveliest* part of the trunk is the outside. A prominent nurseryman and author on Horticulture was applied to for some pollen of apple blossoms to be sent by mail for use in making a cross. He did not send any because he did not know how to collect it. The bees got the start of him. He had only to pluck the plump anthers from young flowers or buds just about to open, and send them in an envelope.

A "practical" man, so self-styled, recommended a liberal use of slaked lime in a hennery among the droppings of fowls. The objections are two-fold: the lime will liberate the ammonia which is a valuable fertilizer, and the ammonia is injurious to fowls.

Another man who boasted of his practical tact, did not need any surveying for him to lay a tile in a certain spot. He could lay it by the eye. The tile was laid and in one place did not work. It was afterwards surveyed when it was found that the tile ran in a way to make it necessary for water to run up hill over a foot above its level. The tile was taken up, relaid in a scientific manner and has since worked well. At a farmer's Institute, last winter, Dr. KEDZIE had just finished his lecture on some valuable chemical analyses of wheat and flour, showing their relative value. The man who succeeded him was to talk about exporting cattle to Europe. He began by saying that we would leave the theoretical and have something practical. He went on with his lecture, which, to say the least, contained some visionary ideas. We know two prominent men called scientific, who stated in papers that the mole could not eat vegetable matter. An account of some experiments, given in the RURAL not long ago, proved that at least one mole could and did eat cherries, soft corn, and potatoes. Additional proof could now be given of another mole—or two perhaps—which has twice "cleaned out" a nice lot of peas planted in a garden.

A beginner tried some experiments in the use of superphosphate on potatoes. He dropped a little in each hill. The plants which were not so treated yielded more than those where superphosphate was employed, probably because the fertilizer was not sufficiently spread or diluted. More than one practical farmer has fooled away his time in putting bands of cotton about his plum trees, or bottles of sweetened water in the limbs, all to attract, repel, hinder, or destroy the curculio. It is very common to hear wholesale approval of birds as friends to the farmer and fruit-grower, not even excepting the cedar-bird, and one of the sap-suckers, and the English sparrow. These, to say the least, must yet be shown to be a greater boon than a curse, if, indeed, it can ever be shown that they do more good than harm. The learned and unlearned may make some queer mistakes. Science with practice gives the best results.

Agricultural College, Lansing, Mich.

ROBERT BAKEWELL AND HIS WORK.

PROFESSOR I. P. ROBERTS.

IN 1726, ROBERT BAKEWELL of Dishley, England, was born. His early life was about equally divided between the farm and the school-room. At manhood he became possessed of several domestic animals, none of which approached in excellency his youthful ideal. Had he lived in our day, he might have gone to libraries and newspapers and have learned much of the successes and failures of his predecessors; but the past had nothing to give him. He was like a mariner seeking a new continent without the aid of the compass. True, he might have studied the most ancient book of the Bible and have learned that JOB, 2000 years before the Christian Era, had a thousand yoke of oxen, but of their quality or characteristics he would have learned nothing. Had he studied Homer, he might have learned in detail, how to fasten golden knobs on the horns of bullocks, but the art of producing a prime beefsteak at lowest cost Homer had not revealed.

Had he read Virgil's description of the cattle of the Romans, it would no doubt have increased his love for beautiful animals in the abstract, but he would have been as ignorant as before as to the methods by which the ungainly and angular animals about him were to be transformed into ones of beauty and value. Had he turned in other directions, the field was equally barren. Neither the Egyptian hieroglyphics nor ox-eyed Juno shed any light on the hard and unsolved problem. One other field is left from which to glean. Surely the artist whose highest aspiration it is to reproduce nature on canvas with the minutest exactness, will give some valuable hints as to the cattle of other lands and other times. But no; he is met at the very threshold with sadest disappointment; for he finds that nearly all the old landscape painters have introduced cattle scenes as accessories, and, with a view to lighten the beauty of the landscape by comparison, have grossly distorted and exaggerated the animals, thereby sacrificing truth for supposed artistic effect. BAKEWELL learned little of his matchless methods of improvement by beholding impossible, unshod, left-handed milkmaids, of twice the altitude of the cow, balancing on their heads two-quart pails while the poor cows' udders appear distended to a capacity that would satisfy the most grasping milkman even during a drought.

Thanks to LANDSEER and HERRING of England and PAGE and others of America, we now have the aristocratic Short-Horn and the fawn-like Jersey portrayed with admirable truth and fairness. Thanks to modern civilization which has wrought such changes that the honorable, the cultured and the wealthy vie with each other in the cultivation of these, save man, the highest types of animated nature.

Without guide or pattern BAKEWELL commenced his life of original work. His ideal must have been nearly perfect, judging by what he accomplished. He selects the best of his own herd and purchases from his neighbors the best of theirs. A portion of the offsprings he slaughters and dissects. The amount and texture of bone are carefully noted. The muscle is minutely scrutinized, not only as to its composition but as to its location; for it was well understood, even in that early day, that loin muscle was three times as valuable in the market as neck muscle. Next, the adipose matter was inspected to see if it was mixed with the lean meat, marbleizing the whole, making it juicy and palatable, or whether it formed layers on the surfaces, leaving the lean meat dry, tough and undesirable. How much information he gained by these tedious and continued experiments we are not informed; but certain it is, he soon learned one thing which appears hard for most of us to learn: that the half of the sum of two numbers is equal to the sum of their halves. To illustrate; supposing five to be the standard of perfection and we mark one parent four on this scale, the other three. Then the offspring—other things being alike—cannot exceed three and one-half. True, it is an improvement on one parent but the loss on the other equals it; there is no gain; we have simply equalized. And if parents are taken from this offspring, both being of a standard of three and one-half, their offspring cannot, of themselves, exceed this three and one-half standard.

There is much misconception as to selection or survival of the fittest. There could be no best or poorest, if the circumstances and surroundings were always the same. The offspring, however numerous, of two animals unaffected by the law of atavism, and always under the same conditions, would always be the same, as certainly as that a given weight will fall through a given space in a given time. BAKEWELL and his immediate successors learned the lesson well that like begets like under like circumstances; that Nature makes no mistakes and never sports but is ever true to the law of cause and effect. He discovered another law which has been formulated and called Prepotency. When this valuable quality had developed in any animal, he seized upon it as the means of *actual* improvement. Not believing it to have been produced without a cause, but only to have eluded his researches. In the illustration already given, if the parent marked four was prepotent, then the offspring might possibly reach a standard of three and three-fourths or even four; here is an actual gain of the average qualities of both parents, but if we follow this reasoning on and put it into practice, we find it a slow road to improvement, for this valuable quality can only be ascertained by results; the most discriminating judge being unable to detect it by outward form. Better food, care, and surroundings he soon found to be his main reliance.

But just as he appears to have learned the sure road to speedy success, he discovers another law, which asserts itself and frustrates his wisest plans—atavism, or ancestral influence, appears in many of the progeny. He finds that ancestors increase in each preceding generation in a geometrical ratio, and that the progeny is often not a type of its immediate parents, but has a portion, at least, of the possibilities of an innumerable ancestry; or possibly it may largely represent some inferior ancestor far down the line. Now, selection comes in play and separates those that have inherited the fewest objectionable qualities of their ancestors. But at first the number is very limited that escape this reversion to the inferior type. Had some of his neighbors improved their cattle to his standard, he might have gone on selecting and improving surroundings till he had finally eliminated the tendency to atavism. But this he could not do since all others were inferior to his own. Then how is he to reach his object? How arrest this constant tendency to revert to original types? The inferior blood that comes down with all the gathered strength of a hundred generations may appear he knows not when or where. He selects, with the utmost care, a few of his herd that appear to have inherited acquired tendencies, and to have escaped remote ancestral ones. This blood he concentrates by close breeding. Success crowns his efforts. The valuable acquired qualities are transmitted to the offspring, and the undesirable ones of remote ancestors are drowned out. He has established a breed excelling all others. So far excelling that lords and nobles flock to his unpretentious home to do him honor and learn the secret of his successes. Even the king makes him a visit to express his appreciation of his valuable labors and researches.

Though the rearing of cattle has been one of the chief occupations of mankind since the earliest periods, yet BAKEWELL was the first, so far as we know, to make use of any really scientific principles in their improvement. He learned that within certain limits he could produce any type or form of animal desired. Not by selection *per se*, but by taking advantage of variations caused by changed conditions. He who expects improvement from selection alone, will only meet with disappointment. Nay, more than this: the chances are about two to one that there will be deterioration caused by atavism or errors in judgment, in management, and in selection.

There has been a careful selection for the last hundred years of the cattle of the United States. The best animals are invariably saved and the poorest slaughtered; yet there has been no improvement except where improved blood has been introduced or the conditions have been bettered; and there never can be, for the stream cannot rise higher than its source. This one false idea entertained by the masses, has arrested improvement in domestic animals more than all others combined. Selection simply steps in and makes use of an accomplished result produced by a previous cause.

BAKEWELL died in 1795, and although he left nothing on record, yet his success was so great and attracted so much attention that his methods were well understood by many and put immediately into practice. CHARLES and ROBERT COLLING, THOMAS BATES and THOMAS BOOTH followed in his footsteps with the most happy results. In fact, they established another breed—the Short-Horns—that has attracted more attention than all others combined. Great credit is due to these last-named men for their skill and energy, though greater to BAKEWELL. But all of them will be remembered and honored as long as civilization endures, and long after the "Reform Politician" has been forgotten, the methods of these plain men will be studied with increasing interest.

Cornell University, Ithaca N. Y.

A FEW WORDS ABOUT SORREL.

T. H. HOSKINS, M. D.

THE writer lives in a sorrel country; his farm, when he bought it, produced more sorrel than anything else, and consequently he has had plenty of opportunity to study this interesting plant and learn its peculiarities.

An acute observer has said that "the obvious is rarely the true," yet among the things that nearest approach the impossible, without quite reaching it, the removal of a plausible error from the popular mind must be ranked high. As an example of this fact, I refer to the notion, contradicted by all experience and the observation of every farmer who does observe, that the growth of sorrel indicates "sour" land.. The warmest and sweetest soils are where the sorrel most luxuriates. Sorrel will retain its grasp of such soils even after their fertility has so declined by cropping without manure that few other plants will grow upon them. The sorrel will not luxuriate there, in such circumstances, but it will grow and overspread the ground, so that its red inflorescence can be distinguished at a long distance. These light sorrel lands are almost at once restored to fertility by the application of green sand, marl, or wood ashes, thus indicating that their special need is potash. But will the marls or ashes exterminate the sorrel? Very far from it. Unless the land is seeded with some crop able to overgrow and kill the sorrel, that plant, when dressed with ashes, will assume a most astonishing growth and luxuriance. A very slight experiment will satisfy any one that ashes, instead of being hurtful to sorrel, may be regarded as a special fertilizer for it. The two statements made above—first, that sorrel will take possession of and overgrow land exhausted of potash; and, second, that potash is a special fertilizer for sorrel, may be regarded as laughable inconsistencies; and certainly their mutual truth and inter-dependence do not rest upon their obviousness, to secure belief. Yet I will give an explanation regarding it which will satisfy any one somewhat acquainted with the principles of agricultural chemistry.

What is the substance that gives it's acid quality to the sorrel plant? Oxalate of potash. And what is oxalate of potash? It is a combination of oxalic acid with potash. The oxalic acid is native to and formed within the plant, by the union of its elements in the sap. But how does it get its potash? In a fertile soil, soluble salts of potash exist in sufficient quantity to supply the needs of all plants. In unfertile soils, rendered so by the exhaustion of the available potash, potash may nevertheless exist in large quantity in a form insoluble, or very slowly soluble, in the soil-water. From such a soil the oxalic acid of the sorrel enables it to extract potash by direct solution. Lime is also extracted in the same way. (See Johnson's "How Crops Feed," pp. 140-142.) The potash so taken up by the sorrel is sufficient for a moderate growth and the perfection of its seed, but not for luxuriant growth and leafage. But take a little patch of sorrel on such poor land, remove all other plants and keep them out—*i. e.*, weed your sorrel patch—and then apply a moderate dressing of unleached ashes, and see the demonstration of my statement that potash is a special fertilizer for sorrel.

How, then, does a free dressing of some potash fertilizer exterminate sorrel? Simply by promoting the growth of stronger plants, clovers and grasses, which are as weeds to the sorrel, and which when encouraged to grow freely by appropriate fertilization, smother it out. Applepomace, as narrated by the correspondent of the Germantown Telegraph, is a good application, because it contains a large amount of the organic salts of potash.

Orleans, Vt.

BOOKS RECEIVED.

RURAL AFFAIRS.—Luther Tucker & Son, Albany, N. Y. This book is well named. It *is* an Illustrated Register of Rural Affairs. Just those topics are touched upon which concern country people in their every-day life, and each topic is treated so as to convey in the plainest manner the most solid and valuable information. Thus, such subjects as "Country Dwellings, Improving and Planting Grounds, Fruits and Flowers, Domestic Animals, and all Farm and Garden Processes," are selected, and treated according to the best-known method, to the exclusion of the more theoretical views that may be considered as varying in accordance with individual tastes. It consists of 440 good engravings, illustrative of every subject in the text, and 350 pages. Mr. J. J. Thomas, the associate editor of that excellent farm journal, the Country Gentleman, is the author. The price is $1.50 by mail, postage prepaid, either for this volume or any of its predecessors, or $12 for the eight volumes, complete. We do not know of any similar work that, to the general reader who is interested in everything appertaining to the country home, is of more real value.

MANUAL OF THE APIARY, by A. J. COOK, Professor of Entomology in the Michigan State Agricultural College. Second edition, revised, enlarged, mostly re-written, and copiously illustrated. Published by THOS. G. NEWMAN & SON, Chicago, Ill. Among the numerous works on apiculture, we know of none so valuable to every practical apiarist as this handsome volume of 286 pages. Every point connected with the subject on which it treats, is handled in a clear, exhaustive, yet pithy and entirely practical manner. As we consider the work well worthy of a more extended notice in a later issue, we shall merely remark here that it should be in the hands of every apiarist who is seeking success by availing himself of the latest and best information on his business.

CATALOGUE OF THE UNIVERSITY OF NORTH CAROLINA.—This neat pamphlet of 64 pages gives full particulars concerning the institution to which it refers, including the names of the

Board of Trustees, the Faculty, and 160 students, and its praiseworthy benefactors. The nature of the studies pursued therein is also described, special attention being devoted to the department in charge of agricultural experiments, which has done so much for the advancement of the farming interests of the State. Of the extent of these services our readers have, from time to time, been indirectly informed by the incidental remarks of our valued correspondent, Professor Adolphus W. MANGUM, A. M., a member of the Faculty.

CATALOGUES, &c., RECEIVED.

CONNECTICUT AGRICULTURAL EXPERIMENT STATION.

NEW HAVEN, June 15, 1878.

Bulletin No. 16.—Fertilizer Analyses.

155. MANHATTAN BLOOD GUANO. Claimed 2 per cent. Nitrogen, 7 per cent. soluble Phosphoric Acid, 3 per cent. insoluble Phosphoric Acid, 5 per cent. "Alkaline Salts." Manufactured by Manhattan Fertilizer Co., 38 Platt St., N. Y. From stock of L. C. Sternberg, Hartford.

156. WARRANTED No. 1 PERUVIAN GUANO. Claimed 3.2 per cent. Nitrogen. Hobson, Hurtado & Co., N. Y. From stock of R. B. Bradley & Co., New Haven.

158. UPTON'S SUPERPHOSPHATE. Claimed 2.4-3.2 per cent. Nitrogen, 10-12 per cent. soluble Phosphoric Acid, 3-5 per cent. insoluble Phosphoric Acid. Manufactured by George Upton, 18 Broad St., Boston. From stock of E. Stiles & Son, Willimantic. Sent in June 7, by E. Stiles & Son.

154. GLUE SETTLINGS. From Works of Peter Cooper. Sent in June 4, by Geo. H. Glover, North Branford.

155 was sampled and sent May 2. 156 was sampled and sent April 8, by J. J. Webb, New Haven.

S. W. JOHNSON, Director.

QUARTERLY REPORT of the Chief of the Bureau of Statistics, showing imports and exports of the U. S., and other statistics relative to the trade and industry of the country, for the three months ended Dec. 31, 1877. Also for the corresponding quarter of the year immediately preceding.

EIGHTEENTH Annual Exhibition. List of premiums for the Oregon State Fair, at fair grounds, near Salem, commencing Thursday, October 10, 1878, continuing until Oct. 18; and the programme, rules and regulations of the same—reports of Committees and of the Secretary and Treasurer for 1877.

THE Annual Meeting of the American Association of Nurserymen, Seedsmen and Florists, will be held at Rochester, N. Y., June 19th to 21st. Headquarters at Osburn House. For particulars in regard to special rates, etc., address the Secretary, D. W. SCOTT, Galona, Ill., or T. S. HUBBARD, Fredonia, N. Y., Chairman Executive Committee.

THE HESSIAN FLY. A very interesting lecture by Prof. A. J. COOK of the Mich. Ag'l. College. Delivered at Farmers' Institute, at Paw Paw and Climax, Mich. It is sent pre-paid by mail for 10 cents, the cost of publishing and mailing.

CATALOGUE N. Y. State Agricultural Society. List of premiums and regulations for the Thirty-eighth Annual Fair to be held at Elmira Sept. 9—13. Entries close August 10.

SHEEP HUSBANDRY IN THE SOUTH. Prepared at the request of the Hon. Alexander H. Stephens, of Georgia, and others. By John L. Hayes.

LIST of Wild Plants of New England furnished by mail, post-paid, by ERASTUS S. WHEELER, Berlin, Mass.

PROCEEDINGS, Essays and Discussions before the Kentucky Hort. Soc., for the years 1877-'8.

TRANSACTIONS of the N. Y. State Agricultural Society 1872 to 1876; 532 pages.

AMERICAN VETERINARY COLLEGE. Fourth Annual Announcement.

TO MAKE APPLE TREES BEAR.

WE frequently see statements in the papers of inquiries if there is any way of making apple trees bear fruit on alternate years or every year.

Many years ago, a friend of mine had a dozen apple trees that were bearing heavy crops every other year. He wished to have fruit every year, so he took a very long pole—the trees were large—and gave them a heavy beating on one side, or half of the tree, just as the fruit was about the size of hickory nuts, knocking off every fruit on the south side of his trees. The result was, as I saw for a number of years, that these trees bore heavy crops on one side one year, and the next year a heavy crop on the other side, so that for many years he had plenty of apples for home use every year. His trees stood in a rich soil that was annually cultivated—no grass-sod to cover the roots. It is now about time to try the experiment. D. B. G.

TRADE continues good among the implement manufacturers. Aultman, Miller & Co., of Akron, Ohio, write us to the effect that their accumulated stock of New Buckeye Table Rakes was exhausted about the middle of May, since which time, although working a full force, full time, they are behind orders. This is as it should be. We hope they will have to work night as well as day.

THE self-acting cow milker, advertised by Stent & Co., in another column, is a useful invention. The simplicity which characterizes the machines themselves, and the thorough efficiency with which it is claimed the work is done, recommend them to dairymen and farmers.

THE LAST ACKNOWLEDGMENTS.

RURAL "Cricket" arrived save a week since. Goes well, gives entire satisfaction. Many thanks. O. B. B.

Lawrence, Kansas, June 8th, 1878.

THE RURAL is itself a gem, and the "Cricket" is just such a thing as we might expect from its liberal-minded management. R. S.

Ashland, Ohio.

"CRICKET" clock received all right. It runs nicely and keeps good time. It is very handsome. Many thanks for it. Hardly anyone here takes an agricultural paper. A. W. H.

Greenfield, Mass., June 10, 1878.

WILL not you receive subscriptions after July 1st for the RURAL, giving the "Cricket" premium? There are several who have promised me to subscribe for the last half of the year?

Paterson, N. J. C. S. S.

[Not after July 1st. This is positive.—EDS.]

WE received the clock you sent yesterday, and return you our thanks for so nice a present. We would not sell it for the price of the RURAL and "Cricket" if we could not get another. We set it going, and find it keeps exact time with our other clock, which is one of the best. H. J. W.

Camden, N. Y., June 12.

I HAVE only to repeat what so many have already said, that the "Cricket" is the most valuable present ever sent out for so small a sum, and, in connection with what we judge, the best family paper in the world. The RURAL grows better every week. O. A. B.

Cincinnati, Ohio.

"CRICKET" to hand far exceeds our expectations. It has had some pretty rough usuage at the hands of the children, but neither the fall JOHNNY gave it nor the soaking baby treated it to, seems to have in any way impaired its usefulness. It's the most accurate time-piece I ever owned.

Blue Grass Co., Ky. M. J.

I NOW return you my thanks for the "lively Cricket." Wishing to test its quality as a reliable time-keeper, I have delayed acknowledging its receipt. I will now say that the clock came to hand all right, that with a slight touch of the regulator it now keeps good time, and moves lively and true. I thank you for this valuable present. J. B. G.

Columbia, Pa., May 30th, 1878.

As I see the "Cricket" clock premium is to be withdrawn July 1st, I hasten to send for one more. As I understand it, the enclosed two names for six months each with the accompanying $3.50, entitle me to the clock. If I am mistaken, please correct me. The first clock I got was for two new subscribers and $5. That one has been very much admired, and as soon as I receive the second, I shall accept an offer I have had to sell it for $3.50. J. M. L.

Screven Co., Ga.

A WEEK'S trial has removed all doubt in the mind of the most dubious Thomas in this family about the punctual qualities of the "Cricket." It's always on time, not to the hour,—nor even to the minute—well, say to the half minute. I shall send for one more certainly, probably for two, and possibly for more before the end of the month. By the way, if my order is mailed here before July 1st, but reaches the RURAL office after that date, shall I fail of getting the Cricket as a premium? [No.—EDS.] W. L. M.

Milton, Florida, June 3d.

AFTER a journey of about 2,000 miles, the RURAL "Cricket" came to its new home here, nine days ago. Its long jaunt had slightly demoralized it on its arrival, but a little petting soon set it to rights, and now it correctly counts each passing second in a loud though cheerful tone. It looks so bright and handsome that one might readily imagine it has but little appreciation of the gravity of the lesson it is teaching with regard to the transitory nature of time and all things temporal. Many thanks, however, for the little preacher which is much more useful than many folks hereabouts think preachers can be. F. M. C.

Victoria, Texas, June 5th, 1878.

THE "Cricket" clock reached me safely considerably sooner than I expected to see it. It is a satisfaction to me to let you know that I am thoroughly pleased with it, though there is, I suppose, nothing new to be said in its praise. A prettier ornament or better time-piece I never saw, and the only effort it cost me was mentioning to two of my friends a few of the advantages to be derived from being a subscriber to the RURAL, and expressing my willingness to forward their subscriptions to you.

Accept my thanks for your generous premium.

Gage Co., Nevada. T. E. B.

WE are all exceedingly pleased with the "Cricket," and wonder how you can afford to be so liberal. After this month has passed, there will be many regrets from those who have not obtained one. Mr. Holdredge, Watch and Clock-maker of Newburgh, came over here and he was saying he had seen several of those pretty clocks and they were all good ones. I imagine you will need several car loads for the next two weeks. G. G.

Mountainville, N. Y., June 14th, 1878.

THE "Cricket" has created quite a furore in this quarter of the globe. Since its arrival (a week ago) the people (principally housewives), for miles around, have made pilgrimages to our house to impeach the much-talked of clock. One and all express themselves pleased with the beauty of the clock, and as I can and do vouch for its utility, there is a good prospect that you'll reap an abundant "Cricket" harvest in Venango Co., Pa. J. L.

The Swine-Herd.

MANAGEMENT OF PIGS IN SUMMER.

E. W. STEWART.

THE mass of farmers require some very strong preaching upon this subject. They seem to think the favorable summer season just the time to keep pigs cheaply, without any expenditure for food except the slops from the kitchen and a poor pasture. Their idea seems to be to increase the age without any regard to increasing the weight. They seem only desirous of pig frames to build on in the fall. This custom, almost universal until lately, of doing all the fattening in fall and winter, can only be accounted for by the fact that corn and the grain crops are ripened and ready for use in the fall, hence fall feeding was adopted for convenience or supposed necessity, without considering the strong objections to the system.

The cost of keeping up animal heat depends upon the temperature. During the six months from May to October, both inclusive, the average temperature ranges from 58 to 76°, and for the other six months from 29 to 58°, leaving a difference of temperature between the two seasons of about 30 degrees and the animal heat remains throughout the year the same, or 100 degrees. The animal must thus eat extra food sufficient in the cold season to overcome this large difference in temperature before any gain can be produced. Now, it will be seen that the difference between the average temperature of the air and blood-heat is twice as great in the cold as in the warm half of the year, and it will therefore require twice the food of respiration or heat production in the cold as in the warm season.

Experiments have shown that in very cold weather hogs would gain nothing upon the best feeding, if exposed to the open air. And this extra food required to keep up animal heat is all thrown away as compared with feeding in the warm season. It is quite below the fact to say that it takes 25 per cent. more food as a general rule, to produce 100 pounds gain in winter than in summer, unless the winter-feedings done in warm, well ventilated pens. It is most important that farmers should make the most of all their resources, and now, more especially, when farm products are so low. A farmer of the better class, who can make ten pounds of pork from a bushel of corn when the temperature averages 60 to 70 degrees, will find it more difficult to make 7½ pounds when the temperature is at an average of 40 degrees. From these facts it must be evident that the principal feeding should be done in the warm season. I would not advise feeding wholly upon grain, for the hog is a grass-eating animal, and it is doing violence to its nature to keep it wholly upon concentrated food. Many of the ills that swine "flesh is heir to" I think are caused by neglecting to feed sufficient fibrous food. Pigs should either have a good pasture or be fed clover and other green food in the pen.

When a pasture is not convenient, pigs may be soiled very profitably. An excellent way of feeding them in summer is to run green clover through a straw-cutter and mix an equal bulk of clover and corn meal together and allow it lie for 12 to 24 hours. The meal will absorb the moisture of the clover, swell and become softened, while both will so adhere as to be eaten together. From considerable experience in feeding after this method, I find the pigs uniformly healthy and more thrifty than when fed on grain alone. Good clover will do with half this quantity of meal, and sometimes produce equally good results. I have found even forty per cent. difference in favor of the clover and meal over the meal alone; and this, when dividing a litter of pigs and feeding one-half on corn-meal soaked in water, and the other half on clover and meal, giving each lot all they would eat. The pigs fed on corn meal alone were often feverish and mincing in appetite, while those on clover and meal were always lively and ready for a feed.

If pigs are on pasture then they should get also a constant small ration of grain. Grain will here produce much greater result than when fed alone. Pigs should be pushed through the summer with the most liberal feeding so that they may make a constant and rapid growth and reach a marketable weight of 250 pounds, or upwards, before December. A little grain used with pasture will always pay a liberal profit. There can never be a stand-still in growth without serious loss. Full feeding is the only consistent system.

Floricultural.

BULBS FOR THE FLOWER GARDEN.

W. C. L. DREW.

ERANTHIS.

IN quick succession after the Snowdrop, the earliest of vernal flowering bulbs, we find the Eranthis hyemalis in full bloom, with its wealth of golden blossoms. This is one of the prettiest as well as the hardiest of the dwarf spring-bloomers, thriving in any and all situations. It is one of the most valuable plants we have. In many situations the Snowdrop and Crocus will fail entirely, while in all such places the Eranthis can be planted with the certainty of a liberal reward of flowers. It is of a very dwarf habit; but for massing, or bordering beds it is splendid. A small bed planted very thickly—and whenever it is used it should be planted closely—will be one of the most attractive plots in a garden. The flowers are a very bright yellow and can be seen from quite a distance. The Eranthis is known as the Winter Aconite.

IXIAS.

The Ixia, belonging to the large family of the Irideæ or Cape Irids, is one of the most showy and brilliant of bulbous flowers in cultivation. In the Northern States they have to be grown in the house or conservatory; in the Southern States and in California, they grow in the open border with as little care as the Gladiolii.

In planting, in the two latter climates, having selected a situation with a southern aspect, where the land is a light sandy loam, make the soil rich by the addition of well-decayed stable manure, well incorporated; plant the bulbs in rows, having the rows ten inches apart. The bulbs should be set four inches apart in the rows; they may be set closer but they will not develop as well. Plant them two and a-half inches deep, making the soil firm around them. Water must be given freely when the flower buds appear; and, until after the buds and flowers are fully developed, the soil must not be suffered to get dry. If these directions are followed the Ixia will give to the planter more satisfaction than a Lily.

POT CULTURE.

In potting the Ixia, the same general treatment will be found satisfactory in all climates.

Six-inch pots, containing five bulbs, will give the best satisfaction. The bulbs should be planted during October and November, that a succession may be maintained for many weeks. Fill the pots as follows: Place in the bottom for drainage, a piece of potsherd laying over it an inch of coarse charcoal, then an inch of common sandy soil, over which an inch of well-decayed stable manure should be placed; then fill up the pot with equal portions of sand and leaf-mold or very light, rich loam. Plant the bulbs an inch deep in the pots, the soil being well pressed around them. Water freely and set the pots in a dark but warm situation.

After the plants appear above the soil, remove to the window or conservatory. They should be watered freely when coming into bloom and a few days before the blossoms open water with weak liquid manure. The flowers of the Ixia are very pretty and curious, nearly all the varieties having two or more colors represented in each flower.

During the last few years, the Ixia has undergone such wonderful changes in the hands of European cultivators that its old character has been entirely changed. The new hybrids are characterized by very large, numerous and highly-colored flowers, which have only to be seen to be fully appreciated.

El Dorado, Cal.

FICUS ELASTICA.—There are very few plants, cultivated for foliage alone, that answer so well for tropical beds out-of-doors during the warm season, and for sitting rooms during the season of frost, as Ficus elastica. A tree six feet high, may be kept in a pot ten inches in diameter.

The Querist.

ANSWERS TO CORRESPONDENTS.

Preparing Caterpillars by Inflation—A Natural History Cabinet—Pita-Wood, Etc.

A Reader, asks 1. how caterpillars are prepared by inflation. 2. a design for a Natural History cabinet. 3. what is Pita-wood and what is it used for. 4. where can a book, treating of the preparation of Natural History specimens, be bought.

ANS.—1. To prepare caterpillars by inflation the specimens must be dead, and they may well be two or three days old in death. Pushing the end of a knitting-needle into the hole at the hind end of the body, taking pains not to break the skin, the viscera may be stirred up. Then lay the caterpillar on a piece of paper or cloth which will soak up much liquid, and with a stick, round like a lead-pencil, rolled along the body toward the vent, press out the viscera. Begin not far from the vent, and press with caution, loosening the viscera more if they resist much. Then press from a little farther from the vent, and so on until the skin is emptied, and no specks are seen in it when it is held against the light. Then insert a straw, bringing the mouth of the hole close around it, by tying it with a thread if necessary, and inflate the skin. The skin must be thoroughly dried while inflated. For this purpose it is well to make an oven, as follows: Hang a long, tin box, such as a mustard-box, on its side, either without its cover or with a hole in the cover, cut large enough to admit the caterpillar freely. Place a lamp under the box, to heat it. While the skin of the caterpillar is kept inflated by blowing into it as strongly as is safe to prevent bursting or stretching, hold it on the straw in the box. When your breath gives out, remove the caterpillar from the box, so that it shall only dry while distended.

Being dry, it may be mounted by twisting a fine wire on a pin and pushing the two free ends into the hole, putting liquid shellac or glue on the wire to hold the skin firmly to it; or a pin may be thrust directly through the skin and through the straw inside of it. In the former case, the straw should have been inserted as little as possible and afterwards removed; in the latter case, it should have been thrust to the head and left in; in the latter case, be careful not to tear the skin, and it is well to thrust the pin through a very small piece of cardboard which is to be glued to the under surface of the skin. Mr. S. H. SCUDDER, to whom we owe the introduction of this method into general use among us, fastens his wire in the body, as above mentioned, but thrusts the outer end of the wire into a cork and keeps every specimen protected in a bottle. Hairy caterpillars must be soaked in alcohol at least half an hour and lie on drying-paper or cloth for two days, and must not be rubbed. Keep the skin clean.

2. Tightness is the first essential and darkness is the next, for a cabinet. Let the joint between the lid and tray of the box always be a flange if not a tongue-and-groove, The boxes should not be much longer than broad, and may be smaller for beetles than for butterflies. It is well for any one collector to have all the boxes of the same size: 48x40x7 cm. outside, is the approved size for museums, and about 35x25x6 or 7 or 10 for private collections, according as the boxes are to hold specimens in the tray only, or in both tray and lid. Glass-lidded boxes may be kept in a cabinet with closed doors.

3. Pita-wood is the flower-stalk of the "American Aloe" (Agave Americana). It has been used with great success as a substitute for cork, to make the lining of boxes for specimens of Natural History, where a wood easily penetrable by pins is wanted. It has been found to preserve the specimens in the box from mold when the specimens in cork-lined boxes were ruined under circumstances the same in every other particular. It has the additional advantages of being lighter and cheaper than cork. It is also used to make strong, coarse cordage, and in Mexico for the manufacture of paper.

4. A book of directions for collecting insects is sent by the Smithsonian Institution of Washington, for twenty-five cents. The Naturalists' Agency, of Salem, Mass., sells Maynard's Naturalists' Guide for two dollars. This latter book treats especially of the preparation of birds' skins.

Remedies for Roup in Poultry.

Silas Wright, Montcalm County, Mich., having within the last four years lost by roup fully 50 hens, but not a single cock, and having in vain tried several reputed cures for the disease, asks the RURAL to suggest some that may be more successful.

ANS. — Roup is frequently caused by wet weather, or cold winds, but it may also result if the fowls are long kept without food and water and then have an unlimited quantity of drink. Confinement, however, is the chief cause of the malady, especially if the birds are shut up in tainted coops. Here, as in other diseases incident to man and animals, prevention is better than cure, and precautions should, therefore, be taken against the first attack. When the fowls have become affected, however, the earlier they are treated the better, for it is generally a difficult task to effect a cure if the ailment has been permitted to secure a firm hold on its victim. If the eyelids be swollen, the nostrils closed, the breathing difficult, the discharge from the beak and eyes fœtid and continual, the cure is sure to be slow at best, and perhaps the best thing to do would be to kill the bird, if not a very valuable one.

In the early stages of the disease, however, a cure is generally easy. Keep the fowl in a warm place; feed it with soft food only, such as meal, mixed with hot ale and chopped vegetables, such as cabbage leaf. Wash the head, eyes, and inside of mouth night and morning, with dilute vinegar, or a solution of five grains of sulphate of zinc. In aggravated cases the following is highly recommended: Powdered sulphate of iron, half a drachm, capsicum powder, one drachm; extract of liquorice, half an ounce; make into thirty pills; give one at a time, three times a day for three days. TEGETMEIR, the great authority on poultry matters, advises the following treatment: Feed on oat-meal mixed with ale and green food unlimited, washing the head with tepid water, and giving daily one grain of sulphate of copper.

In all cases the affected bird should be promptly separated from the others, as the disease is very readily communicable, probably by droppings from the beak infecting the drinking water or food.

Flavoring Butter

J. D., Pittsburgh, Pa., asks whether there is any "Butter-Flavor," safe and good, for the purpose of improving butter.

ANS.—We know of no artificial "flavor" for butter. In a late issue we mentioned what is said to be the practice of a German farmer to produce this effect. It is said he hangs a bunch of sweet-smelling herbs in the churn just before churning, and their flavor is imparted to the agitated cream. Having never tried this, we mentioned it merely as a bit of news that might be of interest to some of our readers.

Make the butter clean from all foreign and noxious matter; work it as free as possible from buttermilk; salt it with salt liberated from chlorides of calcium and magnesium, such as any of the standard dairy salts, and you have the best recipe for flavoring butter.

Butter from New Milch and Farrow Cows.

Jacob Fisher, Steuben Co., N. Y., asks whether he will get as much butter by churning together the cream from new milch and farrow cows as by churning the cream from each kind separately.

ANS.—The cream from new milch cows often helps that from farrow cows to come to butter and to gather. We have known cases where a farrow cow's milk would not make butter alone, but mixed with that of a new milch cow, butter could be made from it. The globules are so small, or fine, that by themselves they will not unite readily, but will become attached to larger ones and so swell the mass of butter. It would be an easy matter for our correspondent to try the experiment of keeping a churning separate of the farrow cow's milk, and see what the result would be, but, generally, it is best mixed with other milk for the above reasons.

A Wet Cellar.

An old Rural Friend asks for the best and cheapest way to fix a wet cellar, which during some parts of the year, has a good deal of water in it; and he also inquires whether such a state of things is unhealthy.

ANS.—There is nothing to prevent water accumulating in such cellars as have loose walls, during long periods of rain, except a good coating of cement upon the outside *and floor* of the foundation. If the cellar is too low—too deep—then the floor must be covered with small, broken stones and puddled with cement (one part cement, two parts sand) to an even surface. If water still accumulates, drains must be laid to carry it off. Earthen pipes, four inches in diameter, are as permanent and cheap as any other effectual drain.

There can be no doubt that water in cellars is unhealthy. Of course it becomes stagnant very soon, and becomes favorable to the existence of many forms of low vegetable life and poisonous exhalations, known to cause various diseases.

Wants Silver-Spangled Bantam Eggs, Etc.

A Constant Reader, Nunda, N. Y., asks 1. where can he get eggs of the Silver-spangled Bantam; 2. the name of a cheap work on Taxidermy, and where obtainable.

ANS.—1. Write to Henry Hales, Ridgewood, N. J. 2. Taxidermist's Manual, by Capt. THOMAS BROWN. Also "Taxidermy," a volume of LARDNER'S "Cabinet Cyclopædia;" both of which works any local bookseller will purchase for a customer, just as cheaply and with less trouble than they can be got direct from the publishers.

Plants for Name.

L. R. Oneida Co., N. Y., No. 1. Kerria Japonica fl. pl. The variegated Kerria J. is desirable. The margins of the leaves are lined with white. No. 2. Silene pendula, a native of Sicily. No. 3. Geranium Robertianum (Herb Robert.) This is common north.

Miscellaneous.

A Subscriber, Bolington, Va., sends specimens of insects for name, and asks whether they will injure the wheat crop, and if so, how. (2) He, or she, also inquires why grain does not form on the lower part of a head of wheat which is forwarded.

ANS. —There were three crushed specimens of the tree-hopper (family Membracidae). We suppose, therefore, they must have been the insects inquired about. The habit of the family is to puncture twigs and stems and drink the sap; but we have never known any marked harm to be done by them.

(2) The cause of the seed not forming in the lower part of the spike, is owing to the lack of some manurial ingredient in the soil—probably phosphoric acid. Try manuring with superphosphate of lime.

Col. Curtis, writes us that he has white Turkeys This in answer to a question by a correspondent whose name we have lost.

NORTH CAROLINA NOTES.

WHEN I made my new plantation of small fruits last autumn, I plowed in a liberal application of manure from the horse stable, and soon learned that a mistake was made, as the ground was soon occupied with oats and weeds. I hoed this spring before the flowers appeared, yet there was enough seed left in the ground to produce another luxuriant crop. Either I had better have used rotted manure, or else applied it earlier in the summer, giving the oats etc. time to grow and be destroyed by frequent cultivation before planting time. However, I now have them pretty well subdued; all the fruit, but especially the strawberries, look fine.

Currants are cultivated to a very limited extent here, and as far as I can learn with poor success. This being my first experience with this fruit in North Carolina, I am unable to give any reason why it should not thrive where all other fruits flourish so finely. My plants are somewhat injured by borers, though not to any serious extent; but of the Currant-worm I see no indications, neither did I ever on my own bushes even when my neighbors' crops were wholly destroyed. This exemption can be attributed to nothing except that mine were always kept cultivated and weeded clean, while others allowed theirs to stand in sod with the additional protection, toward the latter part of summer, of a rank growth of weeds. Will some one versed in entomology tell us if thorough cultivation is known to be any protection? M. B. PRINCE.

RURAL SPECIAL REPORTS.

NEOSHO VALLEY, COFFEY CO., KAN., June 3d, 1878.

THIS is a very busy time for the farmers. Everybody seems to be rushing the work instead of letting the work rush him. We are having splendid corn weather at present, making it fairly jump, and promising a larger crop than in '77.

Wheat is ripe, harvesting commenced last week, and the promise of an extraordinary crop was never so encouraging. The fruit crop will also be very large.

New potatoes and peas in market on the 20th of last month—something unusual for this part of the country. Immigrants coming into the State run over each other in their hurry to secure a home in the "Eden of America."

Prof. Tice is our prophet, and we rely on him as implicitly as the good old farmers of New England on "Thomas' Almanac."

E. C. FIELD.

BROOKSTON, N. C., June 10, 1878.

WHEAT harvest has commenced, and a good average crop will be made. This part of the State will have wheat enough for home consumption the present year, and we hope to be able to make our own bacon next year, if not this. One cheering indication is that merchants are selling much less meat than last year. We have no more excuse for buying our bread, meat, butter and cheese, than we have for tolerating our numerous grog shops. Prices are for corn, 60c.; oats in the sheaf, 75c. per cwt.; eggs, 10c.; butter, 25c. for prime, and "as you can light o' chaps" for grease; tobacco, $1.50 for some small selections of flue-cured, down to one-half a cent for dark lugs. M. B. P.

DUNNSVILLE, Essex Co., Va., June 4, 1878,

HARVESTING wheat has fully commenced in the Rappahanock Valley. The growth of wheat is generally good, as is also the head, but the grain is very short and inferior and the product as far as heard from, can't be half a crop of poor quality. Corn is not looking well; we have through April and to date, had cold snaps and cloudy and rainy for very unseasonable weather. Hay very good. The fruit crop is good now, but it is falling off. R. S.

RURAL GROUNDS, June 15.

THE gray skies, rainy weather and cool nights following the frosts recorded have much interfered with many of our experiments, notably those with strawberries which, so far as flavor is concerned, it is hard to distinguish one variety from another. Crops of all kinds, however, are looking well though little in advance of previous seasons. The rye fields were never looking better. The grass is as green as grass can be, and the country altogether looks—to use a word which somehow we think ought to be monopolized by the gentler sex—charming!

BROWN CO., WIS., June 11.

WE are having good growing weather just now, and the small grains are beginning to revive and get over the cold and wet weather of early spring. Early planted corn is up and looks poor and yellow. Potatoes are looking well. We are putting in root crops and will next week sow millet. Sowing season with us lasts as long as there is growing weather, almost. Rye is in blossom in many fields, and where not winter-killed looks well. VAN.

CORRY, Erie Co., Pa., June 8, 1878.

THERE was quite a freeze on the night of the fifth, which cut things pretty badly on the low grounds. Potatoes and gardens had to suffer heavily, on the hills it hardly injured things at all. We are having a nice rain this morning, which makes things look splendid C. D. S.

BENNINGTON, Morrow Co., Ohio, June 11.

OUR fine crop of wheat is nearly covered with red rust. It is just in bloom. Other crops are looking well. Nights are cold with some frost occasionally. J. W.

The Herdsman.

STERILITY IN MALES.

IN most cases of impotence male animals on the farm are born all right, and only lose their power of procreation in consequence of living too high and not having sufficient exercise. Sometimes too, when very much inclined to lay on flesh, the animal becomes barren from want of exercise in the natural way, and accumulates fat so as to destroy all sexual inclination. I had two bulls which would never get stock when fat. One of them was from Sir CHARLES KNIGHTLEY'S herd, and yet afterward, when in store condition, he sired upwards of 200 calves per year and would have sired many more if deemed advisable, for as we always led him to the cows and only once, he did not do as much as one having his freedom and lying with 20 cows only, would do.

The other bull I did not possess at the same time, but he was at all times so injured by good feed that he lived entirely on the rough odds and ends of hay and oat straw and then he was literally like a "straw-yard" bull, which is an English saying due to the fact that a bull lying out loose in a straw yard is always more anxious than others to mate with cows.

The best stallion my father possessed got so lazy with mares, when he was nine years old, that he was worked daily at plowing and the work was beneficial, as he not only was always ready when wanted but there were fewer barren mares than when he was extra fat.

Having had a great deal of experience in breeding every variety of agricultural live stock, I have proved, over and over again, that all males are more vigorous for being freely employed, the only care required being prevention of repeated and useless jumping, and any farmer permitting a male to lie unrestrained with the herd or flock when a great many females have to be served, is devoid of proper judgment, and any one with clear common sense can see that these statements are true.

A bull can serve five cows to every single mare served by a stallion, and the number of ewes for which a ram is good, is double the number of cows which a bull can properly serve and ten times the number of mares a stallion should be allowed to cover; that is, if the ram is restrained like the horse. As all beyond one intercourse is useless, when a male is desired to sire a great number of animals he ought to be prevented from tiring himself to no purpose.

ONE WHO KNOWS.

WEANING CALVES.

HAVING weaned many hundreds of calves, and having 50 years ago fed them morning and night myself, I can say with entire confidence that after the first week, skim milk warmed a little more than new milk is when drawn from the cow, will keep them in good growing condition. There is no *if* or *doubt* about this fact, for many thousands are raised in this way every year, and have been for years out of mind, before my day in the county I was born in, and also, in the States for the last twenty years; while in Canada, they are treated just the same by hundreds of people.

About four quarts of sweet skim milk for the first few times is enough, as giving more will relax them too much sometimes; six quarts afterwards and, if it can be spared, more as the calf grows larger. In winter or early in spring the calves require feeding with hay, a very little at first, and, of course, it should be nice soft green hay and a little bran and oats or bran and meal—two-thirds bran will make them all thrive very fast. LAST DAYS OF THE CRICKET.

THE OFFER EXPIRES THE FIRST OF JULY, AND WILL NOT BE EXTENDED.

How to Secure an Elegant Time-piece without Cost and with very little Trouble.

ALL ARE PLEASED WITHOUT ONE EXCEPTION.

THE LAST NOTICE!

The Cricket for Two Yearly or Four Six-Months Subscribers.

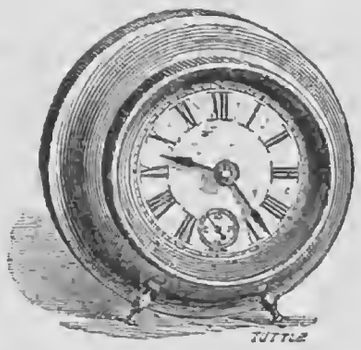
IT COMBINES THE BEST FEATURES OF BOTH CLOCK AND WATCH, And May be Carried from Place to Place in a Trunk or Valise.

We want the Rural Cricket Clock in the Home of Every Subscriber.

THE MOST BRILLIANT OFFER MADE BY ANY JOURNAL.

ECLIPSES EVERYTHING!

The "Rural Cricket" is inclosed in a beautiful circular metallic case of a single piece, and therefore without a seam. It is nickel-plated. The face of the clock is white and has a "second" dial as in watches. The works are securely inclosed so that no dust can penetrate and harm their movement. It is like a stem-winding watch, in that it requires.



NO KEY TO WIND IT!

and the hands are regulated without being touched. It runs thirty hours, is a chronometer-balance lever, jeweled, and it is guaranteed to keep as accurate time as the best watch.

IT RUNS IN ANY POSITION,

on its face, on its back, standing up, lying down, on its side, in short, in any position.

SIMPLICITY, ELEGANCE, DURABILITY.

It may be secured without any more effort than is required to tell its merits to a friend or so, and a sample clock will enable anybody so inclined to dispose of hundreds in a week.

THE OFFER.

FIRST.

Two New Subscribers

secure the clock! The lowest price of the RURAL NEW YORKER, except in clubs, is $2.50. Therefore upon the receipt of $5.00 and two names the sender is entitled to ONE "RURAL CRICKET."

SECOND.

We will send the RURAL NEW YORKER for one year and the Cricket Clock to any one upon the receipt of $3.50.

THE VITATIVE COMPOUND,
Or Seed and Plant Invigorator.

The greatest discovery of its kind of modern times, for increasing the vital force and early maturity of Seeds and Plants. Patented April 21, 1874.

Early Maturity, Sure Crops, Large Yields, and
DESTRUCTION OF INSECTS.

Better than Guano or Plaster, at a fraction of their cost. The Compound is applied directly to the seed before planting, and its chemical properties insure speedy and certain germination, and by creating an artificial warmth aid the young shoot in its first stages, completely overcoming the dangers incident to wet, cold or late springs, and at the same time protecting the seed and shoot from the ravages of worms or insects. Put up in neat packages of three sizes—the smallest sufficient for a peck, the medium for a half bushel, and the largest for a bushel of seed. Price 50 cents, $1 and $2 respectively. Sent by mail or express on receipt of price.

EXPORTATION OF LIVE CATTLE.

JUST as we begin to realize the possibilities of the live cattle trade with Great Britain, a bill is brought before Parliament to cause all these animals to be slaughtered at the wharf where they are landed. And, although the measure has, for the present, been defeated, it is by no means improbable that jealousy of foreign competition will hereafter prompt the agricultural interest of Great Britain to advocate legislation of a similar nature. There can be no doubt that the English people fear the effect of our competition much more than they fear the importation of contagious diseases; still they have a very convenient excuse for adopting a measure that will virtually stop our exports of live cattle. If our Government were only alive to its responsibilities, if contagious diseases here were made the subject of proper sanitary regulations, if affected animals were isolated and destroyed, and proper disinfection practiced, this excuse would no longer exist, and we could make such representations abroad as would give our cattle the freest entry in any port in the world. The representatives of Canada, it appears, have been able to show that their stock is free from disease, and, as a consequence, their cattle have been allowed to go to any part of the kingdom. On our part, there seems to have been nothing done to preserve our privileges in this respect; indeed, it is difficult to see how a case could be made out in our favor while the present know-nothing, do-nothing policy of our Government is continued.

We have long been apprehensive that our exportation of live cattle would be stopped, sooner or later, in some such way. We have had contagious pleuro-pneumonia domesticated among us for more than thirty years, and during this time it has been spreading in every direction until now no one is able to say where it exists and where it does not. Our government has made no effort to check its extension, nor even to collect information of its progress; and as no one in our own country can make any pretense to knowing what danger there is of its exportation, we can scarcely expect the English to know more. England has already lost over $500,000,000 from the ravages of this disease; her experience was dearly bought, and she cannot be blamed for providing against its future introduction by any reasonable measure.

Both our people and government appear to be totally oblivious of their duties in regard to such plagues, and apparently nothing will be done to check them till severe and repeated losses demonstrate the necessity of such measures. Pleuro-pneumonia is the most dangerous of all this class of diseases, as three or four months may elapse between exposure to the contagion and the appearance of the first symptoms, and as the disease may be communicated during a considerable part of this period, we can see how readily an animal might be taken to England and driven over many miles of that country, spreading the germs of this disease wherever it went, and finally be butchered before any symptoms of pleuro-pneumonia were apparent. Again, some animals may have the disease in a latent form, never showing any symptoms whatever, but still are as dangerous as the plainest cases.

These facts show that the fears of the English people are not entirely groundless. We have pleuro-pneumonia among us—it may not yet have reached the herds, or even the sections of country from which animals are drawn for exportation; but who knows how soon it may appear there? Or who can positively assert that all of such herds are even now free from it? It is said that a recent outbreak at Clinton, N. J., was caused by a cow brought from Ohio; did our government, or any individual outside of the infected district, suspect that pleuro-pneumonia existed in Ohio before this fact became known?

We do not wish to excite needless alarm, or to overestimate the danger from this disease; but we have a duty to perform in regard to it, and we cannot see that anything is to be gained by trying to convince ourselves, or the English people, that no danger is to be apprehended from any disease existing in our country. We cannot, therefore, agree with those journals which think our government should make such representations abroad as would give our cattle free entrance into the British ports; it is the plain duty of our government to make sure that such danger does not exist before asserting that this is true. If the destruction of our live cattle trade proves sufficient to awaken our people to the necessity of stamping out contagious diseases on their first appearance, and of making such regulations as shall prevent their spread, the loss will be more than counterbalanced by the gain.

MEDICAL EDUCATION.

WE printed in the RURAL last year an article "How Doctors are Made," in which we endeavored to show that even under the most favorable circumstances, and with the closest attention on the part of both student and instructor, it would be next to impossible for a majority even of a class in a medical colleges to obtain in the three years' study the law requires, sufficient knowledge of the many difficult branches of medical science to entitle them to a graduation and legal permission to practice the healing art. We believe there is a tendency in the right direction, but its effect is not yet very apparent. One college in New York at its last commencement, of a class of more than a hundred, graduated all but six—and this college ranks with the first in the country.

Our thought was turned to this matter by a recent statement in one of our daily papers that of twelve students of law who applied to the board of examination, for certificates of approval, only seven passed a satisfactory examination. Are we to infer that these applicants were less intellectual or less studious than medical students in general, or that the examiners in the law are more strict than those of the medical schools? One who has had experience or opportunity for observation, would decide that question readily. It is time the public took the matter of educating physicians into consideration. We entrust the lives of ourselves and of our families in their hands, with no other guaranty of their ability, than their diplomas, and we should see these diplomas are not granted to those who are not entitled to them. It would be supposed that a more thorough examination should be made of the qualifications of him to whom we entrust our lives, than of him who takes care and guardianship of our property. Let us see how it is: The law requires that a medical student shall have been under the instruction of a respectable medical practitioner three years, and that he shall have attended two courses of lectures in some medical college, established and conducted in conformity with the laws of the State, and shall pass a satisfactory examination by the faculty of the college he last attended.

It will be noticed that no examination for qualifications is made on entering medical colleges—and the time spent with the instructor may or may not have been well employed. At the end of the lecture term the examination is held. The inducements to pass the students are these: The faculty, being as a rule permanently connected with the college, divide the profits thereof, consequently it is for their interest to have large classes. They are not anxious to drive scholars to other institutions through fear of severe examinations. Beside, there is a fee paid by each student graduated, in addition to his other college expenses.

Let us look for a moment at the requirements of the law student in this State. A board of examiners is appointed each year by the Supreme Court for each district, to whom applicants present a certificate of some practicing attorney to the effect that the bearer has been studying in his office, under his direction, at least three years. If successful in passing the examination of the examiners, the applicant is admitted to practice law as an attorney. In this capacity he gives advice, and prepares cases, but is not entitled to present them to the courts. After two years of this practice an attorney can present himself for another examination which, if successful, entitles him to practice in the courts as counsellor. It takes a man five years to become qualified to manage a law case in which your property is involved. Three years is considered sufficient for him who has your life in his hands. If the lawyer makes a mistake in his management it is easily seen and his reputation suffers in consequence. For the physician—dead men tell no tales—and his errors are too often charged over to the inscrutable ways of Providence. Every man in the State should make this matter of medical education a personal one. Once set the question prominently before the public and it will not rest until the standard of qualification for medical practitioners is raised. No physician should be allowed to practice who has not had at least two years experience in hospital, or under direction of a practicing physician.

Worse things could be done with public money than to establish a free medical college in each State, from which none but thorough and well qualified students should be graduated.

NOTES.

Teaching children to pick things up.—We know a man who is quite particular about keeping every thing in its proper place. We heard him say, that he acquired this habit through the training of his mother. When a boy even as far back as he could remember, his mother always made him pick up and put away his playthings after he had got through with them. He was often allowed to get out all the materials he wanted for a good time. In bad weather the kitchen was often at the disposal of himself and brother, but they always understood that every thing was to be cleared up at the close of the play. No doubt there is a difference in children, for we have known boys of the same family, of nearly the same age, brought up in all respects as nearly alike as possible, yet one of them was always careless, and became a careless easy man, while the other was extremely particular in all the details of his dress, sports, and work. Still, granting this difference which many would call a natural difference, we believe a persistent training in early childhood would make an orderly man out of the most careless child.

What kind of Help do you hire?—Generally, one of the first requisites is faithfulness in performing work. This is well enough as far as it goes. A clear bargain is made as to the rate of wages, duties to be performed, and the length of time. We wish to call the attention of farmers to another point in this matter, which is too often neglected. What are the habits of the man employed? Is he temperate? Does he use tobacco? Is his language free from profanity and every thing which is vile or indelicate? If you have any young boys or older boys, they will very likely associate much with the hired men. The men are older and stouter and can do many things which the boys are unable to perform. The boys will imitate the vices of men as well as their good qualities. If you have daughters, it is scarcely of less importance that the hired help possess the good qualities above mentioned. Good habits and good morals are of great value. A young man who possesses them is of priceless value when compared with one who does not.

BREVITIES.

OUR readers are promised a series of horticultural articles by RENOCLAF, to extend, it may be, through the rest of the year. We leave these articles to speak for themselves.

AWHILE ago we complained that sparrows eat our strawberries. We find that robins eat them too. But we had rather that the robin should eat half-a-dozen than that the sparrow should eat one. The robin earns its living—if not by devouring insects, by its pleasing notes—its decorous behavior and comely looks. We had as lief part with strawberries as with robins. But the sparrow is among birds what tramps are among men.

WE respectfully announce that the Rural Cricket Clock will be withdrawn as a premium on and after the first day of July. It is now apparent, if it has not been from the beginning, that this clock is all that it was represented to be. The compensation that we have is that all who have received it have been well pleased. As a method of obtaining new subscribers it has been an actual loss to us. Our free seed distribution for the present year will be announced as soon as we can estimate the probable crop of seeds.

THE Scientific American publishes the following on neutralizing poison:—"A poison of any conceivable description and degree of potency, which has been intentionally or accidentally swallowed, may, it is said, be rendered almost instantly harmless by simply swallowing two gills of sweet oil. A person with a very strong constitution should take nearly twice the quantity. This oil, it is alleged, will most positively neutralize every form of vegetable, animal, or mineral poison with which physicians and chemists are acquainted." This is of inestimable value if true. *Who* says it, and how does he know?

THIS is just the season of the year when city people begin to think about how much they esteem their country friends and relations. It's a peculiar kind of esteem—an ardent affection, in fact, that burning intensely through the summer season, burns itself out by fall. But a smoldering spark is always left that, by nursing through the next nine months, is ready again in June to burn up as brightly as before. Conversely, however, country people love their city relations and friends best in winter, and, spite of all the ironical things said about it, the interchange of courteous hospitality is quite natural and sensible.

SOME years ago a son of the late Baron LIEBIG asked Mr. J. B. LAWES of Rothamsted to furnish him with samples of the soil of a certain wheat field, and the result of his analysis established the fact that manures, such as phosphoric acid and potash, remain in combination with the soil, very close to the surface. As all manures are applied either to the surface of the soil, or a few inches below it, we may consider that if they contain potash, phosphoric acid and nitrogen, as is the case with farmyard manure, the two former will remain close to the place where they are deposited, while the nitrogen, as it becomes converted into nitric acid, will diffuse through the soil, where part will be arrested by vegetation, and part will escape into the subsoil and drains.

THE "RURAL NEW YORKER."—We notice with pleasure the recent enlargement of the RURAL NEW YORKER as an indication of present prosperity and a progressive spirit. This paper has seen troublous times, and we are glad it has reached calmer waters. Its present editor has our admiration for the reviving work he has accomplished.—*Pacific Rural Press.*

[Liberal-minded journals like the above seem disposed to give the present editors of the RURAL NEW YORKER more credit than is really their due. The truth is, as we have before stated, the RURAL has never seen such "troublous" times but what, had it been conducted with any sort of management, it would have paid a handsome yearly income beyond its expenses. Its present success is due, therefore, just as much to a reduction of needless expenses, as to any improvement in the paper, increase of circulation, or advertising patronage.—EDS.]

Professor BEAL gives the following reasons in brief for cutting grass early. Stock of all kinds prefer young grass to that which is in the flower, and that which is in flower to that which is older or has gone to seed. He believes the same holds true of hay or grass deprived of most of its moisture. We should make hay early: 1st. Because all kinds of stock like it best. 2d. Cut it just before the flowers appear (or before full-blooming in clover), because the chemist finds at that time the grass contains a greater proportion of nutritious or digestible materials than when cut later. 3d. This plan leaves a longer time for the next growth, which may be used for pasture or for mowing again. 4th. It exhausts the roots of the plants less than when cut later. The English found, long ago, that one great cause of the deterioration of meadows was that of allowing grass to get too old before cutting. 5th The crop may often be cut at this time and secured in good order, while if the owner waits for the coming of the flowers, bad weather may interfere. 6th. If only a part is cut early, some portions will likely get into flower or even go to seed before it is secured.

Literary Miscellany.

THE COMING OF THE GRASS.

WHENCE cometh the grass—
The sudden secret grass?
From what deep world invisible,
What subterranean citadel,
What army of elfin-land,
Comes forth that swiftly-marshalled band,
That vision of unwarlike spears,
Innumerable as the heavenly years?

How cometh the grass—
The irresistible grass?
We know not how, we cannot tell
The moment of that miracle;
We know not when, we know not how;
We know the earth was bare, and now
That pleasantly our footsteps pass
Above the yielding emerald of the grass.

Where cometh the grass—
The all-abounding grass?
Along the hills, the meadow sweet
The river side, the village street;
In forest nooks its tassels wave;
Its patient green enfolds the grave;
Beside the cottage home doth press
The tender, faithful grass with mute caress.

Why cometh the grass—
The bright, untiring grass.
That down the ages doth repeat
With every year its idyl sweet?
To teach the truth declared for thee
By gracious lips in Galilee:
"He careth." Then when doubts harrass,
Heed thou the wise, soft whispers of the grass.

[Illustrated Christian Weekly.

CORA.

CHAPTER XXIV.

(Continued from page 381.)

THE next day they returned to Paris, and were greeted at the entrance of the hotel by the obsequious Mr. Marks, who a few days later gave his master formal notice to leave. His savings and a small legacy lately received enabled him to leave service, he said; and Sir Alan's mind was too much occupied with other things to take much notice of his profound regret at leaving such a master, nor had he the faintest idea that the legacy of which he spoke was a cheque received from Lord Almane, in return for services rendered by the faithful and attached domestic.

Thus it happened, that when Sir Alan and Lady Vincent returned to England, Spills was the only attendant they had with them, although Cora saw at the station the cold blue eyes and evil face of her husband's late servant, and even that transient glance made her shiver and draw nearer to Sir Alan.

"That man is my evil genius," she said, pettishly; and Sir Alan glanced at her in some surprise.

"I beg your pardon," he said, coldly. "To whom are you alluding?"

"To Marks," she replied, timidly, coloring at her momentary agitation. "I have had nothing but misery since I saw him."

"You are fanciful," was the quiet reply, as Sir Alan opened his newspaper and settled himself in his corner, nor did he speak again during the journey, except to ask whether she were cold, or when they stopped, to inquire if she would take any refreshment.

Lady Vincent and Marianna were at Rivington Square to welcome the travelers, and a very few minutes sufficed to show the elder lady that something was wrong between her son and daughter-in-law, and that something had destroyed the perfect confidence which had once existed between them. She saw that her son looked ill and haggard, that Cora, notwithstanding a forced gaiety, was the ghost of her former self, and evidently unhappy; but as days passed on neither volunteered any explanation, and she returned to the Bungalow much disturbed, and anxious in the highest degree; but hoping almost against hope, that the old love would reassert itself again.

At Christmas she paid her usual visit, and found that things had by no means improved. Sir Alan's manner, so haughty, imperious, and cold, pained her terribly; while Cora seemed so reckless and defiant that she could hardly recognise her as the same person. One thing about her seemed unchanged, and that was her devotion to the child, whom she seemed to idolize. He was a bright, handsome little fellow, with shining dark-gray eyes, shaded by long dark lashes, the counterpart of his mother's; while in shape and stature he seemed to have inherited the stately proportions of his father. But strangely enough, the child was more attached to Sir Alan than to his mother, whose passionate caresses and fierce love seemed to frighten him; and the tears came often into Lady Vincent's blue eyes when she saw Cora turn away from her husband and her boy with a yearning misery in her eyes, which told of sorrow unutterable. When he was playing with his son, the sorrow would be lifted from Sir Alan's brow, the gay smile appear upon his lips; and when Harold, wearied with a long game of romps, would fall asleep with his long curly head nestling against his sculptor-father's silken beard, Sir Alan's face would become beautiful with the expression of protecting tenderness which illumined it. And Cora, looking on, felt like Eve banished from Eden, and turned away, clenching her little hands to stifle the cry of agony which rose to her lips.

Deprived now of all domestic happiness, it was but natural that Sir Alan should devote all his time and energy to his profession. He passed long hours in his studio, and if he missed his wife's presence, he never, by word or look, betrayed that he did so.

Cora walked, rode, and drove as usual, appeared in society with a smiling face and gay demeanor, and Mrs. Grundy, acute as she is in general, failed to detect any skeleton in the sculptor's cupboard, although a more miserable woman rarely hid her wretchedness under a smiling mask than Cora Vincent.

Sir Alan's house was a favorite resort of talented and rising men of every profession, while the "upper ten" delighted to go where the lions of the day could be freely discussed and "interviewed." On two evenings in the week Lady Cora was "at home," and on these evenings the drawing-rooms were filled with aristocratic and distinguished visitors, who in their turn courted and "feted" the sculptor's beautiful wife. On these occasions, Sir Alan's courteous and chivalrous deference to his wife never altered; he introduced his new friends to her; was cordial to her; and the guests said that they were a "model couple," and wondered a little that their Bohemian tastes, which were sufficiently *prononces*, allowed them to give such an example of conjugal felicity.

Among these guests was one, however, who saw things more clearly, and who partly guessed how matters were. This was George Leeson, who, as a friend of Harold Sinclair's, had retained a warm interest in his sister. He was too indolent himself ever to reach the top of the tree in his profession, and had never married, entertaining, so rumor said, a hopeless passion for Lady Lucie Belmont, who, though she had returned to England and mixed in society, was still Lady Lucie Belmont, and retained undivided control over her broad acres and golden guineas. She and Cora met sometimes, but the old friendship of other days had not been renewed. She, as well as George Leeson, thought Cora had married Sir Alan out of pique at Lord Almane's neglect, for the Viscount's love for Miss Sinclair had not remained a secret to the heiress, who had set him free on learning, by that chance conversation overheard at Mrs. Colston's, that Cora was preferred to herself.

One evening, after an unusually brilliant assembly at Lady Cora's, when but a few intimate friends remained, Mr. Leeson approached, and sat down in a low chair by Cora, who was sitting a little apart, and at a sufficient distance to prevent any conversation being overheard.

"You are tired, Lady Cora," he said, gently.

"No," was the listless answer.

"Then will you come and show me that new orchid Lord Travers has been raving about? I want to speak to you," he added, as she hesitated, and something in his manner constrained Cora to rise and take his proffered arm.

They passed down the room into the conservatory beyond, and George Leeson made Cora sit down, and took a seat beside her.

"I am the bearer of a message and letter to you," he said, quietly. "I do not think I am wrong in delivering it. It was given me last night by Stanley St. Roger, and this morning I heard—my news will shock you, Lady Cora—so be prepared."

"You heard what?" she asked, quickly.

"That he left England last night, and that he did not go alone. That Lady Helen St. Maur accompanied him."

"Her husband, her poor children!" said Cora, looking very pale and shocked. "Oh! how dreadful!"

"It is very sad," said Mr. Leeson, quietly. "I am an old friend, Lady Cora, may I take an old friend's privilege? Had Lord Almane anything to do with the present uncomfortable feeling between your husband and yourself?"

"He may have had. Yes, in a great measure, perhaps; but you, who know that Alan never loved me, must have known that his feigned devotion could not last," she replied.

"I who know that he never loved you?" said Mr. Leeson, in surprise. "What do you mean, Lady Cora?"

"I saw my husband's letter to you," she went on, in a dreary monotonous voice, "the letter in which he said that 'out of pity for my lonely position and evident *penchant* for himself he was going to marry me.'"

"You are dreaming, Cora," said her companion. "Do you not know Alan Vincent better than to imagine him capable of such a thing? He never wrote those words in his life to me. Why, I have his letter still, the one he wrote in reply to my congratulations; and short as it is, it is easy to see that he loved you dearly when he thanked Heaven for giving you to him. Who showed you the letter, Lady Cora?"

"Lord Almane," she said, tremulously; and then, unable to repress her desire for a friend, she told him all that had happened in Paris, without any reservation or concealment whatsoever.

He listened with deep attention, and heard her in silence to the end.

"There is some conspiracy here," he said then. "There is some underhand business which we must discover, Lady Cora. You were all duped—you, your husband, Lord Almane himself. Depend upon it," he added, impetuously, "whoever forged the note from you to Stanley was the writer of the letter porporting to come from Sir Alan. Take courage, my poor child, all will come right yet."

She shook her head sorrowfully.

"I have given up all hope," she said, in her sad, sweet tones. "He will never believe in or love me again. Circumstances were against me, I grant; but it was easy to make him doubt. No; he never really loved me!"

"His was jealousy in love, Cora," said George Leeson, cheerily. "Trust me, all shall be well yet; and when you have him at your feet again you will forget all your trouble in the joy of that 'reconciliation which is the feast of love.' But I must go," he concluded; "and I am forgetting my commission."

He took from his coat pocket a sealed letter, which he handed to her. As he did so, Marianna appeared at the entrance to the conservatory, and, as Cora concealed the letter in the little embroidered pocket suspended at her waist, she came eagerly forward, her old, wrinkled face showing signs of terrible perplexity and distress.

At the sound of her footstep Cora turned, and seeing the troubled face, rose from her seat. The old servant seemed in the utmost excitement, and began a hasty explanation in her own language, which she always used when distressed. George Leeson was but an indifferent Italian scholar, and he had distinguished but one word, *bambino*, when Lady Cora uttered a faint cry, and rushed away, followed with almost equal rapidity by the old nurse.

CHAPTER XXV.

"Oh! doctor, save him, save him to me; he is all I have in the world."

"Dear Lady Cora, how gladly would I do so, but your dear child is beyond all human skill."

And the kindly, gray-haired physician, who had a young married daughter and a little grandson of his own at home, felt his eyes fill with water at the passionate sorrow in Cora's tone as she implored him to save her child.

Some three or four hours had elapsed since Marianna had summoned Cora from her interview with George Leeson, and they had been passed in terrible anxiety and suspense; but it was over now. There was no need now for anxiety—no need for suspense; as the gray dawn had broken over the eastern sky, Harold Vincent's fair soul had fled, and the form which lay clasped to Cora's breast was no longer living or breathing, but a form of lifeless clay.

All the efforts of the physicians who had been summoned in all haste, had proved unavailing. The child had been attacked by the most terrible species of croup, and after a few hours struggle with death, had passed away with a smile on his face, and a sweet upward glance of the gray eyes at his father's mournful face as he bent over him in speechless grief.

"Hush!" said Cora, hastily. "He is better; look, he is going to sleep. He is not suffering now."

No, he was not suffering; he would never suffer again. The sleep of which the poor young mother spoke was the sleep of death, and one glance at the grave faces of the medical men showed Sir Alan that it was so.

But Cora did not know it; to her the stillness of the little limbs, the sudden peace which had fallen over the little face, were not signs of death, but of sleep and freedom from pain; and she looked up at the physician with a faint little smile and a prayer in her eyes that he should confirm her hope.

It was a strange, mournful sight, that silent, solemn group gathered round the fair young mother and the dead child. Cora still wore her evening dress of gold-colored silk and lace, which looked strange and out of place at such a scene, and by the morning light; diamonds were gleaming on the rounded throat, in the little ears, and on the slender arms which clasped her child; the flowers in her hair had faded, and her graceful head was bowed over the little lifeless form. Sir Alan stood beside them, his face bearing an expression of anguish, and the two medical men stood apart, talking in under-tones; while Marianna was kneeling by her mistress, tears falling over her wrinkled face.

"Why do you cry, Marianna?" said Lady Cora, softly. "He is better now; but he is cold," and she gathered the child closer to her breast. "Give me a shawl to cover him. Why do you look so grave, Dr. Grayling? Harold is better."

"Yes, he is better," said the physician, gently. "He is quite well, Lady Cora. My child, he is freed from all pain and suffering now, and you, who loved him so dearly, would not wish him back."

Cora lifted her eyes to the grave, gentle face which bent over her, with a vacant gaze of terror.

"What do you mean?" she said, piteously. "Harold is better, is he not? See, he is so quiet. He could not lie so still if he were suffering."

"Neither does he suffer, my poor child; he will never suffer again. Let me take him from you."

But she drew him closer to her and clasped the white jeweled arms more tightly around him. Then she rose and stood upright with a faltering, uncertain movement, which made Sir Alan put his arm around her to support her.

"You do not mean that he is dead?" she wailed forth. "Oh, Doctor Grayling, he is all I have in the world. Save him to me—save him to me!"

"He is past all human skill now, Lady Cora. Your little son is dead."

As the words came slowly and unwillingly from the doctor's lips, Cora uttered a cry of anguish; then, stooping, she pressed her lips again and again passionately to the cold brow and closed eyes, and, parting the curls from the child's forehead, she cried out:

"It cannot be! Heaven would not be so cruel. I will not—I will not let him die!"

"Hush, Cora!" said Sir Alan, gently removing the boy from her arms and laying him on the little white cot. "Our little one is happy now; I loved him too, you know, and yet I am willing to give him up when it is for his good."

She looked up at him vacantly, but said nothing; Sir Alan encircled her with his arms, and held her tenderly within his embrace. It was long now since his lips had touched hers, and even in his anguish and bereavement a thrill passed through him as he bowed his head over her, and touched her brow with his bearded lips, murmuring some tender, pitying words. Cora stood still and motionless for a moment, watching Marianna, who, with tender hands, had laid the child on the bed, straightened the little limbs, and folded the little lifeless hands upon the breast.

When all was over, Cora disengaged herself quietly from her husband's arms, and moved with an unsteady, faltering step towards the bed.

Then she stooped over the child, pressed a long, long, lingering kiss on the baby mouth, and left the room with the same mechanical movement, the same stony glare in her dark, lustrous eyes.

"I need not say how deeply I sympathize with you, Sir Alan," said Dr. Grayling, as he prepared to take leave. "Poor Lady Cora!—it is a terrible trial for you both. I will call in the course of the morning to see how she is."

"Thank you," said Sir Alan, quietly, as he went down-stairs with the physicians, returning almost immediately to the room they had left.

It was empty. The little form was lying still and motionless on the white bed; but Marianna had left the room to go to her mistress.

CHAPTER XXVI.

SIR ALAN knelt down by the bed and contemplated the marble features, shaded by the clustering fair curls, until his eyes grew misty with unshed tears. Why had this terrible trial fallen upon him? Why had this child, in whom he had so greatly delighted, been taken from him? What had he done to merit, to require such severe chastisement?

Swift as thought the answer came to him. Had his harshness to his wife not fully deserved some punishment? Might she not have been less guilty than he imagined? Did not his pride, his jealous intolerance, his refusal to hear any explanation, merit some little correction? Was it for this end that the boy was taken? Many a softening thought came into Alan Vincent's heart as he knelt by his dead child, and thought of the child's mother, his wife, to whom he had meted such a harsh measure, whom he had judged with such a harsh judgment.

He thought of Cora again as he had met her first in her sweet girlhood, with her bright beauty untouched with care; Cora lying motionless in his arms, as he carried her out of the room where her dead brother lay; Cora, with her sweet, grateful face raised to his as they stood together by Harold Sinclair's grave; Cora, trembling and tearful, accepting the love he offered her at last. And then, as his wife, beautiful, and to all appearance happy, holding her child in her arms, gay, laughing, triumphant; queening it in society, *feted* and courted by all; in Paris restless and uneasy; at Amiens cowering at his feet in her humiliation and abasement; and now white, haggard, despairing, with her baby lying dead upon her breast.

"Oh! Cora—Cora!" broke from his lips, as he bowed his head in his hands, and his frame shook with the tearless sobs of a strong man's agony.

At last he had given way, the strong wall of coldness and reserve he had erected between himself and Cora had broken down. If there could not be perfect love and confidence between them, could there not be peace? Could not this dreadful reign of outward defiance on her side and indifference on his be over? At least they could be friends. He would go to Cora, now that she was softened by trouble, and ask her to forgive his harshness, his cruel judgment of her, and he could help her to bear their joint affliction.

He rose slowly from his knees and stooped over the lifeless form, pressing a long tender kiss on the little lips where Cora's had rested but a short time before, and quietly opening the door, went out and closed it after him.

As he went down stairs a housemaid, with swollen eyes and tear-stained face, was sorrowfully performing her morning work. She looked at Sir Alan mournfully and pitifully as he passed her, looking worn and haggard, still wearing his evening dress, and the ready, easy tears came to her eyes again.

He went down into the dining-room, hesitating whether to seek his wife now or wait a little until Dr. Grayling came, and, in this state of indecision threw himself into a deep leathern arm-chair, and bent his face upon his hand.

A light tap at the door aroused him, and at the mechanical "Come in," which he uttered, the servant he had passed on the stairs entered, holding a letter in her hand.

"I beg your pardon, sir," she said, huskily, "but I found this on the stairs. It is directed to my lady, I think, but she will not let anyone in. Will you keep it, sir, please?"

Sir Alan stretched out his hand and took the letter. The next moment he had dropped it upon the table as if it had stung him; and the pallor of his face grew yet more intense.

"Oh! sir, you are ill. Let me get you something," said the maid, startled and alarmed.

"There is no necessity," said Sir Alan, with an effort repressing all emotion. "Thank you, Peters; I will give Lady Vincent her letter."

The girl curtseyed and disappeared, leaving Sir Alan gazing at the letter which lay upon the table with fierce, agonized eyes, and a face from which all softness had departed.

"Even now," he said, bitterly, to himself—"even now—ah, Heaven! when I was trying to forget the past—when I had begun to hope——"

He rose from his seat, and walked up and down the room with hasty but uncertain steps, pausing now and then to look with fascinated eyes on the fatal missive, as it lay on the table before him.

"Shall I open it?" he soliloquised. "I have a right; and yet——no, I will not open it. It is hers, and she loves him."

Again the restless pacing to and fro; again the mental struggle whether he should open the letter Lord Almane had addressed to his wife Again he decided that he would not.

"How did it reach her?" he said to himself, as he contemplated it. "It has not been through the post. Are any of the servants in his pay? Has she seen him again? Does she meet him? Is she false as himself?—false, while I—Heaven help me!—I love her still."

And hiding his face in his hands, Alan Vincent, the eminent sculptor, the successful man *par excellence* of the day, broke into tears at the shattering of his hopes, and cried like a child over the wreck of his happiness. Ah! me—

"They who have loved the fondest, the purest,
Too often have wept o'er the dream they believed."

CHAPTER XXVII.

"LADY LUCIE BELMONT, my lady," announced Spills at the door of Lady Cora's boudoir, and her mistress rose up with a languid movement, strangely unlike her usual vivacity, to meet her visitor, who came forward with outstretched hands and her eyes full of tears.

"Cora, I could not help coming, I am so sorry for you, dear."

Cora answered mechanically, and Lady Lucie sat down beside her, her tears falling fast upon her companion's heavy mourning dress, while Cora's own eyes were dry and tearless, and glittering with an incipient light of fever.

"They told me you received no one," went on Lady Lucie, tenderly clasping her hand in both hers; "but I hoped you would see me. How can I comfort you? How can I help you to bear it better, dear? For the sake of old times I should like to do something for you."

"No one can do anything," said the dreary voice, in slow tuneless accents. "He was all I had in the world to love, and he is taken."

"Do not speak so mournfully, Cora. Remember your husband—you must be brave for his sake."

A faint, bitter smile rose on Cora's lips, so inexpressibly sad and hopeless, that for a moment her visitor could not speak.

"It is very—very sad for you, dear Cora," she said in a moment; "but you must not be so hopeless and despairing. Think how happy your little one is now."

"He was very happy here," said the bereaved young mother. "Why was he taken from me, Lady Lucie?" she added, passionately. "Other mothers have husbands who love them, besides their children, and when the little ones are taken they have still some hope in life. I have—none—none—none!"

Her voice rose in anguish; but before Lucie could interpose she went on again:

"I cannot be resigned, I cannot be happy. He was the one person on earth who cared whether I lived or died. Now he is gone, I am alone. My husband—he cares not for me. Better for him—much better that I were dead and he were free!"

She turned from her visitor, and throwing up her arms above her head, flung herself on the cushions in passionate despair.

Lady Lucie waited, soothing her with gentle words and caresses until she grew calmer, then she rose to go, weeping, although the childless mother did not shed a tear, and submitted to her caresses with a passive endurance.

As Lady Lucie went across the landing Sir Alan came out of his studio, and advanced towards her. She had not seen him since the death of his son, about a month before, and started at the change she perceived in him.

"Have you seen Cora?" he said, eagerly. "How is she bearing it? Lady Lucie, she will not see me, and yet, poor child——"

He broke off abruptly with a heavy sigh, and Lady Lucie told him of her deep sympathy with his trouble.

"Sir Alan," she went on, timidly, clasping her little hands as she lifted her blue eyes to his face, "you will not think me presumptuous, or that I am taking an unpardonable liberty. I, too, have known suffering."

He led her gently into the studio, and made her sit down on a pile of cushions, arranged in Eastern fashion upon the floor.

"What is it, Lady Lucie?" he said, gently. "You could not take a liberty with me. Tell me frankly what you wish to say."

"You will not be angry?" she queried, doubtfully, then she went on quickly: "Sir Alan, I cannot help seeing that something is wrong between you and Cora. Could I do anything? I fear very much that it may be caused by the same person through whom I myself suffered. I believe now that it was partly through want of perfect frankness—— Please let me speak," she continued, eagerly, as he was about to interrupt. "I know somewhat of the cause of your trouble. George Leeson"—the fair face flushed slightly here—"told me a little. Are you sure you are not misjudging your wife? She suffers so much from your coldness."

Sir Alan sighed heavily.

"Lady Lucy," he said, gently, "I know how sincere your friendship is, and how kind your intention; but it is not from my coldness that Cora suffers. I think she is unhappy: but a marriage contracted, not only without love, but when the love was given, cannot be a happy one. Her affection, poor girl, was given long before I met her; it is too late now to alter. We must both bear our cross, you know. Believe me, I feel, and deeply, that you wish to see us happier. Perhaps in later years, when we forget—until then——"

Lady Lucie rose sorrowfully; she saw from Sir Alan's resolute tone that there was no present hope, and she took her leave sadly.

When she entered the carriage, the powdered footman glanced surprisedly at the remains of tears upon her face; but the surprise deepened when she gave him the address; instead of the "Home" he had expected, she said, quietly:

"Drive to Mr. Leeson's studio in Elm Tree Walk."

While Lady Lucie Belmont was driving rapidly towards the old street overlooking the river where Mr. Leeson lived, Alan Vincent had returned to his studio, thinking of what she had said; and calmly as he had received her words, they had not been without effect. Perhaps after all, he told himself, he had not been quite fair to Cora; but then, the proofs were overwhelming. Had he not met her with Lord Almane and accidentally intercepted their flight?

True, the Viscount had, on that gray October morning, when they had met, in the early dawn, on the sands at Audresselles, proclaimed Cora's innocence; but he laughed at an assurance belied by proofs. Had not Marks, after he left his service, written him a letter, telling him that he had, many a time and oft, been the unseen spectator of passionate love-scenes between Lady Cora Vincent and Lord Almane? and the man could have had no motive for such an assertion.

Besides, had not he himself found in the railway carriage—had he not still in his possession—the little note in Cora's handwriting, agreeing to the flight with Lord Almane—the flight he had intercepted? Of what avail would explanations have been? What could she have said, with truth, to justify herself? Nothing! Nay, did he not hold still—unread, it is true—the letter addressed to her by Lord Almane, which had been brought to him on the morning their boy had been taken? Ah! she was guilty—she was unworthy.

No; if Cora suffered, she brought the suffering on herself, and the burden she had laid upon herself she must bear; but when he thought of her sitting alone in her terrible grief and bereavement, he felt, by the intense yearning to comfort her and lessen her grief, that his love for her was as strong as ever. He remembered her agony on the night when summoned by Marianna, she found her little son attacked with croup; again he heard her wild, imploring cry to the sympathizing physician.

"Oh! save him—save him for me! He is all I have in the world!"

And his heart softened strangely towards the woman whom he loved—loved still, believing her to be unworthy.

The studio seemed awfully still and quiet that evening as dusk gathered around. Sir Alan felt the loneliness dreadfully oppressive; and, leaving the room, he ordered his horse, and rode away to The Bungalow, resolved to tell his mother all, and entreat her advice, and clear, impartial judgment.

Cora, in her silent room heard him go, and went to the window to see him ride away, standing there motionless until he was out of sight.

A few moments after, her maid came in with a message to say that Sir Alan had ridden over to Lady Vincent's, and would not return until the morning.

"Very well," Cora replied, in the dreary tuneless voice habitual to her now. "I shall not require you again this evening, Spills."

"Very well, my lady. Can I bring you anything?"

"No, thank you; I shall want nothing more."

And Cora glanced up, and gave the woman a very faint, sad smile. Then she put out her hand.

"You have always been kind and attentive to me," she said, gently. "I am not unmindful of it."

"No, dear my lady, I would do anything. I wish I could do something," faltered the maid, as she went away, wiping off her tears, which had not ceased to flow when she reached the servants' hall, where they were noticed, and commented upon.

"My lady looked, and spoke so gentle," said Spills, sobbing. "She seemed as if she was bidding me good-by!"

When the maid had disappeared, Cora rose, locked her door, and began pacing up and down the room with bent head and clasped hands. A crowd of memories, bitter and sweet came surging up in her mind. Even her childhood's days—the merry, happy life before her father's death—came back to her; her early girlhood, her happy home at The Tryst, her brother, Lord Almane, that dreadful time at Rome, when Harold had been taken from her, and when her husband had proved himself so tender and faithful. These were followed by later memories: the long, happy, dream-like time which had followed her marriage, the birth of her child, and Sir Alan's joy, their pride and delight in him. Then came the dark shadow which had fallen upon them in Paris, the subsequent misery, and, finally, the visit of that

"Reaper, whose name is Death,
Who, with his sickle keen,
Reaps the bearded grain at a breath,
And the flowers that grow between."

And here Cora's head sank lower, and her frame quivered with anguish.

When she raised her head, her pale face had an expression of resolution stamped upon it.

She crossed over to her davenport, unlocked it, and looked out some letters—a few of Sir Alan's, written at various times of their engagement and some of her brother's, which she fastened together, and hid in her breast. Then she went slowly into the rooms which had been little Harold's, and lingered there awhile, touching with tender fingers the little garments which had been folded away, taking up with reverent hands the toys he had used, and replacing them in their places without a tear or sigh. Then she came round to the little cot, and sank on her knees beside it, resting her head on the snowy pillow, where the child's had so often laid, and caressing it as if it were something living, and able to understand her woe. She knelt there some time; so long that, when she rose, her limbs were cramped and stiff, and, for a moment, she had to steady herself against the bed. When she returned to the room she had left, the fire was dying out, and the household had retired to rest, for all seemed quiet.

Throwing herself upon a couch, she waited, watching the dying embers on the hearth, listening intently to hear if all was still, with a strange, stony glare in her large eyes, and a set look upon her fair face.

Now and then a few words escaped her pale lips.

"It cannot be sin when one is so miserable; at least, one will suffer no longer. He will not care—perhaps no one will ever know."

Then, when all was still in the house, when hardly a sound disturbed the echoes of the silent square, she rose and made her way out of the room, across the gallery and the studio into a room beyond—a little room overlooking the square, half library, half study, which Sir Alan had named his "den," and where he kept his chemicals of various kinds and drugs.

Putting her light upon the table, with a firm step Lady Cora approached a tall, ebony cabinet at one end of the room, but when she attempted to open it, she found that it was locked. Hastily she looked over the room, hoping to find the key, but her search was vain. Then she remembered that Sir Alan kept his keys in his dressing-room, and she went there with the same firm tread and fixed expression on her pallid countenance.

Having found them she returned, and having tried several, fitted one into the lock and opened it; sundry small bottles stood upon the dark shelves, and Cora took up first one and then the other irresolutely.

At last she found the one she sought, a small glass phial, labelled "Laudanum—Poison." Hurriedly relocking the cabinet, she turned from it, and taking out the stopper from the bottle, she raised it to her lips.

One moment more and Cora Vincent's short life would have been ended; but even as she raised her hand, her arm was caught from behind, the phial snatched from her hand and thrown violently upon the ground, breaking into pieces as it fell, and a faint heavy odor arose from the liquid it had contained.

Cora uttered a faint cry of terror, and sank upon her knees by the table, hiding her face in both her hands.

CHAPTER XXVIII.

"We fell out my wife and I,
And kissed again with tears."

For some minutes Cora did not venture to raise her head, even to ascertain who it was who, by sudden intervention, had thus defeated her purpose; but when she uncovered her face she saw that it was her husband who had seized the phial and destroyed it, and the same glance showed her that he was terribly agitated. He stood leaning against the wall with his head bowed upon his breast, and the strong, white hands shaking like an aspen from the sudden terror. Of the two Cora was the more self-possessed, her hand was steady enough as she rose from her kneeling position and faced him almost defiantly; but she did not speak, and it was some minutes before Sir Alan could master his emotion sufficiently to do so.

"Cora," he said, in a low, horror-stricken voice, "what were you about to do?"

"Simply this," she said, calmly, "to rid myself of a burden which is getting unbearable to me, and to rid you of my presence. Why did you come so inopportunely? Had you been half an hour later all would have been over satisfactorily to us both!"

"How can you—how dare you speak thus, Cora?" he said. "I thank Heaven that I arrived in time. Oh, think what you were going to do, and——"

"Do you suppose I have not thought?" she said, bitterly. "It is because I have done so—because I feel that my misery will end in driving me mad—that I wish to end my wretched, my most miserable life. While my boy lived I was not quite hopeless, now——"

She turned away with a hopeless, despairing gesture.—[To be continued.

LEAVES FROM THE BIRCHES.

EVA.

CHIRRUP, chirrup, r-r chee, and looking out into the fragrant shadow of an old, gnarled apple tree, I see a great, red-breasted robin, sitting in the warm June sunshine. What a rollicking fellow he is, to be sure! see how he swings on tiny twig with never a wink of the bright red eyes: now he hops higher where the shade is thicker and the sunlight checks his crimson breast, and the lovely blossoms puff their sweet breath at him; round and round he hops, tipping back and forth, pouring out his rich, liquid notes in mad, boisterous glee. Now he darts off, and only the gentle swaying of that branch convinces us we have not been half asleep and dreaming, wooed by the sweet scents and sounds of this pleasant afternoon.

I see many things from this window of mine. There are sprays of melting pink in the shape of hearts, with a speck in the center, peeping everywhere, long, old sprays, faded and gray, and baby sprays just learning how to hang daintily and sway gracefully in the fickle breeze. The language of this flower is woe, and is that why they are in the shape of hearts, and do human hearts blossom into as rare beauty when all cause for sorrow is left behind? Close by it is a slender plum tree, not quite so romantic perhaps, but more satisfying to the physical needs, as is the wine plant, spreading its tent over by the grape trellis. Chirrup chee chee chee, you conceited fellow, did you think I could not get along without your company? There is a hive of bees near that apple tree, and one benevolent branch reaches down its wealth of blossoms for their benefit, and they tumble on and over it without a word of thanks, and fly home heavily laden. Here a bed of pansies turn their faces toward me, all smiling, but with different shades of expression. Some blue and melancholy, some nearly black and very energetic looking, and some with golden hearts like a few people I love. There is a bunch of grass pinks, which whisper to me of sister bunches dwelling over a tiny grave miles and miles away. A "General Washington" droops and pines for its old quarters in the sitting-room window, for though its (his) predecessor delighted in situations that favored progression, this one finds itself indignant at the sun's hot rays, and bows its head in dejection.

A broken flower-rack lies in the path. What can I say of that? Oh! yes, the little fingers that fashioned it—fingers that belonged to a rude, noisy boy; but—what should we do without them? Then a rug made by some dear old work-worn hands, "such beautiful, beautiful hands," that lies on the springing grass, and the grass that looks like tufts and waves of emerald velvet—chirr chirr-rr-r chee. And upon the hill yonder is a house, a white house I should say, half hidden by trees. Who can tell of the hopes and disappointments, joys and sorrows, that have blossomed and died beneath that old roof tree? I can see in imagination the prattling child, the coy maiden, and the shy, sweet bride that stepped into matronhood there, with the crystal cup of hope pressed to her loving lips; the aged father and mother who sit alone and wait for the summons to a brighter, pleasanter home.

Up against an old building is a bunch of "burdock." Its broad leaves carry me back to childhood, when a loved companion would use the "burs" for purposes of adornment. He would string them up the creased pant leg, run them in single file over his shoulders and coat sleeves, and my imagination would clothe him in soldier uniform, and these were the "stripes of honor," and no conquering hero ever felt prouder than I did of that boyish, handsome face and figure. The only things left within my range of vision are (must I mention those prosaic things) the door-step, a pile of brush, and a clothes-line. But the shadow of the house roof has some way got into the middle of the flower bed, which reminds me it is tea time.

CONJUGAL DISCORDS.

M. H.

THE weaknesses and follies of women are a theme on which men, from the sage to the clown, have at all times been eloquent. Her natural coquetry in dress, her maternal vanity, her devotion to the little elegancies of the home, to clean windows and fresh curtains, are inexhaustible sources of masculine merriment or abuse. What housekeeper ever complained of an aching back or of nervous irritation without being scolded by her "lord" for some extra work she had done in beautifying the home? Men never seem to learn that women, as a rule, cannot find life endurable in the atmosphere of dust and disorder which characterizes bachelor housekeeping, and which seldom disturbs the equanimity of the masculine mind in the least. Men and women are so different in their tastes and ways that there must always be discord and unhappiness in the household until the sexes give over trying to change or remodel those tastes and ways, and learn to respect them. Men must accept as inevitable the fact that women to be happy must have artistic, or at least dainty and cozy, environments; and women must learn to preserve their souls in quiet when men spill their tobacco and ashes over the carpets and tables, for probably no man ever lived who could fill a pipe, even from a wash-tub, without scattering the tobacco over the premises.

That the sexes will give over trying to reform each other does not seem likely to happen very soon. Indeed, one might be pardoned for believing that matrimony is specially adapted to develop all the imperfections and meannesses of human character, and that even of those matches that are made in heaven, the devil arranges all the subsequent conditions. There is hardly a pure and innocent delight that unmarried women enjoy which they can carry into that blissful world bounded by the marriage-ring. One of those delights is that of squandering a little money, which is merely the equivalent of man spending it as he likes, without accounting to any one. Few wives can do this and not be subjected to the humiliation of hearing the husband say, "My dear, are you not a little extravagant? Is all that money gone that I gave you last week?"

Men and women seem incapacitated, in the very nature of things, from understanding each other. While mutually enamored they meet as upon a bridge—a Bridge of Sighs perhaps: break this, and they are for ever separated as by an impassable gulf. Leaving aside entirely the enamored state, do men as a rule seek the society of women and prefer it to that of men? The thriving clubs, the billiard and drinking saloons, and the other resorts of men common all over the civilized world, seem very like a negative answer to the question. In savage life we know that the sexes do not hunt or fish or do any work together. In our modern drawing-rooms most men confess themselves "bored." They long to get away to their clubs or some other resort of their fellows. When husbands spend their evenings at home, if no one happens to call, it is not common for them to enter into long and exhilerating conversations with their wives. To be sure, wives are too often ignorant of the subjects that interest intelligent men; still, not more ignorant than before marriage, when the one bridge upon which they could meet was unbroken. *Then* conversation never flagged; it was ever new and entrancing. Both talked pure nonsense, while having the art of "kissing full sense into empty words." On the other hand, it is, I think, quite a defensible proposition, despite the inferences to the contrary drawn from the failure of the Women's Hotel, that women enjoy conversation with women more than with men when there is no possible question of gallantry or flirtation; and, finally, that the recognition of the fact that men and women are not by nature in sympathetic accord, but only attracted through the law of compensation or opposites, will do more than all other things combined to make them study each other's nature and to respect sexual biases and characteristics, the motive for that study being, of course, the consummation of the ideal marriage, where man and woman set themselves together "like perfect music unto noble words."—*Lippincott's for July.*

THE GOOD MAN'S DEPARTURE.

Why weep ye, then, for him, who, having won
The bound of man's appointed years, at last,
Life's blessings all enjoyed, life's labors done,
Serenely to his final rest has passed;
While the soft memory of his virtues yet
Lingers like twilight hues when the bright sun is set.
(*B. yant.*

BRIC-A-BRAC.

A PICTURE IN SIX MINUTES.

A PRIVATE letter received from an American gentleman in Paris gives an amusing account of a picture painted in six minutes. Says the letter:

"We were at the Cafe Chantant the other night. It is a building somewhat larger than the Corcoran Gallery of Art. It is a great place for music, songs and dances. There was one very amusing feature. During one of the *entre'actes* they brought on an artist who was billed to paint a marine view in six minutes all finished for hanging (the picture, not the artist).

"The canvas was brought on.

"Out came the artist, a quiet, nervous-looking young man of about thirty years of age.

"His colors were all upon the pallette, and his brushes were all in his hands.

"'Attention!' sang out the director.

"The artist seized a large brush.

"At a signal the orchestral band struck up a clashing, maddening, nervous waltz.

"As the first note was struck the artist dashed a mass of yellow upon the upper part of the canvas. Then a bit of blue, then white, a dash of purple shadow, and then, with a quick twirl of a clean brush, a dark blue sea is dashed in against the horizon.

"Two minutes gone.

"The waltz goes on faster and faster. The brush keeps time. A huge rock is sketched in with burnt sienna and black. A lighthouse with a vermillion raoge light is dropped upon the top of the rock.

"Clash, crash, one, two, three, a boat under full sail is thrown into the dim distance. Clash, crash, one, two, three, and another boat is dashed in. Light upon the water is thrown in with a free, steady hand. A huge brush then carefully blends the edges of the masses, and, with a profound bow, the artist turns to a cheering audience, gratified, that he is through on time.

"And the wonder is that the picture is startlingly good in its broad effect. It is strong and clear. The colors are good, and not muddily mixed. It was as good a novelty as I ever saw at any show, and it beats all how it amuses the French people."

ANTONY'S ORATION OVER CÆSAR.

[The Text from which Shakspeare wrote his Version.]

FRIENDS, Romans, countrymen! Lend me your ears;
I will return them next Saturday. I come
To bury Cæsar, because the times are hard
And his folks can't afford to hire an undertaker.
The evil that men do lives after them,
In the shape of progeny that reap the
Benefit of their life insurance.
So let it be so with the deceased.
Brutus hath told you Cæsar was ambitious;
What does Brutus know about it?
It is none of his funeral. Would that it were!
Here, under leave of you, I come to
Make a speech at Cæsar's funeral.
He was my friend, faithful and just to me:
He loaned me five dollars once when I was in a pinch,
And signed my petition for a post-office.
But Brutus should wipe off his chin.
Cæsar hath brought many captives home to Rome
Who broke rocks on the streets until their ransoms
Did the general coffers fill.
When that the poor hath cried, Cæsar hath wept,
Because it did'nt cost anything, and
Made him solid with the masses. [Cheers.]
Ambition should be made of sterner stuff,
Yet Brutus says he was ambitious.
Butue is a liar and I can prove it.
You all did see that on the Lupercal
I thrice presented him a Kingly crown
Which thrice he did refuse, because it did not fit him quite.
Was this ambitious! Yet Brutus says he was ambitious,
Brutus is not only the biggest liar in the country,
But a horse thief of the deepest dye. [Applause.]
If you have tears, prepare to shed them now. [Laughter.]
You all do know this ulster.
I remember the first time ever Cæsar put it on,
It was on a summer's evening in his tent,
With the thermometer registering ninety degrees in the shade.
But it was an ulster to be proud of,
And cost him seven dollars at Marcus Swartzmeyer's,
Corner of Fulton and Ferry streets, sign of the red flag.
Old Swartz wanted forty dollars for it,
But finally came down to seven dollars because it was Cæsar!
Was this ambitious? If Brutus says it was
He is a even a greater liar than Mrs Tilton!
Look! in this place ran Cassius' dagger through!
Through this the sun of a gun of Brutus stabbed.
And, when he plucked his cursed steel away,
Mark Antony how the blood of Cæsar followed it!
[Cheers and cries of "Give us something on the Silver bill!" "Hit him again!" etc.]
I come not, friends, to steal away your hearts,
I am no thief, as Brutus is,
Brutus is a monopoly in all that business,
And if he had his deserts, he would be
In the Penitentiary, and don't you forget it!
Kind friends, sweet friends, I do not wish to stir you up
To such a sudden flood of mutiny,
And as it looks like rain
The pall-bearere will proceed to place the coffin in the hearse,
And we will proceed to bury Cæsar,
Not to praise him. *[Oil City Derrick.*

THE portrait of Mrs. Siddons is said to be the only one on which Sir Joshua inscribed his name, as if content to risk his claims to the admiration of future ages on this single example of his matchless skill. It was written on the part of the drapery, and on looking at the picture in its finished state, Mrs. Siddons stooped down to examine what she supposed to be a piece of classic embroidery, but which she found to be Sir Joshua's signature. She turned to the artist, on remarking the circumstance, and Reynolds immediately observed: "I could not lose the honor which this opportunity offered me of transmitting my name to posterity on the hem of your garment."

For Women.

CONDUCTED BY MISS FAITH RIPLEY.

THE LETTER.

BREAK into beautiful blossoms,
O buds of the sunny May,
And sing my robin and bluebird,
Your sweetest carol to-day—
For my love has written a letter,
And the world is all in tune—
He is coming along with the roses
In the fairest days of June.

I am counting the days between us—
I am counting the moments and hours,
Telling my beads, like a solemn nun,
On a rosary of flowers;
For he said, when the buds of the roses
Are flushing in royal red,
He is coming to claim a promise,
(I wonder what I have said?)

Break into songs and blossoms,
O birds and buds of spring:
Lillies, scatter your fragrance,
And sweeter, song-birds, sing;
And skies, drop golden sunshine
On the beautiful days of June,
For my love is coming to see me,
And the world is all in tune.

[Rosemary Leaves.

THE HOUSEKEEPER'S PRUNING SHEARS.

J. E. M'CONAUGHLEY

"SARAH JANE" said Aunt MARGARET solemnly "I am surprised to see you iron a sheet in that manner, after your bringing up!"

"It is as fresh and as sweet as a rose, auntie" said SARAH, folding it up with an air of satisfaction. "If I did iron it only on one side, is not that white enough to suit you."

"I do not find any fault with your washing, but I think your ironing might be improved. I was taught to iron a sheet as nicely as I would a hem-stitched handkerchief."

"You did your duty by me, Aunt MARGARET, I will always bear witness to that. But I think I have improved on your system. I have learneda judicious system of slighting things that may very well be slighted"

"What a word for a housekeeper! Why it is the rankest heresy I ever heard in that line of business. To slight anything was never so much as named by capable women in my day."

"It is a good system for all that," said SARAH placidly. Perhaps it was well for her that she was not Aunt MARGARET'S little girl any more. She smiled as she dimly recalled sundry boxed ears in olden times, as the reward for "slighting" according to the standard of that thoroughgoing women.

"I think it a very great art to learn what may be slighted to advantage. It gives you more time and strength to lay out on things that you wish to do the very best you can. For instance, I make everything as clean as the best soap, water, machine and sunshine can do it. Then I iron as well as I can all the starched clothes and the table linen, and pass over more lightly and swiftly all the coarser things. Plenty of pieces I only iron on one side. The stockings I do not iron, but smooth them out and roll them together in pairs. It is a poor foot that cannot iron its own stocking. Now, really, Aunt MARGARET, is not this better than wasting precious hours in such works of supererogation as ironing tea towels as carefully as the baby's bibs. When there are so many good books and papers in the world to read, so many kind friends to run in and visit for a half hour, and so many sick neighbors, at times, who need a bowl of delicious broth, or a saucer of jelly. How could I waste my time so, when all these duties are so pressing nearly every day.

I flatter myself that I am a very thorough housekeeper in my way, and I hold myself in readiness for improvement all the time. But I desire never to advance backwards. You may inspect my house from garret to cellar and I shall not blush; but you may not agree with me on all my points. Still I can give you a good reason for them, Auntie. I have good health and strength, and it is not half so hard now I have learned judiciously to lop off work when it can very properly be done. Indeed I think if every weak and weary woman would go through her affairs (metaphorically) with a pair of pruning shears, and snip off the useless things here and there that so waste her life powers, she would wake up to find herself a new woman in a few weeks. Look at one little item, ruffles or no ruffles for baby: what a difference that makes with the ironing table in the course of a twelvemonth! I make pretty, flat trimmings of cambric, stitched at the edges, and her little aprons take no longer to iron than a pocket handkerchief. I consider my laundry work in all my gettings and makings, and that is one place where I save by my pruning shears." Of course Auntie only saw in this talk another illustration of the degeneracy of the times, but just now the baby woke up and that

"Quite ended the conversation."

TALK ABOUT MY JEWELS.—No. 3.

BY MARGUERITE.

A VERY proud and thankful mother was I when I was able to hold a little daughter of my own in my arms. How tenderly my heart went out to the little spark of life; what good, noble and pure things I desired for her.

Cousin LILY came in one day to see her and rejoice with us over our jewel; and, while looking down upon her fondly, she exclaimed: "Isn't it a pity she had to be born a sinner?" I think it was the first time that I had ever thought that my child would sin. Of course I was aware that *other people's* did. Since then, my heart has re-echoed her words a thousand times, for the months were few before we discovered that baby was self-willed. I well remember one evening, she commenced a battle with the "Sandman," and would not yield to his mystic influence. I became tired of holding her, so I fixed her little bed as comfortably and invitingly as I could, and told her she must lie still and go to sleep. She would not. I punished her. She cried and yelled and kicked, and writhed as if in great agony and pain. I was puzzled and called Papa from the store. The moment he came in, he said: "Why, my little girl is very sick! We must have some warm water immediately." Very soon the little feet were placed in the bath-tub where she executed an impromptu dance for a few seconds and then was quiet. Papa gave her a dose of peppermint, and wrapped her in a blanket. After this, she was kissed and petted until she was asleep: For days after Papa would remark "How very sick my little girl was the other night!"

I do not remember her having a similar attack for some time. It occurred when I was visiting at father's. It was her bed time, but she did not believe it. I carried her to my room by main force, and put on her night dress. Again she rolled and writhed as if the little body was suffering extreme pain. Auntie declared "she must be sick," and Mamma surely thought she acted like it, so a dose of paregoric was hastily given her, which quieted her in an instant.

The next morning I asked my mother if she thought Gertie was sick the night before, or was it only an exhibition of naughtiness. A smile played around the corners of her mouth as she answered, "I think it was the latter." How my heart cried out for wisdom then as it has often since.

If our lives are pure, if our faith is strong, and if we hold up the Cross to our children, and by prayer and teaching, show them the infinite loveliness of our Saviour's character, we may find some tribulation in this world, but there will be more of joy; and we will at last awake where the light from the Sun of Righteousness will rest upon us eternally.

A SERMON TO GIRLS ON COOKING.

COOKING-CLASSES have been popular among fashionable young ladies of late years; but there is no cooking-class which quite equals in its opportunity for excellent information that which you may find at home. Presuming that I am talking to a girl who has just left school, I advise you to make use of your leisure in taking lessons from your mother. There is an absolutely splendid feeling of independence in knowing how to make perfectly light, sweet, substantial bread. Then try your hand at biscuits, muffins, corn bread, toast, and all the different forms into which bread-stuffs may be blended. Toast seems a simple thing enough, but is frequently so ill made that it does not deserve the name. Gruel, a necessity of the sick-room, is often a hopeless mystery to women who have no idea of how it is evolved from the raw material. After you have mastered the bread question, try meats and vegetables.

Any bright girl who can comprehend an equation, or formulate a syllogism, can overcome the difficulties which beset her when learning to cook. Lucent syrups, golden cakes, delicately-browned bread, quivering jellies, melting creams, and the whole set of material things glorified, because made for love's sake, and for the good of one's dear ones, are fit expressions for any woman. The charm of this accomplishment lies in the fact that it imparts to its owner a gratifying sense of power; it bestows on her, too, the power of blessing and resting those she loves best. Wherever the cook goes she takes her welcome along. One may tire of the sweetest singing, of the loveliest poetry, of the finest painting, and of the most witty conversation, but of cooking never. Yet I would be sorry to have you contented to be only a cook, only a domestic machine. That is not my meaning or intention. Be artist, poet, inventor, and well-bred woman; be the most and the best that you can and add, as a matter of couse, ability to keep house well and to do all that good housekeeping includes.—*S. S. Times.*

WOMEN'S INFLUENCE.

B. C. D.

A WRITER in the Women's column of May 18th, refers to the highest officer in our land, as having always been "guided and controlled" by his wife, as if that were a merit in them both. On general principles is this so? Our impressions of GEORGE WASHINGTON are, that he was a man of patriotism and integrity, that although his wife was a wise counsellor and companion, yet the qualities which make his name now revered were his own, and not merely the result of his wife's influence.

Besides is not a person who is so very susceptible to good influences as liable to come under the power of evil associations? How can men of fixed principles be so unstable. Men who can stand alone and do battle firmly for the right are the men that I believe in. As to the other women referred to in the same article, who have labored a life-time to bring their inferior husbands into power, they might have employed their time to better advantage. World'y honor won in that way is truly "empty." If mothers would so train their children as to develop an intelligent conscience and a firm determination to adhere to the right at all hazards, when they became men they could play a manly part in the world without depending on the influence of their wives to uphold them. The influence of a good wife to restrain her husband from evil, or to confirm the well-disposed in the right path, is not to be despised. Let us hear more about noble rock-rooted qualities inhereot to the heart of man: where these are wanting, "influence" only makes a man's weakness more conspicuous.

WEDDED LOVE.

A TRUE INCIDENT.

STARR MORRIS.

"MAKE the bed easy, Mr. B." said old Uncle ABE, to the undertaker who was preparing the coffin for his aged wife. "Make the bed soft and easy, for her old bones are tender and soft, and a hard bed will hurt them."

He forgot for a moment—that old, gray-haired man, that she was dead; that the old bones had done aching forever.

Sixty-four years had she walked by his side, a true and loving wife. Sixty-four years! just think of it, in this age of divorce!

Sixty-four years had they dwelt under the same roof-tree; together shared the same joys and the same sorrows of life; together mourned over the coffin of their first-born; together rejoiced in the prosperity of their sons and daughters, and now she had left him alone. No wonder he forgot. Her loving hands had so long cared for him, for he had been the feebler of the two.

"Until death do us part," said the marriage service that had united them, so many years ago. Death had parted them, but the love still survived. Tenderly had he cared for her all these years, and now tenderly did he watch the making of the last bed of this still loved wife.

He had ravely breasted the storm of life with her by his side, but now that she was gone he could not live, and in a few days they laid him by her side.

FERNS AND FLOWERS.

S. H. R.

THE month of June is the best time to gather ferns for winter trimmings or decorations. They are now perfect in form, and far prettier than when large and rank; the color is brighter, and insects have not made flaws in the leaves; another thing, they are smoother and dry quicker.

If those who make a habit of gathering them would only try to secure them early, they would never delay until fall again.

Mosses, too, gathered now, will take a brighter color than if left till the pests come. It is a pleasant recreation to gather them, and they make the walls of a room pleasant and bright during the bleak winter.

Some green leaves, too, ought to be saved as they look pretty mixed in with the gay autumn colors, and make a cheerful contrast in the trimming of rooms.

Flowers for Herbariums are beautiful now, and one can secure a greater variety than if they commence gathering them later in the season. They are not as liable to mold, or become dull, as when pressed when the weather is warmer. Just try it one year, and mark the difference.

"TOO LATE."

MOST of us have learned by bitter experience how much of pain and sorrow those two little words can express, and it is because I would spare some of the RURAL ladies the pain of disappointment that I venture to remind them that the time is drawing near for the close of the "Cricket" offer. Those who want to possess themselves of this popular little clock have no time to lose. It is superfluous for me to draw attention to the excellencies of this time-piece, the favorable opinion with which the publisher has regarded it from the first, has been enthusiastically endorsed by all who have received one, as can be very readily ascertained by reference to the letters published under "What they say of it." All that remains for me to do is to urge my friends of the RURAL to so time their order as to escape being "too late."

ITEMS FOR CORRESPONDENTS.

Miss LILY GORDON, Keokuk, Iowa.—Take your dark purple silk for an underskirt, and for an overdress buy purple embossed grenadine. It comes at six dollars per yard; ten yards will be sufficient. For trimming use pipings or cordings of light blue silk. I send you by mail cut of a suitable polonaise, pattern of it costs 30 cents.

MAMIE BROWN, Alleghany Co., N. Y.—Ladies use small gilt pins to fasten the outside cuffs. They can be purchased at 50 or 60 cents per pair, either plain or enamelled.

Mrs. L. BATES, Platt Co., Ill.—A pair of French gilt earrings—an arrow with a pearl in crown-setting, a pretty and unique design—I can buy for 50 cents. They are chaste-looking, and better for your purpose than a more expensive pair.

Mrs. SARAH LIPPINCOTT, Venango Co., Pa.—Excellent quality of French lace, a finger wide, can be bought for 35 cents per yard. At least ten yards will be required to trim your basque and overskirt.

DEAR FRIENDS:—As there was a wood stain called for, I send the following which I have used many times and know to be good.

CHEAP WOOD STAIN IN IMITATION OF BLACK-WALNUT.—Mix burnt umber, with the best of cider vinegar, to the consistency of thin paint, apply with a paint brush to the wood; when perfectly dry, go over with a coat of common furniture varnish, when that is dry, another is needed to make nice, durable work.

CHOKED CATTLE.—Take of fine-cut tobacco enough to make a ball as large as a hen's egg. Dampen with molasses till it adheres closely. Elevate the animal's head, pull out the tongue, and crowd the ball as far down the throat as possible. In fifteen minutes it will cause vomiting, and the apple or potato will come up. BEEBE.

Domestic Economy.

CONDUCTED BY EMILY MAPLE

HOME DECORATION.

JENNIE JOY.

To make home beautiful is the desire of every true householder. To make the surplus earnings go as far as possible to the accomplishment of this end, is the aim of every cultivated person of humble fortune who has a home to beautify; yet how few there are who know how to make the most of what they really do possess. To be able at all times to put the best side out; to utilize the odds and ends; to make the rag-bag, waste-paper basket, wood-yard, field, and forest yield their treasures for the decoration of home, requires a tact, which unhappily, but few possess. It is an art, in fact, which to acquire, richly repays hours of careful study.

Capital can purchase luxuries, but a thorough knowledge of the harmony of form, proportion and color, is requisite to render even these luxuries pleasing to the eye. A few dollars in the hands of the poor man can buy the long-coveted parlor carpet, but unless he has acquired the art of discrimination, the hard-earned parlor carpet may, after all, prove but an eye-sore to the buyer, from its lack of harmony with the other appointments of the home: and, instead of almost furnishing a room of itself, as many a well chosen carpet has done, it will, by its incongruity of tint, figure or texture, present the disagreeable appearance of a gayly colored patch on a faded, thread-bare garment. It is not always the fault of the laborer and his patient, toiling wife, that their cottage walls are bare, or, what to a finely cultivated taste is far more painful to the eye, covered with coarse, cheap chromos: or that the contents of the rag-bag, representing in the rough, abundant material for many a charming chair-tidy, lambrequin, warmly tinted rug or door-mat, are weighed out to the obliging one-horse country peddler in exchange for a tin dipper, or a glass milk-cup, forsooth, which is to be wedded to the white-ware sugar bowl; or that the accumulation of the waste-paper basket shares a like fate, at a sacrifice of many choice gems of literature, pure pearls of thought and lovely *bijoux* of art, which, carefully culled from the rubbish and neatly arranged in a book, would be the source of untold delights, and contribute towards cultivating a taste for the beautiful.

Their eyes are dazzled by the magnificence of their wealthy neighbor's gaudy trappings; and, unconscious of the handsome adornments within easy reach, they begin to rear for themselves an airy castle in the clouds, dome over dome, and to count the time when they, too, shall be rich. Instead of enlarging, by the simple means always at hand, a taste for the loving harmony of all the notes of beauty, they toil on in their plain, dull rooms, with nothing to elevate thought or incite the play of fancy, until taste is hopelessly perverted; and the poor laborer and his patient work-weary wife, lose, beyond hope of recovery, the capacity for the higher delights of the soul which were theirs by divine right. A prominent feature in the appointments of the home is cheerfulness; and no room, however tastefully and richly furnished can present a truly cheerful aspect, unless it is well lighted. How strange, that light, the symbol of all good, without which nothing could exist, should be so often excluded from our dwellings! That the glorious sunlight, giving strength and beauty, brightness and bloom to our garden parterres; should be treated as an enemy to the well-being of the "olive plants round our tables."

Earth's dumb creatures realize perfectly, the sanative benefit to be derived from the sun's rays; hence we observe the mastiff, worn out in his master's service, slowly issuing from his dark kennel, to stretch himself at full length on the sunniest piece of turf within reach, to bask in this elixir of life.

But even the health-giving sunlight will fail to render our rooms cheerful if it falls on leaden-lined walls, and dull, somber-colored carpets and upholstery, which reflect not back the golden beams. Let the walls be embellished with hangings of a soft creamy tint; the pictures upon them be suggestive of happy, active life; let the carpets glow with warm, rich hues so softly and artistically blended that no harsh lines shall detract from the harmony of the whole; place bronzes and other ornaments where they will be ready to fling back with coquettish art, the first ardent glance of the day god as he ascends through the red gates of morning; through parted window-draperies of lace or sheeny muslin, let the red waves of solar light roll in upon us in floods; that they may warm our rooms and the hearts within them; that home may be the brightest, cheeriest spot in all the wide, wide world.

Xenophon says, "A man's home and fireside are the sweetest of all human possessions." Possessing them in all their beauty of perfect harmony, we are richer than kings. Evelyn writes, "'Tis from the want of symmetry in our buildings, decorum in our houses, that the irregularity of our humors and affections may be shrewdly guessed." To correct this outgrowth of a straggling, deviating tendency of the affections, the only proper way is to begin at once the delightful occupation of "brightening up the place." While we are studying the art of rendering our homes and firesides the beautiful temples over which Love may sweetly preside; we are fostering a thousand delicate heart blossoms whose clinging tendrils will keep the affections fresh and full of aroma, even to a ripe old age. Thus every day is a festival, and that which makes it the more splendid is gladness.

Beneath many a rough exterior there awaits our bidding the Sweet Spirit of Beauty; and ever near us lingers her twin sister, Harmony. Our hands may wield the sculptor's chisel which shall unchain the embodied thought hidden within the rough-quarried block or marble; our eyes may discover the flashing jewel within the unpolished stone; our souls strike the key-note which shall waken to life a thousand sweet and holy symphonies in the divine atmosphere of Home. From many a concealed covert and by-place we may woo the very soul of loveliness to come and dwell with us—an abiding guest. Thus shall all the chords of beauty within our habitations sweetly accord with the grander harmonies of the eternal Home. Thus shall we pass from these our earthly Paradises, not as strangers to such delights as the angels know. Thus shall we enter, with soul's attuned, to the celestial melodies. — Our Father's House — by-and-by.

DOMESTIC RECIPES.

Graham Bread.

Set sponge with wheat flour as for white bread; when light stir with a spoon into a pan of Graham flour adding salt and half a cup of molasses to seven pounds of flour, or a large tablespoonful to a medium-sized loaf. Mix and let rise as for white bread, leaving the dough very soft if kneaded, or if mixed with a spoon, as stiff as can be stirred. A hotter oven, also a little longer time in baking is necessary than for white bread. MRS. RANDALL.

Paterson N. J.

Corn Starch Cake.

One cup of sugar; one-half cup of butter; whites of three eggs; one-half cup of sweet milk; one cup of flour; one-half cup of corn-starch; one teaspoonful of cream-of-tartar and one-half of soda. Dissolve the soda in the milk; mix the cream-of-tartar thoroughly with the flour and add the whites beaten to a froth the last thing, flavor to taste. MRS. S. V. W. CARRIS.

Crumb Pudding.

ODD bits of stale cake can be made into a most appetizing dish in the following way: Over a quart of crumbs turn a pint of scalding milk and let them soak. Then add three eggs, well beaten, and a half-pint of milk; half-teacup of desicated cocoanut. Bake twenty minutes. Flavoring may be added, to suit the taste, and raisins or currants, if desired.

To Prevent Stained Hands.

WHEN there is danger of staining the hands from preparing fruit or vegetables, rub them with fresh lard. ROSE GERANIUM.

Baked Fish.

Many cooks find it a difficult thing to remove a baked fish from the pan to the platter, and, in answer to a question as to "how it is done," we give the following method, hoping it will be of service to those who have never tried it: Dress and stuff the fish in the usual way and bind very smoothly with tape or strips of cotton cloth from one end to the other; put several muffin-rings in the baking-pan, rubbing each with a little lard, and on these place the fish; pour a little water in the pan and bake slowly, basting frequently with butter and water. When nicely browned, and cooked sufficiently, remove from the rings with two broad knives—one under the shoulder, the other under the lower part—to the platter. With a sharp knife cut the tape the length of the fish, carefully pulling each piece out. Should the fish then be not quite brown enough, return to the oven-grate for a short time. Have prepared a cup of sweet cream with butter, salt, pepper and chopped parsley, and bring to the boiling point; add any gravy which may be in the baking pan and pour hot over the fish. The scales may be loosened by immersing the fish for a few minutes in hot water, and the earthy taste, so disagreeable in fresh-water fish, may in a measure be overcome by sprinkling plentifully with salt and letting stand over night; in the morning rinse and wipe dry with a napkin. E. M.

News of the Week.

POLITICAL.

Monday, June 17th, 1878.

THE sub-committee of investigation sent to Florida has returned and made a voluminous report. The three principal witnesses examined were McLin, the State canvasser; Diggers, County Judge of Baker County; and Edmonds, Clerk of Leon County during the canvass. Besides the recently published confession of the first, he told but little that is new. Diggers testified that although he was one of the local canvassers for his county, the clerk and a petty justice of the peace canvassed the votes without his knowledge, and returned a democratic majority of ninety-five; whereupon he created a private Board of his own by appointing a temporary justice of the peace, and, securing the sheriff's co-operation, secretly canvassed the votes, and returned a republican majority of forty, by throwing out the votes of two Tilden precincts. One of these was thrown out on the ground of intimidation, because a man told Diggers that his vote had been refused, and promised an affidavit to that effect; the other, on the ground of illegal voting, because there were half a dozen names of non-residents on the list. This return alone was presented by McLin to the State Canvassing Board, because, according to his testimony, it appeared to be properly attested, and most favorable to the republican party. A large number of "jolly jokers," or fraudulent republican voting papers, seem to have been scattered throughout some parts of the State, and Edmonds swore that Joseph Bowes, then Inspector of the Election, and since rewarded with a clerkship in Washington, told him that he had stuffed the ballot-box of Precinct 13, in Leon County, with seventy-three of these "jolly jokers," and so saved the State for Hayes. Offers were made to prove democratic frauds, also, in different parts of the State, but a majority of the sub-committee, which consisted of two democrats and one republican, declined to investigate this branch of the subject.

With regard to the forged signatures to the duplicate certificate of election from Louisiana, ex-Governor Kellogg's clerk, now holding a Government appointment in Washington, testified that Kellogg, having signed the document, handed it to him to have it attended to; that he left it for signature in a room to which any one had access; that no one was placed in charge of it; that after some time he found the names of the electors affixed to it, sealed it up and sent it on to Washington; but that he could not say who signed the names, except those of Kellogg and of a few others whose signatures he was able to identify. There is little doubt but that most of the signatures of electors on it are forgeries, like that of Judge Levissee. A duplicate of the original incorrect certificate, having the genuine signatures of the Louisiana Electors, was submitted to the Electoral Commission along with the forged production, and the republicans therefore claim the members of the Commission had ample data to come to a proper decision, and, consequently, that there is nothing in the case to invalidate any of the proceedings with regard to the Louisiana election before the Electoral Commission, or in the actual count before the two Houses of Congress. On the other hand, the democrats insist that the original document was invalid, because not drawn up in accordance with the Constitutional requirement, and that the Commission were ignorant of the forgeries affixed to the other.

The chief witness before the committee during the week was ex-congressman Darrall of Louisana. He testified that Anderson told him frequently that the name of "visiting statesman" Stoughton, now Minister to Russia, was also attached to the Sherman letter; whereas, Anderson swore before the committee that it bore Sherman's name alone. He also swore that Anderson told him that his protest with regard to intimidation in East Feliciana was true; and in several other points also he flatly contradicted Anderson, though he owned that he had used the latter's influence to secure for himself the collectorship of New Orleans. The rest of the week's evidence was of comparatively small importance, beyond demonstrating the rank corruption of politicians in the Pelican State.

On Friday the House decided, by two separate votes, that the Presidential title cannot be attacked, on the ground that the action of the last Congress was final in this matter; that no subsequent Congress has any constitutional power to revise that action, and that any attempt to do so would be revolutionary. On the first vote there were 215 yeas and 21 nays; and on the second vote, 234 yeas and only 14 nays. This kills Tilden's chance of being installed in the White House at any rate before next election; and secures undisturbed possession of that comfortable mansion to Hayes during his full term of four years.

Senator Matthews has returned no answer to the subpœna to appear before the House Investigating Committee; it is said he fears Butlers' examination; his course is considered highly injurious to his reputation. The chief objection to Hayes' conduct, in connection with politics in Louisiana and Florida, is his appointment to office of nearly all the worthies incriminated or besmirched by the recent revelations. Wood's tariff bill has been defeated in the House by a vote of 134 to 120, only six Republicans voting for it, while a considerable number of Democrats who favor a high tariff, voted against it. Both Houses have agreed to keep the army up to the number of 25,000 men. About eight millions have been appropriated by both Houses for the improvement of rivers and harbors. This is a considerably larger sum than that which Gen. Grant refused to spend in this way, despite the vote of Congress.

Oregon has elected a republican governor and State ticket; but a democratic congressman and legislature, so that Sargent, its present republican Senator, will be succeeded by a democrat. The committee appointed by the Senate to investigate the charges of bribery against Grover, its other democratic Senator, has reported that there is no evidence sufficient to support such charges. The Senate Committee to investigate the claims of Corbin and Butler, of South Carolina, to a seat, decide against the latter who at present holds the position, and was known during the election excitement as "Butcher Butler." Ex-Gov. Noyes arrived in this city early yesterday morning on his way from Paris to testify before the investigating Committee at Washington. He emphatically denies McLin's charge that he promised him a good position provided the vote of Florida was cast for Hayes, and says he will give some business to the committee in investigating democratic frauds.

MISCELLANEOUS.

A meeting of the Keeley Motor Company has just been held in this city to raise more funds; but the opinion is pretty general that the thing is a fraud, and the stock-holders are loath to throw good money after bad. About 10 o'clock on Monday four men armed with revolvers jumped on a crowded street car in this city, robbed an employe of the Company of about $150, beat him shockingly and the conductor severly, sprang into a wagon of theirs which had been following the car, and escaped; nor has the "finest police in the world" hitherto obtained any trace of of them. New York can beat the rest of country even in desperadoes.

The Western Union Telegraph Company has a new president—Norman Green—instead of the late Orton. At Fort Smith Arkansas died Gen. B. L. E. Bonneville, aged eighty-five—the oldest officer in the U. S. Army, and of the leader of the expedition described in Washington Irving's, "Adventures of Captain Bonneville in the Rocky Mountains and the Far West" A Professor Richtel, has been experimenting at Hartford Conn., with a flying machine which he caused to rise and sink in the air at his pleasure and to advance against the breeze.

On Wednesday the 12th, William Cullen Bryant, the Nestor of American journalism and among the first of American poets, died in this city at the age of 84, having been born on the 3rd of Nov. 1794. He never completely recovered from the semi-conscious lethargy produced by the concussion of the brain due to the fall mentioned here a fortnight ago. June snow storms during the week in Canada and even in Mass. The Indians are once more murdering—this time hitherto chiefly the Bannocks of Oregon. During the week the telegrams make a total of 34 men chiefly herders and mail carrier's slaughtered by them. The settlers are raising and equipping volunteer companies and the military are pushing cautiously into the hostile territory. Grave fears are still entertained of a general Indian war.

Violent tornadoes in portions of Ga., S. C. and Va., much property detroyed; several persons killed. Thos Winans, the Baltimore millionaire died on the 10th. The communists and "striking" laborers of Quebec, to the number of about 3,000 began a riot on the 11th; sacked a number of stores and warehouses and threatened general pillage and incindiarism. The troops were called out, and after submitting to a severe stoning by the mob, fired among them, wounding a large number, killing one of the ring-leaders, and putting the rabble to flight. For several days the disorderly element threatened mischief, but the presence of more troops from Montreal overawed them, many of the ring-leaders have been arrested, and for the present all is peaceable. A vast railroad strike is said to be imminent so soon as Congress adjurns to-morrow; but it is probably only a rumor. The defeated adherents of Lerdo are returning from Mexico into Texas; Gen McKinzie with 500 United States troops has crossed into Mexico in pursuit of Escobedo who unlawfully made this country the base of his late movement against Diaz. Towards the close of the session of Congress an effort has been made by a few senators to have cheese made a part of the rations issued to the army. Nothing has been done in the matter yet, and farmers should see to it that their representatives in the next Congress should know the wishes of their agricultural constituencies in this matter. Such a measure would afford to the soldier a healthy, palatable, nutritious and convenient addition to his fare, while to the farmer it would open another market to his product, besides having a tendency to popularize its use.

FOREIGN.

On Thursday last the first session of the Congress assembled to settle the vexed Eastern Question was held at the Badziwill Palace, Berlin. Germany, Austria, France, Great Britain, Italy, Russia and Turkey are the Powers represented. By mutual agreement the deliberations in each session are to be kept strictly secret, until everything has been arranged, and accordingly news with regard to the points discussed or decided must be largely tinctured with conjecture. It seems pretty certain, however, that Great Britain and Russia have agreed on the main points which have hitherto caused disagreement. Despite the protest of her late ally, Russia is resolved at all hazards to re-annex Bessarabia, which was taken from her and assigned to Roumania at the close of the Crimean war. This understood, she is willing that the entire treaty of San Stefano should be acted upon and modified by the Congress. With regard to the issue of the meeting, it is impossible as yet, to predict anything with certainty; but it is well nigh certain that peace must come of it, whatever may be the changes effected by it in the map of Eastern Europe and Western Asia. The final terms are as yet in a great measure guesswork, and for details of that kind of work there is no room in the small space accordable to news in an agricultural paper.

Massacres still continue in Bulgaria, as the Bulgarians seem determined to avenge ages of oppression by slaughtering all their Mahommedan neighbors. Vast numbers of the latter have flocked to mountain fastnesses where they defy the attacks of their enemies and even of Russian detachments, while they make frequent raids on the lower country and terribly avenge the deaths of their co-religionists. There are about 100,000 of such refugees in the Rhodope Mountains alone.

The Emperor of Germany is nearly well; and Nobeling also is much better. The Reichstag, or

Imperial Legislature has been dissolved, and an election of members takes place on July 30th. Bismarck is resolved to take advantage of the feelings of horror and loyalty aroused throughout the country by the two attempts to assassinate the Emperor, and to secure a more complaisant legislature than the present one. The other day, it refused to agree to the resolution he introduced giving the Government discretionary power for three years over publications, meetings, or societies having socialistic tendencies, and making the police the sole judges of the fact. This would virtually place the entire press—newspaper, periodical and book—wholly at his mercy. It had previously declined to pass other laws he demanded, and he now expects to secure the election of a less independent assembly. He is reported to have said that peace is just now essential to all Europe, in order that each nation should attend to the suppression of anarchical factions at home.

The synod of "Old Catholics," now in session at Bonn, has, by a vote of 75 to 22, adopted a resolution in favor of the marriage of the clergy. The strikers in Lancashire, England, are going to work at the 10 per cent. reduction in wages against which they struck. The war in Cuba is finally over, all the insurgents having, at last, surrendered. The Shah of Persia, after visiting St. Petersburgh, has arrived in Paris. The Empress of Russia has been dangerously sick, but is recovering.

At Paris, on the 12th, died George V. ex-King of Hanover. During the war between Austria and Prussia, in 1866, he sided with the former, which was at the time head of the German Confederation. After the triumph of Prussia at the battle of Sadowa, the expulsion of Austria from the Teutonic Confederac , and the installation of Prussia in her stead, the latter by a mere decree annexed to her dominions the petty kingdom of Hanover, confiscating all the private property that could be reached belonging to the king, because he foolishly objected to the little transaction. Knowing something of Bismarck's dislike of "nonsense" in treating with the shoal of German, kinglings, princelings, and dukelings, the old man in advance had prudently sent most of his "movables" to London, so that he has hitherto managed to get along pretty comfortably. Now that he is out of the way, his heir, it is said, will gladly agree to the absorption by Prussia of his royal inheritance provided the private one is restored. The young are wiser than the old in their greater readiness to yield gracefully to the inevitable. HERMAN.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, June 15, 1878.

BEANS AND PEAS.—The beanmarket is without a new feature; mediums have a show of firmness owing to the moderate supply, but there is not trade enough at this season to encourage the desire to advance them. Still they are high compared with marrows. There is a fair export movement in the latter, but the stock is so large that buyers can obtain a shading from our extreme when they apply for round parcels with any regularity. White kidneys are easy in sympathy with marrows. The few Red do. that remain have been run up too high for steady business. Pea beans are firm for choice, but there is a light offering of that grade. Limas are doing well. Black, steady, with prospect of improved call. Green peas steady at $1.05@1.10; Southern B. E. peas, $1@3.25 per two bush. bag. Canadian in bulk and bond, 78c.

We quote medium beans, prime, $1 60@1 62; fair to good, $1 35@1 50; marrows, prime, free on board ship, $1 57½; fair to good, $1 40@1 50; Peas, $1 40@1 65; white kidney, $1 40@1 60; red do., $2 50@2 90; black, $2 35@2 40; Lima, $4.15@4.25.

Receipts of beans past week, 3,675 bush. Exports of beans, 1,780 bbls. Exports of peas, 12,700 bush.

BUTTER.—Dealers speak of the market as better, but there is more resignation than cheerfulness in the tone of their reports. This is not surprising when the scale of prices that has ruled so long is considered. In response to the question as to how country owners are satisfied with present low rates, an old dealer says:—"There is a growl from many dairymen who, having enjoyed the taste of war-prices, find the settling action of quotations very unpalatable. Others promptly and tranquilly accept the situation by not placing a limit upon the discretion of their consignees, but rather urge them to keep stock moving." This is certainly the correct policy, as it is better to have this heavy early surplus handled here now, than for the market to go through the season chilled with that depressing specter known as "a large interior reserve." Exporters are helping the market to a noticeable extent, but they want the goods and some humoring in prices. In the way of exportation the presence of Canadian shippers is an encouraging feature Some moderation in general receipts has helped to make the market run higher, especially as the export sales have again been liberal. On Western butter, after noting steadiness for fine creamery, it must be remarked that all stock under the dairy and selected ladle packed factory, have an indefinate range of quotations,

Receipts for the week, 29,895 pkgs, ; exports past week, 8,802 do.

State creamery, choice, 19@20c.; other, 16@18c.; half tubs and pails, choice, 17@19c.; other, 12@15c.; Welsh tubs, best, 16@17c.; other, 12@15c.; poor State, 6@8c.; State firkins, 15@17c.; Western creamery, choice, 19@20c.; other, 15@18c.; Western dairy, best, 12@14c.; other, 9 10c.; factory (ladle packed), 10@11c.; other, 9@10c.; milled Western, 5@9c.; old and grease, 3½@5c.

BEESWAX.—A small business has been in progress at 26½@27½c. for Western and Southern.

Exports, past week, 14,900 lbs.; since Jan. 1st, 101,603 do.; do in 1877, 59,700 do.

BROOM CORN.—Small sales are taking place at 6@7c. for hurl and short brush; 5@6c. for medium green, and 4@4½c. for red and red tipped, per lb.

COTTON.—The spot demand has been active, and the market is stronger. Latest prices are: 11.56@11.57c., for June; 11.62@11.63c., for July; 11.17@11.68c., for August; 11.43@11.44c., for September; 11.21@11.25c., for October; 11.10@11.11c., for November; 11.09@11.10c. for December; 11.15@11.16c. for January; 11.21@11.23c. for February; 11.31@11.33c. for March; 11.41@11.43c. for April; and 11.52@11.54c. for May.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted:

	Uplands.	*Ala.*	*Orleans.*	*Texas.*
Ordinary	9¾	9¾	9¾	9¾
Strict ordinary	10	10	10¼	10¼
Good ordinary	10⅜	10⅜	10⅜	10⅜
Strict good do	10⅜	10⅜	11	11
Low middling	11⅛	11⅛	11¼	11¼
Strict low middling	11 5-16	11 5-16	11 7-16	11 7-16
Middling	11½	11⅝	11¾	11¾
Good middling	11 15-16	11 15-16	12 1-16	12 1-16

Fair	13⅛	13⅛	13⅜	13⅜

Stained.

Good ordinary....9¼c.; Strict good ordinary..... 10c.
Low middling.....10¼c.; Middling .....11¾c.

CHEESE—There is a considerable quantity carried over this week, receipts having been large. On other than special grades the feeling has been weak. Fancy white has suffered most in price, and after stumbling at 8¾ early in the week is now offered at 8¼ and the lower grades are a little easier. A good portion of demand has been for fancy colored lots, and they have been taken close to arrival, and at 8¾ all through the week.

Quotations are, for fancy, 8¼@8¾c.; 7½@8¼c. for good and prime; 6½@7c. for fair; 4½@6½c. for half skimmed; 2@3½c. for skimmed. State, farm dairy at 6¼@7c. for good to choice, 5@6½c. for fair to good and 2@3c. for poor skimmed. Wisconsin factory, fine to fancy, 8@8¼c.; do. good to prime, 7@8c.; do. fair, to good, 5¾@6¾c.; Western factory, fine, full cream, cheddar, 7¾@8c.; do. fine, full cream, flat, 7@7¾c; do. slightly skimmed, flat, 5¾@6¾c.; do. half skimmed, 4@5½c.; do. full skimmed, 2@3½c.

Receipts for the week, 90,513 boxes.
Exports, past week 80,322 boxes.
Gold closes at 100¾.
Liverpool cable quotation, 46.

DRIED FRUITS.—The general manner is still very slack, nothing being done outside of job lots, and an unsettled, easy, range of prices.

Peaches—Fancy North Carolina 11@12c.; Choice Georgia, 10@11c.; good to prime Georgia; 8@10c.; evaporated, 2@2½c.; unpeeled halves 3½@4½c.; quarters, 3¾@4c.; unpeeled evaporated, 7½@8c. Pitted cherries, choice new, 19@20c.; Raspberries, 27c. New York State plums, 11@12; Southern plums, 8@10c. Blackberries at 10½c. Apples—State quarters, 4@4¾c., do sliced, prime, 4½@4¾c.; good, 4@4½c.; Western quarters, 3@3¾c.; Southern at 4½@5c. for prime sliced; 3½@4¼c. for fair to good; Southern quarters, 3@3¾c.; Tennessee quarters, in bags, at 2½@3.

Exports for the week, 117 bbls. dried apples; since January 1st, 3,343; do, in 1877, 21,952.

EGGS.—Receipts for the week, 8,346 bbls.; do last week, 6,730 do. The market shows a fair summer style of business, though sales would be heavier if the weather were warmer, so as to bring out buyers for ice cream and pastry purposes. Prices have slightly but steadily advanced.

Near points, 17c.; State and Penn., 16@16½c.; choice Western and Canadian, 15½@16c.; a few off quality lots, 15c. Sales all loss off.

FLOUR.—The market has been steadily declining on full supplies, and the lower tendency for wheat. Latest prices are $3.25@4.00 for very inferior to very choice superfine State; $4.10@4.40 for very poor to very good extra do. odd lots and lines; $4.40@4.75 for good to fancy do.; $4.25@4.40 for very poor to very choice superfine Indiana, Iowa, Michigan, Ohio, &c., $4.00@4.40 for inferior to very good shipping extra do. and $4.40@5.65 for very good to very choice extra do.; common to about choice white wheat extras, $4.45@5.50; choice to very fancy do. at $5.00@6.75; red and amber winter wheat, inferior to very choice trade and family at $4.40@6.00; round hoop Ohio at $4.25@4.55, and trade and family brands of do. at $4.65@5.85, the latter rate for choice, (very choice to fancy lots quoted higher); St. Louis, $4.40@5.15 for very poor to good extra, and $5.15@6.50 for good to very choice, with a few brands of fancy quality quoted up to $6.75@7.00; Minnesota clear, very inferior to very choice at $4.40@5.85; Minnesota "straight," inferior to fancy, at $5.30@6.50, and patent poor to fancy at $5.50@8.00; unsound stock at from $2.00@5.00; city mill extra at $5 40@5.60 for fair to fancy for West Indies; do. for England, $4.15@4.25; do. trade and family extras, $6.00@7.25; do. for South America, $5.75@6.50 for fair to choice; No. 2 $2.25@3.25 for inferior to very fancy.

CORN MEAL.—Is selling at $2.80 for Brandywine, and $2.15@2.35 for yellow Western.

FRESH FRUITS.—The past week has given an elaborate display of fancy strawberries, and in some instances high prices were realized. As a rule, though buyers have aimed more for quantity than quality, and good table-sized stock has taken precedence in the sales. Most of the large berries have the drawback of tender quality, and if do not sell at holders' views the first day irregular prices are quoted next, as they are not tough enough to ship. This will be the case until we get a big variety to stand up like the hardy "Wilson." During the week we have had the novelty of "Seth Boyden's" Monarch of the West, Great America; Chas. Downing and Jocunda offering in wholesale lots. The New Jersey crop of market berries begins to run light. State berries piece out the supply, many coming from as far as Oswego and Oneida. Fancy berries sold on Tuesday 25@50c.; Up River, third, quarts, 3@4c.; N. J., quarts, fair, 4@6c.; prime, 7@9c.; Oneida, 9@12c.; Oswego, 11@13c.; whortleberries, quart, 12@15c.; Black Caps, 9@12c.; currants, red, 8c.; gooseberries are better quality, $1.50@2 bush.; cherries, fancy, 10@12c.; sour, prime, 6@9c.; good table, 7@10c.; common, 4@6c. The picking from adjacent points will be light, fruit having been severely damaged by rain and fog. Blackberries, 8@11c. Peaches are quite a feature and sell well. Ga. fine, bush. crates, $4@5; good to fair, $2@2.50; S. C., $1.75@2.50; N. C., $2@3. Hothouse grapes lower, Black Hamburg, ₱ 75c.@1.00. Peanuts held higher but dull; fancy Va. handpicked, $1.50@1.83; choice, $1.35@1.40; common to good, 90c.@1.25. Light receipts help the market. N. C. and Tennesee range at 90c.@1.25. A few Southern Red Astrachan apples sold at $3 per bush.; green, $1.50. Watermelons from Fla., $30@45 per 100, but hard to sell.

GRAIN.—A dull export trade, and the good weather for the crops, and the harvesting of the winter wheat taking place, with prospect of early increased supplies throw the market in the buyer's favor, and concessions in prices through the week have been quite liberal.

Latest sales of wheat are No. 1 white at $1.22@1.23½; white State at $1.23; New York No. 2 red at $1 10; No. 1 red at $1 14@$1 15; No. 3 red at $1; ungraded red at $1.03@1 08; No. 2 Milwaukee spring at $1.18; No. 1 Milwaukee and Minnesota spring, chiefly Minnesota at $1.10; No. 2 spring at $1.06@1.07; ungraded spring at 95c.; No. 2 Chicago spring, last half July, at $1,06¼; No. 2 red June opt'n, at $1.12; No. 2 Northwest spring, June option, at $1.07@1,08; do., July option, at $1 05; No. 2 spring, June option, at $1.07¾; do., July option, at $1.04½@1.05¼. Rye at 63@64c. for Western and 65 to 68 for State. Corn sales are of No. 2, June option, at 43¾@44c.; do. July option, at 45½c.; do., August option, at 46½@46¾c.; steamer mixed, June option, at 41½c.; do. July option, at 42½c; do., August option, at 45c.; spot lots New York No. 2 brought 43@43½c.; New steamer mixed at 41@42½c., the outside for a choice lot by rail; New York No. 3 at 40½@41½c.. Kansas mixed at 43¾@44c.; ungraded mixed at 38@46½c., and round yellow at 49c. Oats—New York No. 1 white at 35@35½c.; New York No. 2 white at 31c.; No. 3 white at 29½@30c.; New York extra at 31c; New York No. 1 at 30½c.; do., July option, 30½c.; New York No. 2 at 29½c.; white western at 30@30½c.; mixed western at 28@30½c.; No. 2 Chicago at 31c; No. 2 Milwaukee at 30c.; white State at 31@34½c.; mixed State at 28¾@30c.; New York extra white quoted at 35½@37c.; New York No. 1 white at 35@35½c.; New York No. 3 quoted 29c.

HAY AND STRAW.—The supplies continue liberal and prices are easy, especially for the lower grades.

Bale hay, 45@55c. for shipping, and 60@75c. for retail qualities; Straw quoted at 40@45c. for long rye, and 35@40c. for short rye; and 30@35c. for oat.

Exports, past week, 1114 bales; since Jan. 1st 30,700 do.; in 1877, 26,600 do.

HOPS.—Exports for the week, 1,245 bales. The temper of the market is stronger, and the better grades are in instances withheld. Fly has made its appearance in the English plantations, causing increased firmness in the London market. Reports from Germany are favorable for a large crop. Included in this week's exports are 500 bales of 1876s. Crop reports from the interior this week are less favorable. The cool weather hangs on, and the vine is making little or no progress. Quotations are for New Yorks, good to prime, 8@10c.; do., low to fair, 5@7c.; Eastern, 5@8c.; Wisconsin, 5@8c.; Yearlings, 2@3c.; Olds, all growths, 1@2c.; Pacific Coast hops, 10@12c.

LEATHER.—Hemlock sole at 19@20c. for light; 19½@21c. for middle; 20@21c. for heavy, and 17½@19c. for good damaged.

POULTRY AND GAME.—Added to the local demand for fowls there have been good wholesale sales for Havana, and prices have ruled quite buoyant for several days. Turkeys quiet; Spring chickens abundant and lower, quoted 18@20c. Western and Near Points.

Fowls.—New Jersey or Chulee, 12@12c; Southern and Western, 11@12c.; Roosters, 6@7c.; Turkeys, 9@10c.; Ducks, Choice, 12@7.c. pair, other, 40@55c.; Geese, N. J., $1.25@1 50; other, $1.00@$1.12.

Dressed poultry, quoted nominally for country packed as follows: Dry picked Phila., 13@14c.; other fair to prime, including N. J., 10@13c.; Spring Chickens, Phila., 26@28c.; Western, 18@20c.; N. J., 22@23c.; Phila, fowls, 13@14c.; other 10@12c.

Game has little variation from pigeons. These quoted, stall-fed, $1.25 doz.; flight, 80@85c. doz.; Squab, 65@70c.; small or nestlings, 40@50c. Tame squab abundant and unusually low, $1.75@2.00.

SUGAR.—Refined at 9¾, 9⅝ for cut loaf and crushed, 9¾ for powdered, 9⅝ for granulated, 7½@8 for soft yellow and 8½@9 for soft white.

SALT.—Sales at $2 50 for Ashton's; $1 05@1 25 for other brands of sack.

SEED.—Only the jobbing business usual at this late period. Clover quoted at 7¼@7½c. for Western and 7¼@8c. for State; Timothy at $1.30@1.40.

PROVISIONS—Export demand is better and the market closed up strong. Mess pork quoted $10@10 25 for spot lots; $10 for July and August, and $10 15 for September. Bacon at 5½c. for long clear and 5 7-16c. for short clear. Lard—Western steam at 7 07½c. for spot, June and July, 7 15; for August, and September at 7.25. Tallow at 7 1-16 for prime. Stearine at 7¾@7¼ for Western. Cured hams at $21@22. Beef—For extra mess, $11 75@12; plainmess, $10@11.50; packet, $12@13 for bbls.; extra India mess, $19@21 for city brands; do Philadelphia, $19.

VEGETABLES.—New potatoes have arrived so freely and sold so cheap that old have lost their late improvement. Common old, $1.00; Peach Blows and Early Rose, $1.25@1.37; with bbl. Bermudas also lower, $3.50 bbl.; new good to best, $2@3.50; Culls, $1.00. Very many Norfolks have turned out no better than culls, and by avericious shipment growers have lost money. Green peas were of poor quality until within a day or two, arriving puffed and poorly filled owing to cold and rain: L. I. ½ bush. bag, 50c.@$1.; N. J. bbl., $1 25@1.50; Md. bbl. $1.00@1,25; String beans, Nor. bbl., $2@3. Southern Cucumbers, crate, 75c.@$1,25; Squash, half bbl., $1@1.25. Cabbage, bbl., $1.00. Northern, per 100, $4@5; Asparagus, doz., Oyster Bay, $1.50@2; lower N. J., 75c.@1.25. Radishes, per 100 bunches, 40@50c.; Beets, do., $1.50@2; Rhubarb, do., $1.75@2; Lettuce, bbl., 25@50c.; Turnips, 100 bunches, $2@4; do., bbl., $1.50@2; Carrots, 100 bun. $1 50. New Orleans Onions, $2@2,25 per bbl. There has been a severe glut of Bermuda Onions and the market had to be relieved by sending them to Havana. Exports past week, 2,500 bbls. Bor. Tomatoes. 30@40c.; do., Onions crate, 50@65c.

WOOL.—Trade is yet quiet, and the advices from the West respecting the new clip indicate but little stir there. Only a moderate number of parcels changing hands, attended with but little excitement. The prices paid in the West for lines as they run of X and XX Ohio, have averaged about 30c.

LIVE STOCK MARKETS.

NEW YORK, JUNE 15, 1878.

BEEVES.—Receipts for the week, 11,044 head; do., last week, 11,780 do. Prices have kept pretty steady compared with our last. Common Texas sold at 6¾c.; good do., 7¾@8¾c. Native still fed, 9@9¾c.; useful to prime steers, 9¾@10¾c.; extras and top of droves, 10¼@10¾c. Export sales steady; 250 live cattle go abroad to-day and two cargoes of dressed. Several car-loads of bulls sold at 5¾@4½c. live weight. Texas has 30,000 head of stock for Kansas and Colorado this season.

COWS AND CALVES.—There is no market here; stock has been sent back to country owners,

VEAL CALVES.—Live have ruled high most of the week, and, though lower at the close, bring very satisfactory prices. Milk fed State and N. J., 5¾@7¼@c.; buttermilk, 4@4½c.

SHEEP AND LAMBS.—Receipts for the week 24,522 head; receipts last week 25,530 head. Market quiet for sheep, prices easy. The late range, 3¼@4¾c. Lambs sell fairly at 5¾@7¼c., the extreme for N. J.

SWINE.—Receips for the week 27,584 head; do. last week 26,806 do. Supplies mostly go to slaughterers; nominal yard rate. 3⅞@4c.; City dressed, 4¾@5½c. with light pigs, 5½c.

Automatic Cow-Milker.
I have the best and simplest milker in the world, made all of pure silver. It is easily kept clean, and has no flexible or rubber tubes to sour and spoil the milk in warm weather.
It is easily applied, and can be seen while milking that every teat is flowing.
Will milk sore or short teats, or kicker.
Fractious cows become very gentle by the use of my milker.
It is the cheapest, best and only perfect milker.
It never gets out of order—never wears out.
It will milk any cow very quick.
Price $3 per set; two sets, $5. Single Tubes, 75 cts.
Full directions. Agents wanted for every County in each State. WM. F. ELY, P. O. Box 226, Madison Morris Co., N. J.

***WEAK LUNGS** are cruelly racked, and the general strength gradually wasted by a persistent Cough, which Dr. Jayne's Expectorant may be relied on to cure. It will certainly benefit you also, if troubled with either Asthma or Bronchitis.*

Reading for the Young.

BABY'S TOES.

O, THE tiny, curled up treasures,
Just as cute as cute can be!
Come and help me count them, Madgie,
While the baby bends to see;

Peeps demurely over dainty
Skirts drawn up to dimpled knees,
Hey, my lady Lily! whose two
Roly-poly feet are these?

See the darling's round-eyed wonder—
Does she really know they're hers?
Now she reaches down to feel them,
While new triumph in her stirs.

Crow your fill, my little lady!
Those are your own cunning toes,
Round, and soft, and fat, and funny,
And—how many? Madgie knows!

Call them lily-buds to please her?
Madgie says they are too pink,
Say ten roses in two posies!
Rather rose-buds, don't you think?

Come, wee toes, lie still; be covered;
You've cut capers quite enough;
If you don't, we'll kiss and put you
Each one in a paper ruff. [*Companion.*

"POCKET-MONEY FOR THE YOUNG PEOPLE."—No. 7.

S. RUFUS MASON.

MANY country boys have a turn for mechanical pursuits, and there is no more extensive field than the country for its employment. One advantage this possesses is that winters can be very profitably employed in making the little niceties and conveniences so "nice to have" about the house.

Let a boy get a few boards, a few tools, and at his mother's suggestions, stock the house with stools, benches, towel-racks, towel-rollers, salt and knife boxes, clothes-line boxes, cozy corner-shelves, brackets, door-stoops, hat and clothes-pins, clothes horses, and a hundred other things which only a mother or aunty can think of, and when neighbors drop in, a home market is at once made.

There is a demand always existing for anything nice which we see at a neighbor's house. To be able to set a price promptly upon an article, count up the cost of the lumber and material used, and if articles are well made, the labor should be as much more. That is, if an article costs twenty-five cents for lumber, and twenty-five cents for hardware, nails, glue, etc., a fair price for a well-made article would be one dollar.

Here, as in farming or gardening, care must be used to make a good, strong job; then make it as neat or ornamental as the purpose it is for, demands.

In a neighborhood where flowers are raised in pots, in the house or garden, plant-sticks, trellises, and plant boxes for windows are in great demand. Here paint can be used and taste exercised.

In every locality certain things are constantly wanted, and in some, an artificial want may be created by some especial pursuit peculiar to that place. In such cases, ingenuity will suggest something new and appropriate, and a demand grows up at once.

There is no reason why a boy may not employ the summer in growing something for market, and the winter in exercising the mechanical proclivities; both are improving to the bodily, mental and fiscal condition of youth.

But I hear some one whisper, "Is there no way by which country *girls* can make spending money?" Doubtless, but I am not competent to advise, one of the fair sex will rise to the emergency, I feel sure, and thus the girls will not be dependent upon their brothers for pocket-pieces.

LETTERS FROM BOYS AND GIRLS.

Wild Cherries in June.

GOOD day, little Cousins; it was so pleasant I could not help coming to see you. Ah! here is "Slayerofconceit." Well, Master Slayer, you wish us to listen to reason, do you? If you have anything to say, say it, and, if it is reasonable, I am sure we would all be willing to listen; but it is getting almost too warm for bedquilts, and as for pie crust, something a little *shorter*, please. That will do for the present. I have a Grandma, who has passed her ninety-fifth birthday. She is as straight as an arrow, and as spry as a cricket. Her chief delight is in washing dishes. I wonder if UNCLE TRUE is as old as that. I guess not; and it is not likely he knows anything about dish-washing, unless he is some old Maid. I see there has been a deal of discussion on that subject. Now, I rather like old maids. Those I know are very fine women. Of course, there are some exceptions; but I think, as a rule, the most noble women are those who remain unmarried. Probably because they meet with no one worthy of them; for I do not believe the woman was yet born who could not have married had she chosen. Some of the Cousins may think I am an old maid, I am perfectly willing. Perhaps, though, I may as well tell my age. I am sixteen years old. Uncle TRUE says the controversy had best end. So it had, if the Cousins are going to a wordy war. I don't think they are, Uncle TRUE. It is good to write something that will advance each other in knowledge. But, for amusement, a good joke, now and then given in fun, and taken in the same way, can do no harm. Of course, we must say nothing that would injure one another's feelings; and now we have commenced the thing, we ought to carry it out in good style, and get angry at no one. Young "Teetotaler" seems to think I am proud. No; I am not. Perhaps he is, though. I hope he never forgets to put baking powder in his cake, for that would be a terrible mistake. I should not wonder if he intends to be a Bach, and keep bachelor's hall. I wish to ask a question: Can anyone tell me how often the word girl occurs in the Bible, and where found? Good bye, Uncle and Cousins; I will call again some day. WILD CHERRY.

Jim Crow.

DEAR COUSINS:—I see you are just as full of fight as ever and I do not prefer any treaty of peace. I want to fight some, for you know if there is a skirmish going on "everybody wants his fingers in the pie." UNCLE TRUE very kindly printed my other letter and that encouraged me. I am much obliged to BROWN BADGER for inquiring about me. The work and study has not made me quite sick yet. You all seem down on "*Slayer-ofconceit*." He has one ally, however, and I hope that ALICE V. will prove a most powerful one. Young Teetotaler was speaking of the length of time her father has taken the RURAL. I think I can beat her there, for my father has taken the paper ever since it first started. I will say that I am also a teetotaler, and if we were together I think we should shake hands on it and be friends.

Perhaps some of the cousins would like to hear about the State Normal School here, and those living where there are others will perhaps tell me if it is like theirs. There are three departments in it, viz: Normal, Intermediate and Primary. In all there are about five hundred scholars. The majority of the scholars are representatives of the female sex. There are five professors and seven lady teachers. Each of the lower departments has a Principal and Critic, and there is a General Superintendent of both. Nearly every thing is taught in this school from the A B C's to Hebrew, if any one wishes to learn it. The School Grounds occupy about three or four acres in the center of our village, and were first fitted up to have scholars from abroad board in the building; but that plan was soon given up. Well! I think I have said enough about our school, and I also think that some of my friends may recognize the place and writer. I hope "Hawaii Nei," "Madcap Mollie" and "Slayerof-conceit," will write again. JIM CROW.

A Nice Little Girl.

UNCLE TRUE:—My father has often told me, when I entered a strange place, to address the gentlemen of the house first, and afterwards the children. I will do so now, and tell you who I am and what I came for. I am a little girl that has been much interested in reading your paper, going round with you every week to see how you cared for your flowers and shrubs, and doing everything in such a nice way it made me want to be practical too. I commenced at 5 years old to follow your directions about the transplanting, and can now do it without fear of failure. and I have come in as a Rural Cousin to thank you for telling us so plainly the best way of doing everything. Please accept my thanks for the little "Cricket." It arrived in due time, in good order, alive and chirping, and as I sit here writing my acknowledgement, it occupies a place on my table, and seems to be a vigorous little worker. We are very much pleased with it, and it is admired by all who see it. Dear Rural Cousins if your ring is not already full please accept me as one of your number, for I am much interested in your columns, and will help you work for the good old RURAL and the little Cricket. MARY E. WRIGHT.

Tuscola Co., Mich.

How to Make a "Squaker."

DEAR UNCLE TRUE:—I have been reading LILLIE LEE'S interesting letter, and I thank her for the information she has given. As I look over the letters, I wonder what has become of the boys. Perhaps I can tell. Down by the river among the willows making whistles, or on the bank, rod in hand, with an anxious look on the face as the first faint nibble is felt, which suddenly changes to joy as you land a shining—shinner. Aye, to boyish minds the rod is mightier than the pen. Or, perhaps, in the swamp among the alders hunting the cat-bird's nest; or in the field, driving the hay-rake; or, worse than all, in the meadow picking up stones. Now that I have found you, I will tell you how to make a "squaker." Two pine sticks of equal length, about two inches long by one-quarter wide, and the same in thickness. Hollow out one side of each stick so that when put together your knife-blade will pass between them. Take a blade of grass and put between the sticks, stretched across the opening between them. Place the sticks between your teeth and blow!

MENZER.

Long Wished To Join Us.

DEAR COUSINS:—I have long wished to join you I hope UNCLE TRUE will not criticise me too severely. I am very glad a few have come to their senses, and will say one good word of Slayerof-conceit. Perhaps he does not ask for pity, but I think he needs it. I hope he is not frightened from the field. The letters from HONOLULU are very interesting. Will our Cousin tell us something of the government of that country? May I ask some questions? Hoping that you all say yes, I will begin. 1. Where does Dr. J. G. Holland live? 2. What form of government has France at the present time? 3. Is it profitable to read any style of novels?

We have taken the RURAL for a number of years. We intend to send for it and the "Cricket" this year.

Espyville, Pa. KIT.

[1. Dr. Holland lives in New York City. 2. Republican, Marshal MacMahon is President. 3. There will be a series of articles presently on this subject.] U. T.

From Ohio.

DEAR RURAL COUSINS: I stand at the door waiting for admittance: will no one bid me enter? Thanks for at last admitting me, I have long wanted to be one of your number, but feared to try lest I should not be received into your circle. My father has taken the RURAL ever since I can remember, and I think it is the best of all papers. I live on a farm and have a delightful time. I hope to hear from our Swiss cousin often, and think he ought to write and tell us all about his country, I have often read of the beautiful lake and mountain scenery and would like very much to see some. I want to give the RURAL Cousins a word of advice: write often. DEW-DROP.

The First

PLEASE UNCLE TRUE and Cousins, may I come in? I have been much interested in reading the letters, and have been longing to knock and ask admittance. I don't think I am any smarter than many boys and girls who do write, but I think I am smart enough to try, and if this finds a place in the paper, I may write again. I am a country girl, and am glad of it. I live on a farm and have plenty of work to keep me out of mischief. I am fourteen years old, and go to school. We have a new school-house, a mile distant, and I have'nt missed a day, this winter.

APPLE BLOSSOM.

The Puzzler.

HIDDEN APPAREL.

1. THE cigar terrified me.
2. He was shut up in a forecastle.
3. She was a wine bibber.
4. I saw the ruins of Babel tower.
5. His ash tree gave good shade.
6. A truffle is a species of mushroom.
7. Sand always tickles my throat.
8. In Japan Nic Raymond died.
9. They had a scuffle.
10. Make no idol, man, for 'tis a sin.
11. Why not shir this trimming?
12. He broke his hoe.
13. I can't say boo to a goose.
14. His lip performed its duty.
15. I dislike this mockery.
16. Push, if the crowd presses.
17. Your lunch, Em., is elaborate.
18. Buy me a bassock, Samuel.
19. His pence-robber is under arrest.
20. I have a sick stomach, Ervine.
21. Draw Ersie's sled up the hill.
22. Can you usurp license?
23. I must suspend, Ersena.
24. Stop, Olan, also your gizzard.
25. The gold was a red ingot, Eva.

Sabbath Reading.

PARADISI GLORIA.

"O frate mio! ciascumana e cittadina
D'una vera citta——." [*Dante.*

THERE is a city, builded by no hand,
And unapproachable by sea or shore,
And unassailable by any band
Of storming soldiery for evermore.

In that pure city of the living Lamb
No ray shall fall from satellite or sun,
Or any star; but He who said "I Am"
Shall be the Light. He and His Holy One,

Nor shall we longer spend our gift of time
In time's poor pleasures—doing petty things
Of work or warfare, merchandise or rhyme,
But we shall sit beside the silver springs.

That flow from God's own footstool, and behold
The saints and martyrs, and those blessed few
Who loved us once and were beloved of old,
To dwell with them and walk with them anew.

In alternations of sublime repose—
Musical motion—the perpetual play
Of every faculty that heaven bestows
Through the bright, eternal day.

THE CROSS OF JESUS CHRIST.

D'AUBIGNE.

[JEAN HENRI MERLE D'AUBIGNE, D. D., came from a French Huguenot stock, that accounted life well spent in upholding evangelical religion. His great-grandfather had to fly to Geneva at the revocation of the Edict of Nantes; and his grandfather was exiled to the same city in old age. Here Jean was born, August 16th 1794. His theological studies, commenced at Geneva, were completed at Berlin, under the celebrated Neander. After a pastorate in Hamburg, and later in Brussels as chaplain to King William, he returned to Geneva in 1830. At once he was appointed president of its new theological seminary, and vice-president of the Evangelical Society. His great work is, "History of the Reformation of the Sixteenth Century, in the times of Luther and Calvin," of which nearly a half million copies have been sold. It is an eloquent, pious, and important portraiture of those thrilling times. His appearance was noble and commanding; his vivacity keen, and energy exhaustless. He died in Geneva, October 21st 1872.]

"*But God forbid that I should glory, save in the cross of our Lord Jesus Christ.*"—Gal. vi. 14.

MY brethren, God has not intended that men should be deprived of all boasting. A disposition to boast is one of the propensities most peculiar to our nature, and which we find in all classes of society and among all varieties of the human race. From him who stands on the highest elevation in the world down to the most unknown; from the inhabitants of our cities, whose spirit towers on high, down to the very savage, whose reason is scarcely observable; all find something of which they believe that they may boast. And what is it then? A ridiculous plaything, of which they should blush, instead of making it the object of their pride. Oh! sad spectacle of our vanity, which proves with the greatest precision that the human race has lost that in which it could glory, that it has come short of the glory of God (Rom. iii. 23); and that in this great need it stretches out its hand to the first plaything that it finds to put it in the place of the reality which it wants. Thus the inhabitant of a city in the utmost state of famine seizes with desire the most loathsome food, from the very sight of which at any other time all his senses would have revolted.

God would give men an object in which they could better glory. He has given them the cross of Jesus Christ.

"God forbid that I should glory," says St. Paul in our text, "save in the cross of our Lord Jesus Christ." And through these words he pronounces the sentence of condemnation against all deceitful things, which are in general our idols; he commands all men to cease from their vain endeavors, and he exalts the cause of Jesus Christ, as the only object worth glorying in for all intelligent beings till the end of time. But when the apostle says *in the cross of Christ*, think not that he understands thereby the wood, the outward sign, the figure which one meets so frequently in many regions of Christendom, and which has been so often abused by superstition. He intends to denote thereby the death of the Son of God, which took place when the fulness of the time was come for the remission of our sins. But he uses the expression *the cross* only to remind us that this kind of death was held as accursed among all people, that the death in which we ought to glory was full of humiliation, shame and ignominy, and even accursed of God.

THE more any man improves his graces, the clearer, the sweeter, fuller and richer is his enjoyment of God here. There is no man in all the world who has such enjoyment of God as the man has who most improves his graces. It is not he who knows most, nor he who hears most, nor yet he who talks most, but he who exercises grace most, that has most communion with God, that has the clearest visions of God, and that has the sweetest discoveries and manifestations of his Lord and Master.

MANY are miserable by loving hurtful things; but they are more miserable by having them. It is not what men enjoy, but the principal from whence it comes, that make men happy.

WHERE grace is improved to a considerable hight, it will work a soul to sit down satisfied with the naked enjoyment of God without other things.

PERSONAL ITEMS.

The wife of Senator-elect George H. Pendleton, of Ohio, is a daughter of Francis Scott Key, author of the "Star Spangled Banner."

During Mr. W. H. Vanderbilt's recent stay of a fortnight in Paris, he purchased pictures of celebrated artists to the amount, it is said, of $200,000.

Senator Oglesby, of Illinois, is a muscular man, who is brusque, heavy, practical and sensible. He and Senator Booth are great friends. He was at one time a miner in California.

Congressman McMahon of the Investigating Committee appears resolute. Behind his professional austerity he seems to have genial qualities. Men with big ears are usually generous.

Jeff. Davis has just been made rich by a decision of the Mississippi Court of Appeals awarding him a large plantation for which he once paid his brother, but did not secure a legal transfer, and which his brother (now deceased) afterwards sold to a negro for $300,000, though he left evidence that Jeff. had paid for the estate.

"Miss Grundy" has the grace to say of Mrs. Fremont, daughter of the late Senator Benton that she has had what rarely falls to the lot of any—a beautiful youth, followed by no less a middle age. Her hair is now as white as snow and very abundant, and her fresh complexion and animated play of features combine to make her one of the most distinguished-looking women ever seen.

Pope Leo XIII. is thin even to meagerness, and tall. His fingers are almost fleshless, and his whole figure and the outlines of his face ascetic to a degree. His hands are tremulous with nervousness. His voice is clear and ringing; his sentences are long, but admirably arranged. He has a noble head, crowned with snow-white hair; a high, wide forehead, not smooth and shining, but rough with bumps which would delight the heart of a phrenologist; eyebrows bushy and overhanging; deep-set, kindly, and intelligent eyes; a large—very large—nose, thin and fine; a wide mouth, which leads itself most readily to a very attractive smile, deep straight lines bounding it; and good, clear, pointed chin, with well-defined, firm jaw. He is remarkable for his kindly and courteous manners, his gracious speech, and the affectionate interest he takes in those with whom he comes in contact.

Wit and Humor.

FISHING, IN FIVE STANZAS.

Now digs the boy the garden plot,
With energy intense,
Until he bags a tribe of worms,
And then he skips the fence.
[*Yonkers Gazette.*

Then off he skoots to where the stream
Doth ever gently swish;
And with much patience, and his hooks,
Entiecth sundry fish.
[*Hackensack Republican*

And then with slow and wary steps,
Homeward doth he wend—
When he is led to a back shed,
And frightful cries ascend.
[*Norristown Herald.*

But when at last the job is done,
With all his father's might,
The boy with pain and sorrow cries,
"I did'nt get a bite."
[*Grand Rapids Democrat.*

"The boys all laughed at me and said,
"My *bait* was cut for perch,
But now I wish that I was dead,
"For I've been *bate* with birch."

THE greenback party—Live lobsters.

THE jail bird—the robin. [*Utica Observer.*

WHEN a dog is muzzlod his bark is on the tied.

PEOPLE with colds in their heads belong to a generation of wipers.

A VOLUME that will always bring tears to your eyes—A volume of smoke.

A MULE'S hind leg has only one season. It is always a beautiful spring.

FATHERS with marriageable danghters, look into this matter. Does investigation invest a gate?

MRS. PARTINGTON says that her minister proached about tho "parody of the probable son."

SENTIMENTAL young grammarians are very apt to parso "love" as a "fine-night verb."—*Courier-Journal.*

LITTLE boy at the opening of a proposed spelling match: "Let's start fair, grandmother. You take Nebuchadnezzar, and I'll take cat."

MRS. PARTINGTON says she was much elucidated last Sunday on hearing a fine discourso on the parody of the prodigious son.

A FRENCH paper points out how the passion for gambling is showing in England, so that even in wedding notices it is necessary to state that there aro "no cards."

UNDUE indulgence in strawberries gives people tho hydrophobia. (This appalling lie is promulgated with a view to bringing strawberries down to four cents a quart.)—*Hawkeye.*

THAT was an unfortunate, fatal song, thoy started some yoars ago. "Tramp, tramp, tramp, the boys are marching," they sang, and there has been no end of tramps ever since.

"DAD, have you evor beon to the museum?" said a ten-year-old. "No, my son." "Well, go and mention my namo to the keeper, and he'll take you round and show you everything."

WHEN a woman makes up her mind that a hen shall not sit, and the hen makes up her mind that she will, the irresistible meets the immovable, and every law of nature is broken or perverted.

Eating is a Torture,

And sleep often a mere travesty of repose, to the dyspeptic. Appetite is correspondingly impaired by this most prevalent of maladies, and headaches, biliousness, constipation, poverty of the blood, loss of flesh and of vitality, and a thousand annoying and indescribable sensations, are its concomitants. It is, moreover, the progenitor of numerous and formidable bodily disorders. Obstinate as it is, however, its complete eradication may be effected by tho persistent use of Hostetter's Stomach Bitters, a medicine which communicates both vigor and regularity to the organs of digestion and secretion, relaxes the bowels gently but thoroughly, enriches and purifies the blood, promotes appetite, and gives tranquility to the nervous system. Persons of weakly constitution and feeble physique who use this superb tonic infallibly derive from it the stamina of which they stand so much in need, and it is invariably successful in remedying and preventing malarial diseases.

CAUTION.

THE NEW

"CHARTER OAK" LAWN MOWER

The most beautiful and perfect Lawn Mower in the world. It stands to-day at the head of the list of Lawn Mowers in the United States and Europe.

The machine is mounted on two large driving wheels or pulleys and instead of being on the outside of the frames, to run in the uncut grass, like all other wheel-mowers, they are placed *inside the frames*, back of the cutting-blades, running on a shaft, each independent of the other, allowing the machine to be turned either to the right or the left without injury to the sod, and to be turned around in a circle no greater than its own length, and cutting at the same time.

One very important feature is its three-bladed solid revolving cutter, working in patent boxes, so constructed that grass cannot wind around the shaft of the cutter, which overcomes a serious objection in most all other Lawn Mowers.

It is a model of beauty, very compact, beautifully finished and thoroughly made; it is durable, easy to adjust, operate and keep in order, and the driving wheels being inside the frames, enables the operator to cut the grass clean around walks, drives, flower beds, trees and shrubbery. BE SURE AND SEE IT BEFORE YOU BUY.

Manufactured in five sizes for hand, viz., 8 in., 10 in., 13 in., 15 in (Standard), and 18 in.; and two sizes for horse-power, viz., 28 and 30 inch.

Winter Sketch — WEEPING BEECH. — By L. F. Graether.

Arboricultural.

THE WEEPING BEECH.

(Fagus Sylvatica Pendula.)

The remarkable tree, of which we give an illustration from life upon our first page, is one of world-wide celebrity; and justly so, for it combines as many of the qualities for which ornamental trees are admired as any other specimen of which we have any knowledge. Engravings of this tree have been published before, not only in this country but in Europe. But all represent it in full foliage. The outline is then so peculiar—the covering of leaves so dense, that one, as he approaches it for the first time, is ready to ask, "What is it?" A great mound of dark-green, glossy leaves; a gigantic bower of vines will, perhaps, suggest themselves in answer. Few branches are seen through the foliage, which sweeps the ground about its entire circumference, and he gazes in actual wonderment and admiration as the fact reveals itself that it is the undirected, unaided growth of a single tree. Pushing away the branches and leaves so as to effect an entrance, he finds himself beneath a darkened canopy, through which only the softened light transmitted through several layers of foliage can enter. Then above and about he sees something of the framework which by our engraving, drawn in mid-winter, we have attempted to portray. The following letter from the owner of the grounds in which this tree grows, explains itself:

Flushing, N. Y.

Eds. Rural New Yorker:—The artist has certainly given a very faithful portraiture of the Weeping Beech, and must have bestowed upon it much labor. You are certainly doing a good work in giving to the reading public the portraits of so many of the finer trees and plants; and I am very glad to have presented in the pages of The Rural New Yorker this faithful representation of one which I so much admire.

It was planted where it now grows, on the old grounds of the late firm of Parsons & Co., at Flushing, in the year 1843, and is now at least forty feet in hight. It differs from many of the plants of this variety, which are grown in Europe, in being worked near the ground, and thus having a different character from those grafted high, which possess the umbrella-form of the ordinary Weeping Ash and Willows. Though not of slow growth, yet it, of course, does not reach up as rapidly as when younger. Yet year by year we see an advance in its size and beauty; and among the many fine specimens here, there is not one which so quickly attracts the gaze and admiration of visitors.

Robert B. Parsons.

Mr. Frank J. Scott, in his fine work, "Suburban Home Grounds," presents one of the best portraits of this tree in foliage we have ever seen, and speaks of it as follows:

"We consider this (Fagus sylvatica pendula) the most curious tree of our zone, and one that will commend itself more and more as it becomes known. The original tree stands in the park of Baron de Man, at Beersel, Belgium*. The trunk is three and a-half to four feet in diameter, and grows in a twisted form to a hight of twelve to fifteen feet, with an appearance as if an immense weight were pressing it down. The branches cover an area nearly a hundred feet in diameter. Its history is curious. Some sixty years ago the baron's gardener was planting an avenue of beech trees, and the baron, observing a very crooked specimen, directed to have it thrown out; but the gardener planted it in a corner of the grounds little visited, where it grew to be one of the most beautiful and singular freaks of sylvan nature." Mr. Scott then refers to his engraving of Mr. Parson's tree as the finest in this country. It is impossible for any engraving to do justice to its eccentric luxuriance. It is the very embodiment of all the odd freaks of growth that make trees picturesque, and the vigorous healthfulness of foliage that makes them beautiful.

Mr. Meehan, to whom we sent a hand proof of our engraving, replies as follows:

Germantown Nurseries,
Germantown, near Philadelphia.

Eds. Rural:—I am glad to see your beautiful drawing of Parson's Beech. I have always had a great admiration for this tree, but your drawing hightens it.

I believe when it was first found among a lot of seedling Beeches in some nursery in Europe, the attendant threw the scrubby thing away; and it was only some ignorant person, to whom a tree was a tree and nothing more, who snatched the brand from the burning. If that attendant is still living, I hope he will not see the Rural New Yorker, for if he is a true lover of trees, it is enough to drive him to suicide to note how nearly we were deprived of a good thing by his stupidity. Very truly,

Thomas Meehan.

We have only to add that this beautiful variety of Beech, which we hope our readers by this article may be induced to plant in the choicest situations about their homes, is of slow growth during several years after transplantation. Our best specimen was planted five years ago, and is now nine feet high. It is not until it is about ten years transplanted that it fairly begins to show its beautiful eccentricities.

PROBABILITIES OF AMERICAN GRAPES.

D. S. Marvin.

The history of our native Grapes would be a theme full of general interest, but I cannot here take it up for want of time and space, further than to say that it would throw light upon what I have to say of their future, and give a better understanding of the subject, and that the persistent attempts to utilize Vitis vinifera, the European grape, for out-door cultivation upon our Atlantic seaboard, has been a long history of disaster, for the class is not adapted to our climate. To obviate these difficulties, some twenty-five years since, horticulturists conceived the idea of hybridizing the European sorts with our wild and then despised natives. Much labor has been expended in this direction, and time enough has elapsed to enable us to see that this method is more or less a failure. These hybrids are only healthier than vinifera vines, inasmuch as they are dominated by the higher vigor of our native classes. We can hardly say they are a success, or that they have met the hopes of their originators. The elements of weakness still exist, only in a less degree.

It is therefore becoming generally recognized that we can rely alone upon our natives, and bring them up by the ameliorating circumstances of improvement by cultivation, and the arts, appliances, and skill of the horticulturist, to the standards of European Grapes, and doubtless, in time, beyond those, in some respects. We have not far to travel even now. In the matter of health, we are ahead; for wine and table purposes, nearly equal; but behind for raisins: ours may never be well adapted to this purpose from lack of pulpiness. When we reflect that the European has received careful attention and cultivation from the earliest records of profane and sacred history, and our own but for a single generation, and when we further contemplate how much can be accomplished in this direction, how pliable nature is in the hands of the skilled horticulturist, we are not without hope that our healthier classes and varieties may yet come to the rescue, and reclothe the sunny hills of Europe, devastated by Phylloxera vastatrix, Oidium Tuckeri, etc.

The writer hereof, having made this subject of amelioration, in its several departments, as thorough a study as was in his power, has determined to publish the story of his processes and their hopeful results, and to suggest such further processes as seem promising. To save repetition, he would respectfully refer the reader to a partial record, in an article published in the Rural New Yorker for April 13th, last. This is done because he considers the improvements already accomplished important, and the processes, some of them, new and original, and pointing the way to more hopeful results hereafter. He is already past the meridian and on the downward slope of life, and although he is sanguine and more hopeful than ever in going on with the good work, still he recognizes that human life is a thing of a day; that the processes devised may be an aid and encouragement to others in their efforts and achievements in the same direction; that there should be a brotherhood, an unselfish spirit herein manifested; that no one man knows it all, or should selfishly think he can monopolize, or make worldly gain to the exclusion of others; there are, too, so much valuable time and labor lost in repeating old and unhopeful experiments over and over again, and this would not be done if there were to be found an accessible public record of what had already been done by others.

There has been great loss of effort for want of proper attention to the great, I might say, profound and dominant, influence of the stock upon the germ or seed from which the new seedlings are to be grown. We know that normal seedlings will repeat themselves over and over again, true to the original; that the only gain we may ever expect is from rare occasional tendencies to sport, through changed circumstances of soil and climate. Our whole effort must, then, be concentrated upon this one point—*increasing the chances of sporting under propitious circumstances.* This is the alphabet, the beginning, and must be more profoundly studied. Cultivation, grafting, hybridizing, are but the accessories. Too much study cannot be concentrated here; every means within Nature's resources, and the skill of man, will be needed.

Europeans have not recognized the promise of our Grapes—old prejudices and prepossessions are slow to give way. So far they are only using the roots of our vines, upon which to graft their own; they have not sufficiently tested the fruit of our finest varieties; there is little wonder that the coarser Labrusca and cordifolia varieties disgust them; they should test some of the more promising æstivalis and vulpina sorts. Let the ingenious countrymen of Lafayette, who have the reputation of being skilled horticulturists, look into this matter, and recognize the possibilities and capabilities of our best classes and their varieties. Herein is a wide and profitable field for exploiting, and we want their help.

Our native resources are far greater than those of Europe. They have but one botanical class under cultivation; we have four or more already cultivated and adapted to widely differing climatic conditions. Advantage should be taken of the choicest varieties of these several classes; their individualities more clearly studied; their best features selected and concentrated.

Grafting to vary the result, has not, to the writer's knowledge, heretofore been used in these operations. In his hands it has yielded the most surprising and gratifying results. Every skilled horticulturist has observed the difference between a seedling from an ungrafted apple and a grafted one. Here is the most potent means to be used to effect the desired result. I am amazed that so simple yet important a factor has been so long unthought of. It only shows how crude we still are in this interest. By this means, as well as by hybridizing and marching, we are enabled to blend the sap of all the known different botanical classes in the production of a single seed, and the chances of forcing sports are greatly multiplied.

Horticulturists have heretofore taught that hybridizing was the great potent means to be used to bring about the highest results. I have not found it so in my limited experience. In skilled hands, its use is great; the seedlings are generally of the mixed nature of their parentage; but they are seldom an improvement over both, and their seedlings rarely yield seedlings of a mixed nature to carry on the improvements, but go back to the strongest parent. The power that grafting yields by blending the sap, is wanting. It is root power, not sexual force, that seems to give us high-bred seedlings, just as the good blood of the noted breeds of horses perpetuates their qualities. The hybrid between the horse and the jack is the well-known impotent mule, totally unable to perpetuate its species—a useful animal, but noted for its stupidity and intellectual inferiority to either of its parents.

Success will depend very greatly upon the judgment, experience and skill of the operator, in selecting the best classes and the best representatives of each class. I have long desired to go into our southern maratime districts, where alone the Scuppernong flourishes, to avail myself of the great advantages of our Vitis-vulpina class, which is reported to be exempt from phylloxera, and, by mixing, yields the genuine sparkling Catawba wine. This great field is almost unexplored; splendid results doubtless lie at the very threshold of experimentation there; but it requires a trained mind to see its advantages, and where to operate. One human life is not long enough to do all that should be done.

There are few men so situated that they can learn processes that require so many years' experience, because the business of most persons so interested, must be made to maintain them while doing it. Some well-endowed agricultural institution, or the general Government, should take the matter in hand. The Grape is but one among the many of our fruits, vegetables, and cereals, requiring further development. There is hardly any limit to the power of man over these ameliorating, developing, I might almost say, creating processes. Agriculture, which embraces, of course, horticulture, instead of being a series of hap-hazard processes, must become an applied science, with trained minds, instead of boors, to do its work of developing our fruits and seeds until they are greatly improved in quality and increased in productiveness.

Industrial Topics.

THE EXPORTATION OF FARM PRODUCTS TO EUROPE.

Professor Levi Stockbridge.

From an early day in American history, farm products in the form of food supplies, or textile and other raw material for manufacture, have been to a considerable extent shipped abroad. But the volume of the outgoing goods has rapidly increased in quite recent times, especially in food products, and is now of gigantic proportions. Not only from all our leading Atlantic seaports, but also from our Pacific coast, many huge steamers and sailers are weekly, if not daily, leaving for European marts with packed cargoes. They carry out cotton, corn, wheat, flour, barreled beef and pork, hams, bacon, lard, butter, cheese, apples, canned fruits, meat and vegetables, and live and dressed beef and mutton. In the aggregate, the value of these must amount to many hundreds of millions of dollars, and be more than double that of all our other exports.

This branch of our foreign trade has increased so rapidly of late as to awaken and fix the attention of all classes of commercial and financial men and associations, who unanimously predict that if it continues, it will lift the nation in all its interests from their present embarrassed condition, give employment to all desiring or willing to labor, and general thrift and prosperity.

What, then, is the prospect for the future? Will the foreign demand for commercial food continue, or is it only temporary in its character, and soon to cease in consequence of home supply? In answering this question, we may throw out of the account the demands from South America, from China and other countries of the East, which are quite large and will probably continue; and direct our attention only to Europe.

The war between Russia and Turkey has, undoubtedly, decreased the grain product of those countries and made some disturbance in the general market of Western Europe. But peace there is not likely to stay, or cause the ebb of, the present great grain tide in that direction. With our vast expanse of cheap land which is or can be made fertile to the point of profitable grain production, with all our superior labor-saving machinery for tilling and harvesting farm crops, with such unparalleled facilities for quick and cheap inland and foreign transportation, just brought to systematic perfection, we have nothing to fear from Russia, Hungary, or Austria in our present *grain* markets, and for the market in certain other great lines of our export, they cannot compete at all. But, again, the demand in our present market, it is almost certain, cannot be met by their home supply. Notwithstanding their intensive culture, large yields, and large carrying capacity per acre, the lands of the British Islands, as now distributed and occupied, cannot supply their population with healthful food in sufficient abundance and variety, and they must, from necessity and self-interest, continue large purchasers from us.

On the Continent, France, Germany and adjacent countries, whose agriculture, in many respects, is altogether superior to ours, especially that of France, which country may be said to be a nation of land-owners, of thrifty small farmers, the people have discovered that there is a large class of American exports, particularly of cattle and their products, which, owing to the value of their land and the size of their farms, can be more cheaply obtained here than by home culture. They will, therefore, buy such supplies of us, and turn their own farming largely into other channels.

Here, then, on the right hand and on the left, in the East and the West, are, and are to be, the demands—our markets. Can we produce enough to feed ourselves, and a surplus to meet the demands? Yes; we undoubtedly *can*, if we will. It is true that the general soils of the old States of the Union, for hundreds of miles inland, have been robbed of their original store of plant-food by the most improvident and thriftless methods of culture, and do not yield one-half as much per acre of many products as the lands of some countries to which we export. But the soil is here full of the *elements* of fertility ready for development into plant-food by judicious tillage, the *acres* are numberless and comparatively cheap, and we have the vast and almost untouched West with its accumulated store ready for immediate change into the form of crops, and the hands and machinery needed to accomplish it. Yes, we *can*, but will we?

Out of the very lowest depths of financial disaster and ruin, agriculture all unaided and unrecognized, with hundreds of thousands of able-bodied idlers in all parts of the land, who are useless as a laboring force, is even now lifting us to prosperity and giving hope and cheer to the despondING. The wild and reckless adventures, the fool-hardy schemes for acquiring sudden wealth outside of legitimate labor and business, induced by the monetary disturbance caused by the late war, had a most demoralizing influence upon all our producing industries. But the bubble has burst; fortunes real and imaginary have disappeared; and now our people are ready to engage in legitimate industry, not for the purpose of acquiring wealth to be expended in ostentatious and extravagant display, but for a rational livelihood. In this emergency, to the land where there is room enough, and labor enough, and food enough, and a sure competence for all who seek it, their attention is turned. If wisdom now is our guide, this tendency will be reinforced and strengthened by wise and judicious legislation of the States and nation, and by all the force of public opinion until the desire becomes fact.

If agriculture with the depressing, discouraging influences which have been bearing upon it, is even now the main cause of our returning prosperity, what may we not hope for and accomplish, if it receive the labor and encouragement its importance demands? The changes taking place at the present time point in this direction, and indicate that in the future we shall find this industry our great producer, its surplus above consumption the source of our increasing wealth, which surplus will seek its market on the other side of the Atlantic. Assuming this to be the fact, the influence it may have on our soils and their future producing capacity, becomes a matter of serious importance.

To export from a county grain, meat and other agricultural products, is simply to send away, to banish forever, those elements on which good farming has ever relied to maintain the soil's capacity of production. And unless the same elements in kind, availability, and about the same proportion, are substituted in other forms, the final result must be disastrous. With a knowledge and full appreciation of this fact, however, such consequences may be avoided. For we have in every part of the country, as natural or accumulated deposits, vast quantities of material, both mineral and organic, rich in fertilizing elements, now going to waste or little used, which by care and intelligence can be utilized for the purposes of plant-food. Chemistry, too, is just opening to us a measureless mine by the manufacture of the salts of the elements of nutrition, which are as effective and permanent in the production of farm crops, as the refuse of the crops would be if consumed at home.

The conclusion, therefore, appears to be just, that whatever may be the foreign demand for food-products, we have the soil, the labor, the machinery, the means of transportation to supply it. And by the practice of an intelligent course of husbandry, by the use of our natural and artificial advantages, the present producing power of our soils may be retained, and even increased and unequaled permanent national prosperity be the result.

Horticultural.

THE BANANA.

WILLIAM FALCONER.

BANANA plants are indigenous to the tropical world where they are widely distributed and have been cultivated for their fruit by savage as well as civilized peoples, from time immemorial. The amount of fruit they bear, in proportion to the ground they occupy and the care they receive, is enormous; and they are almost the sole sustenance of millions of human beings. In Florida, and some other parts along the coast of the Gulf of Mexico, banana-raising is quite an important industry. A gentleman of Tallahassee, Florida, writing to me a year or two ago, said: "Banana plants are worth 25 to 30 cents each. They come from suckers from around the old plant. Each plant will give from eight to ten yearly. We plant 435 bearing plants to the acre, and they bear fruit from fifteen to eighteen months after being set out."

Musa sapientum is the banana of commerce, and M. paradisiaca the plantain. Both of these species are so nearly allied, that some of their varieties defy botanical distinction. The banana plant has purple spots on its stem, and its fruits are shorter and rounder than those of the plantain. But in cultivation there are varieties of both species that are greatly superior to the originals. There are many species of Musa, however, and all useful in their way. Besides those mentioned, the Chinese banana, M. Sinensis [see cut], is a dwarf, quick-growing and heavily-fruiting species that, in some of the British colonies and Pacific islands, is being successfully cultivated. This is the kind most generally met with in greenhouses. All the Musas contain a deal of fibrous tissue in their leaf-stalks; the most noticeable in this case being M. textilis, which is largely planted in the East and West Indies, Malayan and Philippine Islands. The fiber is known as Manilla hemp. The finer material is used in the manufacture of shawls and other fabrics, and the rougher for ship-cordage; it is also used in paper-making. Banana plants are likewise used for other domestic purposes: the young leaves as culinary vegetables, the mature ones for thatching huts, and mats are made of leaf-strips.

MUSA ENSETE.] Flower.

The common banana grows from 10 to 20 feet high, the Chinese from 5 to 7 feet, but the Abyssinian, M. ensete [see cut of fruit, flower and seed], attains a hight of 30 or more feet. This latter is a noble-looking plant, with very stout "stem," and vast obliquely-erect leaves that have a deep red mid-rib. In fact, this Abyssinian banana produces the largest entire leaf of any known plant whatever. A few years ago an extremely fine specimen grew in the palm-house at Kew; I measured the blade of one of its leaves and found it to contain 89 square feet. This species is often met with in greenhouses. Its fruit is useless as food, but the base of the flower-stalk is cooked and used as a vegetable. This species never produces suckers, and must, therefore, be raised from seed. The Kew specimen referred to, kept on blooming for fifteen months. Banana plants are much cultivated for ornament in greenhouses. Though the commoner kinds are frequently met with, we have sorts particularly adapted for this purpose. They include: M. S. vittata, a variety whose leaves are variegated with large white blotches and streaks; M. zebrina, whose leaves are deep green spotted with crimson above, and crimson shaded underneath; the Chinese banana, whose leaves are in a rosette-like tuft at the top of its short "stem;" M. superba, in appearance just intermediate between the Chinese and Abyssinian bananas; the Abyssinian banana so long as it can be kept in a small state, and this is done by root confinement. Moreover, we winter this species successfully in the cellar. And there are a few kinds highly ornamental on account of their brilliant red flowers (bracts), notably M. coccinia, which does best planted out in a conservatory. It only grows some 6 to 8 feet high.

In some European gardens the Chinese banana is grown in glass-houses, for its fruit alone, and that most successfully, too; bunches weighing from 40 to 70 pounds being produced. A soil of turfy loam and old manure is used, a high temperature is employed, and lots of moisture at the root, overhead and in the atmosphere given. This species often fruits in the greenhouses without any special care, but then we cannot expect such excellent results as we would did we treat for fruit only. A nice bunch ripened here last fall.

Banana plants may be introduced to the summer flower-garden with excellent effect, grouped with other sub-tropical plants in beds or borders, or, better still, isolated in sheltered nooks. They may be planted out, or if preferred, kept in pots and the pots plunged out of sight. But in all cases they want sheltered positions, otherwise their leaves will be torn to shreds by the winds. They should never suffer for the want of water, and liquid manure is highly appreciated.

Cambridge Bot. Garden.

[In addition to the above we need add, at this time, only a few remarks. The cuts are after

MUSA ENSETE. Transverse section of seed.

MUSA ENSETE. Seed seen from below.

Le Maout, Decaisne and Hooker, and represent parts of the Musa Sinensis and Musa ensete. Respecting the cultivation of the banana, as adapted to our Southern States, we hope to furnish notes at a future day. Under favorable conditions a banana plant (varieties of Musa sapientum) will produce, on an average, in one year, three bunches of fruit, each weighing 44 pounds; these would yield for every three acres, in hot climates, 404,800 pounds of bananas, and in countries on the limits of its culture, 140,800 pounds.

As an ornamental plant we wish the banana was better known. All of the varieties are desirable for the conservatory, but M. ensete is in every way desirable as an out-door plant as well. In the house, besides presenting one of the noblest types of vegetation, it stands the dust and heat just as well as scores of quite inferior plants which are prized only for their large leaves. Out of doors, we have found that the leaves of this species are less torn than those of the others, and a single specimen placed last summer in a position exposed to the north and west winds, was the admiration of those who saw it.—EDS.]

BANANA—MUSA SINENSIS.

Industrial Implements.

A SELF-BINDING HARVESTER.

WE refer to WALTER A. WOOD'S Self-Binding Harvester. The central-western part of the United States is noted for the immense area in grain. Farms embracing thousands of acres are sown to wheat, rye, barley, etc., and in the harvesting season it becomes a serious problem to gather the product without loss of time, tantamount to loss of grain. Farm labor is often difficult to get, and untrustworthy when secured.

This fact has spurred invention to create the self-binder — for years the dream of practical men. The firm owning the patents covering the binder in question, had expended, it is said, upwards of one hundred thousand dollars in experimenting before one was produced that was considered as fully up to the standard required by the exacting ideal of the inventor.

Such an expenditure on a problem whose successful solution was by no means a foregone conclusion, was extraordinary.

Although the binder had been in use to a limited extent previously to the Centennial, it was not until the Field Trials, held under the auspices of the Commission, that it came prominently into notice. Mr. JOHN COLEMAN, English Commissioner, in his report to the Royal Agricultural Society, says:

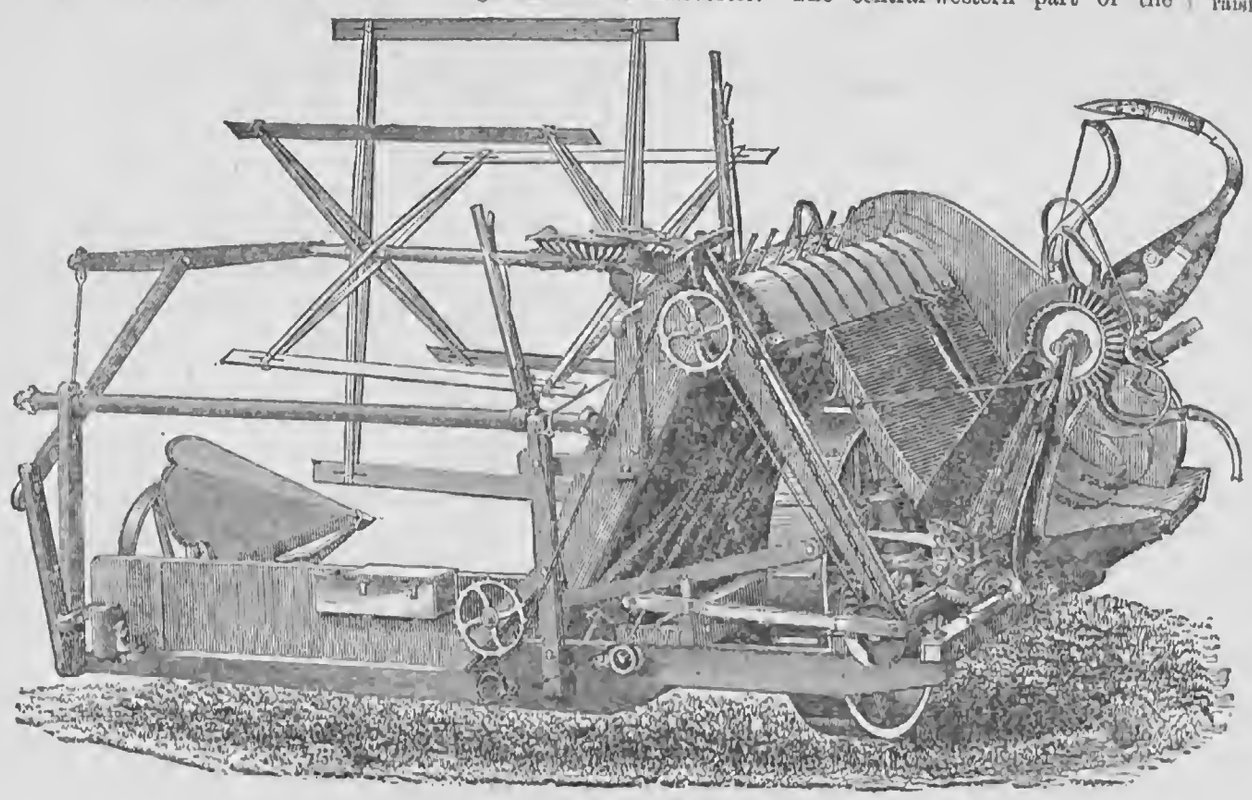
"The great feature of this department, and in fact of the whole Agricultural Exhibition, was the automatic binder, the realization of a long-cherished notion on which mechanics have been engaged for years."

It was the good fortune of American inventive genius to have its triumph accentuated at our Centenary, creating a new era in mechanics applied to agriculture, as did the American reaper at the London Exhibition in 1851.

It is seldom that a new thing so rapidly overcomes conservative prejudice as has the WALTER A. WOOD Binder. Mr. OLIVER DALRYMPLE, a gentleman who in 1877 had 7,500 acres in grain, and who this season increasing his acreage, will use seventy-six self-binding harvesters, writes to Mr. W. A. Wood, under date August 20, 1877, as follows:

"Justice requires that the wheat-growers of the West should express to you the gratitude I have no doubt they share with me, for the enterprise and perseverance you have manifested in bringing out a Self-Binding Harvesting Machine that may be depended on. I used ten of your Binders last season, harvesting 1,280 acres with them, and this year I bought thirty-one more, and have with the forty-one Binders, harvested about 7,500 acres of good heavy grain, and have done it in good season, so that none has been over-ripe or wasted. I have never seen so excellent binding or so clean work as these Binders do; there is literally nothing lost. The grain saved over hand-binding more than pays the cost of wire.

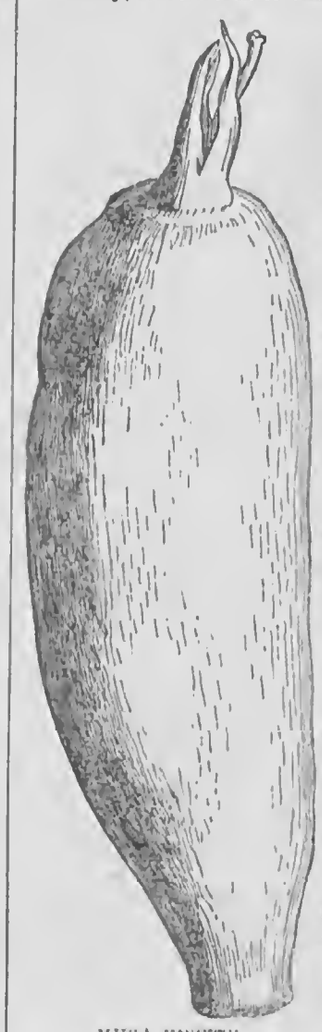
"You have taken a great burden from our shoulders, as the expense and vexations attending a large harvest were so great that many were deterred from grain-raising."



THE WALTER A. WOOD SELF-BINDING HARVESTER.

This is not only highly complimentary to the binder, but also a notable instance of the grand scale on which individual farming enterprise is conducted. The illustration in this issue is as good a representation of the Binder as can be shown when attached to the Harvester. Although its mechanism is very simple, it is somewhat difficult to describe. The grain follows the usual course over the Harvester, and is delivered in a continuous stream on the concave shown at the right. The revolving binder-arm, separates from the stream of grain passing into the concave an amount sufficient for a gavel, and by the aid of the compressing and reciprocating arms compresses the gavel in a compact form and while it is so compressed, passes the wire around it, binds it, and with only one movement, makes the twist and severs the wire from the band, leaving the ends protected so that they may not cause inconvenience to those who handle the bundle. The sheaf is then thrown from the platform automatically by means of the compressing arm, while a new bundle is in course of binding. The operation of the machinery is slow, and uniform, with a minimum of friction.

The whole machine is at all times under the control of the driver, who by convenient levers may enlarge, or reduce size of bundle, stop the Binder in its work, or move it laterally, to conform to the length of straw. Left to itself the Binder works automatically, making a bundle every ten feet.



MUSA ENSETE. Fruit.

The Walter A. Wood Harvester to which the Binder is attached, is too well known to require any but the briefest mention. The Binder is in no small degree indebted to the Harvester for its efficient results in lodged and tangled grain, owing to the Harvester being adjusted to adapt its cut according to the condition of the crop.

In theory the use of wire has met with opposition, but practice proves its value. Again quoting Mr. COLEMAN, he says: "I am aware that a strong prejudice exists against it, which I admit to have shared in previous to personal experience; but which is now entirely removed from my mind. The objections are that however carefully handled, portions will pass through the thresher cutting up like chaff. The wire can be prevented from entering the thresher at all by the use of a pair of forceps, which, while they cut the wire, retain it in their clasp. The man who attends to the feeder has this work to do. The wire cannot be used again, but its sale would pay for a good deal of the cost."

We have noted the performances of this Binder as closely as opportunity permitted from the date of its appearance at the Field Trials, feeling the importance of the interests involved in the successful working of such mechanism.

A word in regard to the remarkable factory where they are made will not be without interest, as its extent and the magnitude of its operations are quite as conspicuous in their way as is the Binder itself.

The Walter A. Wood Mowing and Reaping Machine Co. has established at Hoosick Falls, N. Y., U. S. A., probably the most extensive works in the world for the manufacture of agricultural machinery, having made and sold up to the beginning of this year, 277,027 machines. They employ two gangs of 1,000 men who work night and day alternately, the product of whose work is some twenty-five thousand machines yearly, distributed about as follows: Ten thousand mowers, nine thousand reapers, and six thousand self-binders. This immense product is for the domestic and foreign trade; about one-third going abroad. This year a new sweep-rake reaper and an improved light mower are the novelties. But to a visitor everything is novel. Where one hundred and twenty-five finished machines are made, daily it seems, on walking through the shops, that they positively grow before the visitor's eyes. Mr. WOOD, the president of the

company, has been the recipient of orders of distinction by the Emperor of Austria; and the Wood Machines have received so many medals from all countries as to have earned a cosmopolitan reputation which their merit retains for them.

DIAGRAM OF THE BUFFALO PITTS THRESHER.

THE accompanying diagram of the Buffalo Pitts Thresher, made by Pitts Agl. Works at Buffalo, N. Y., will give a clear idea of the mechanism of this well-known machine, and its mode of operation.

A is the feed-board on which the grain is spread and passed to the cylinder, *B*. *B* is the threshing cylinder with iron spikes or teeth *a*, fixed at certain distances from each other throughout its length and circumference. *C* is the concave, also having iron spikes or teeth *a* set in it.

The concave is fixed; the cylinder revolves rapidly on its shaft. As the grain is fed into the cylinder, the cylinder teeth catch it and drag it at great speed between the rows of concave teeth,—literally combing the grain out of the straw.

D is the grain belt,—an endless belt of stout duck on which are nailed wooden buckets or cells *b*. This grain belt runs on the rolls, *c*, and over the pulleys, *d d*, and receives from the cylinder the straw and threshed grain and carries it away,—the straw riding on top and the grain dropping into the cells.

The rolls, *c* are hexagonal (not circular as erroneously shown in drawing) and thus constantly agitate the belt and promote the separation of grain from the straw.

E is the beater—four wings, with iron fingers *e*, revolving on a shaft. These wings constantly beat the straw as it passes under them and thus further assist to dislodge any loose grain from the straw. *F* is the picker.

G is the straw belt — an endless belt — made of slats of wood nailed, at short distances from each other, to two leather belts, forming an endless ladder. This belt runs over the pulleys *f f*.

H is the agitator—a bar rocking on its center—so that the ends *h h* alternately strike the belt and shake the straw *I* is a tight floor. *K* is a wire riddle (or sieve) in the shoe. *N* size of mesh varies according to the kind of grain to be threshed. *M* is an opening for discharge of straw.

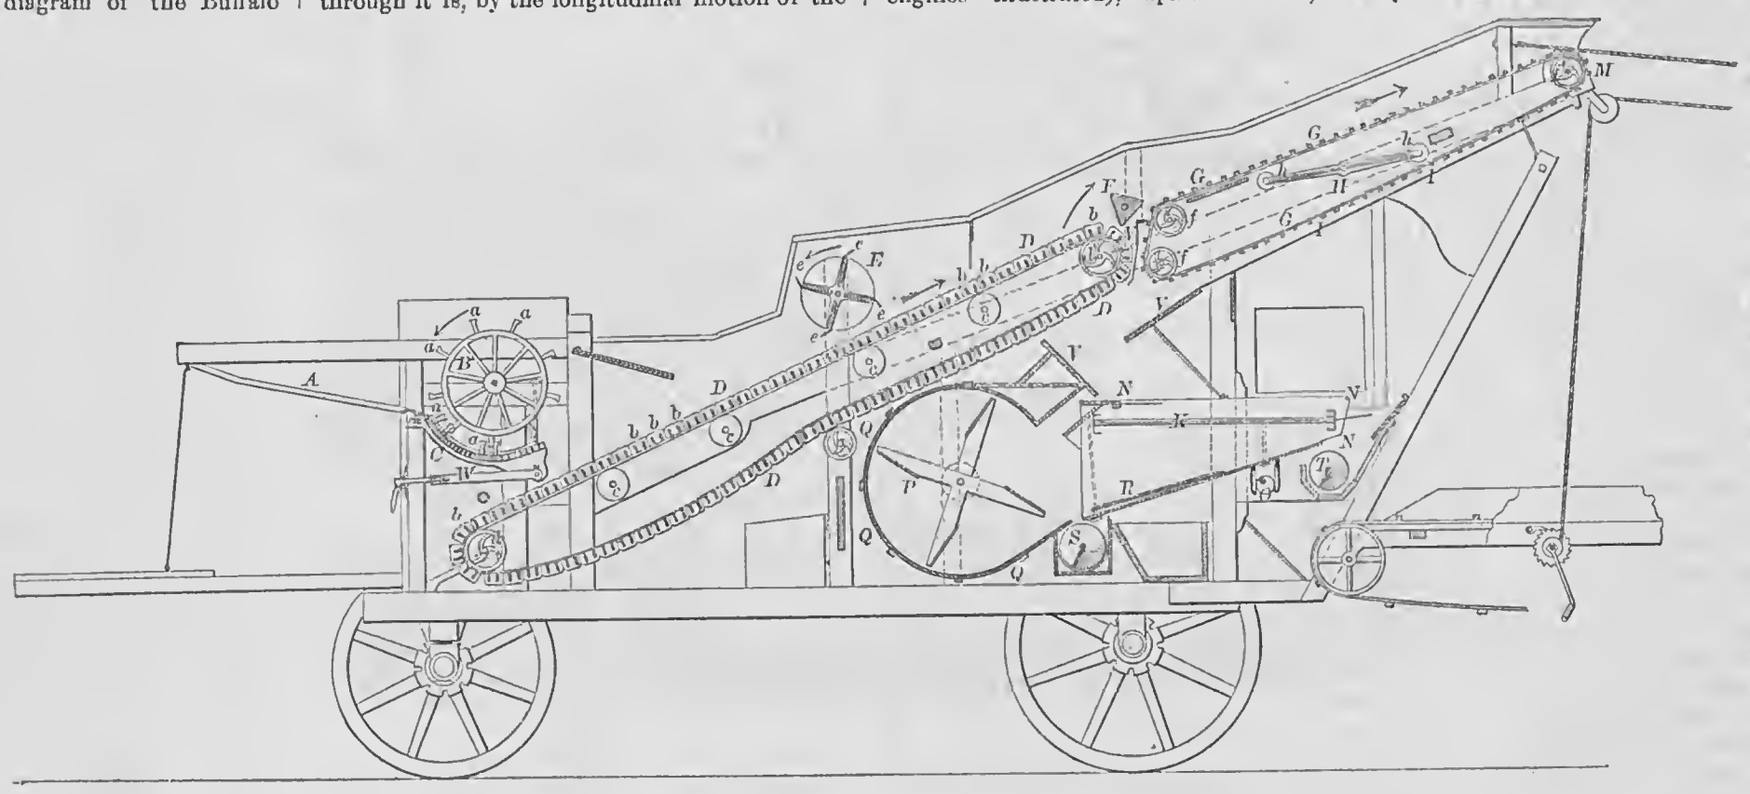
As the grain belt *D* turns over the pulley *d*, the threshed grain drops out of the cells *b* on to the riddle *K*. At the same time the picker *F* tosses the straw over to the straw belt *G*, and by this the straw is carried to the aperture *M*, and discharged.

The ends *h* of the agitator *H* striking the straw belt cause any grain still lodged in the straw to drop between the slats on the floor *I*, and by the returning (under) side of the belt this grain is swept on to the riddle *K*

N is the shoe, having longitudinal motion. *O* is an eccentric, giving motion to the shoe. *P* is the fan. *Q* is the drum enclosing it. *R* is a fine sieve forming part of the bottom of the shoe. *S* is the grain conveyor—a screw working in a trough. *T* is the tailings conveyor—similar to grain conveyor. *V* boards guiding the grain in its fall on to the sieve *K*. *W*, concave raiser to regulate distance between cylinder and concave. As the grain falls from the grain belt cells *b*, and from the floors *I*, toward the sieve, *K*, the blast from the fan, *P*, blows the chaff over the end of the shoe, *N*. The grain is sifted through the riddle *K* on to the shoe floor (which is sharply inclined) and rolls into the conveyer *S* by which it is delivered to the receptacle at side of machine—perfectly clean.

Any fine seeds which pass through the riddle *K* with the grain, fall through the fine screen *R* into the box beneath.

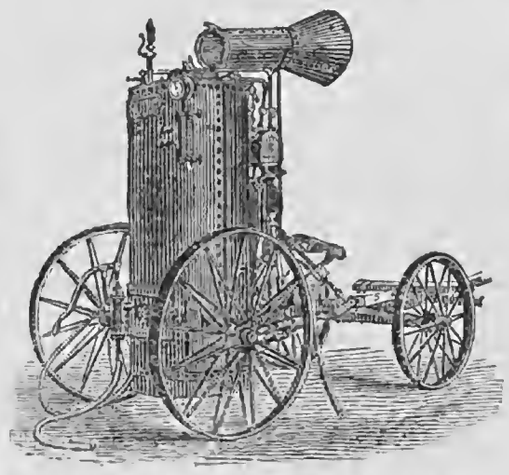
Whatever falls on the riddle and does not sift through it is, by the longitudinal motion of the shoe, assisted by the blast, carried into the tailings conveyer *T*, and thence is carried to the cylinder to be re-threshed.



BUFFALO PITTS THRESHER—DIAGRAM.

AMERICAN FARM ENGINES.

THE use of steam engines for farm purposes is of quite recent date in the United States, but



THE "BOSS CLIPPER" VERTICAL ENGINE

so rapidly are they growing in favor that a number of large manufacturing concerns find this special industry a lucrative business. The competition has led to ceaseless efforts in the production of an engine that shall be best adapted to farmers' use, and, in pursuance of our custom, we give illustrations in this issue of two classes of engines, the horizontal and vertical, that are made by the Taylor Manufacturing Co., of Westminster, Md., that possess admirable features. The facilities of this Company for producing high-class work are ample, and embrace not only the farm engines under notice, but stationary and portable engines of most of the approved designs, including the Corliss model. In the material used throughout the work considerations of price are subordinated to quality. The castings are made of charcoal iron, and the minor parts, such as pumps, governors and safety-valves (of which there are two on each of the engines illustrated), spark-arresters, safety-plugs, etc., are finished thoroughly, and combine some of the latest improvements.

The novel features of the horizontal engine are, the manner of staying the crown sheet, and the device for supplying dry steam to the cylinder. Trusses of wrought angle iron extending the whole width of the crown sheet, with the ends turned down and resting on the edges of the side sheets of the fire box, and placed four inches apart the whole length, are additionally strengthened by two braces fastened from the outside shell of the boiler to each truss. The "throat," or connecting sheet of the boiler, is also fastened by a double row of rivets. The stay bolts in the sides of the fire box are close together, and washers placed between the trusses and the crown sheet, leave space for the circulation of the water and prevent sediment collecting.

The cylinder is worked inside the cast iron steam dome, and is constantly surrounded with steam of the same temperature as that generated in the boiler. This arrangement obviates condensation, and secures a strong, elastic force. This feature constitutes the dry steam patent.

In the vertical engine, the flues of the boiler are always below the water line, and by the shape of the dome and fire box, which are narrow at the top and wide at the base, a direct heating surface is attained. It is claimed that this arrangement prevents the flues from being injured by fire; that the cast iron of which the dome and smoke box are made receives a direct heat from the fire box, the steam is super-heated, thus decreasing the expenditure of fuel; that the engines can be put to hard labor without lifting, or causing the water to foam; that steam is generated more rapidly, and that the flues can be quickly repaired at will without damage to fire box or boiler.

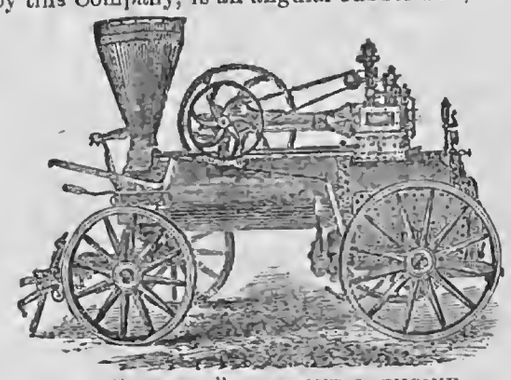
The engine works in a solid cast frame of the Corliss pattern, and the manner of mounting combines rigidity and simplicity, as will be seen by a reference to the cut.

In the horizontal, the engine is so placed as to avoid strain, and the cylinder being inside the dome, the pressure on the piston, it is said, is uniform with that shown on the steam-gauge.

Economy in water and fuel, good wearing qualities, and careful workmanship, commend these engines for all purposes for which they are adapted.

The handsome catalogue of the Company, giving illustrated descriptions, prices of repairs and the most minute particulars, may be obtained free, by addressing the Company, or through their representative at Paris, where the Company has a full exhibit in the Agricultural Department, G—1. U. S. Section, comprising one 10-h. power Dry Steam Engine on Wheels, one 10-h. p. "Clipper" Vertical, and one 20-h. p. "Utica" Portable Engine, which drives the shafting in the Agricultural Department of our section.

A new feature in belting, controlled exclusively by this Company, is an angular rubber belt, run-



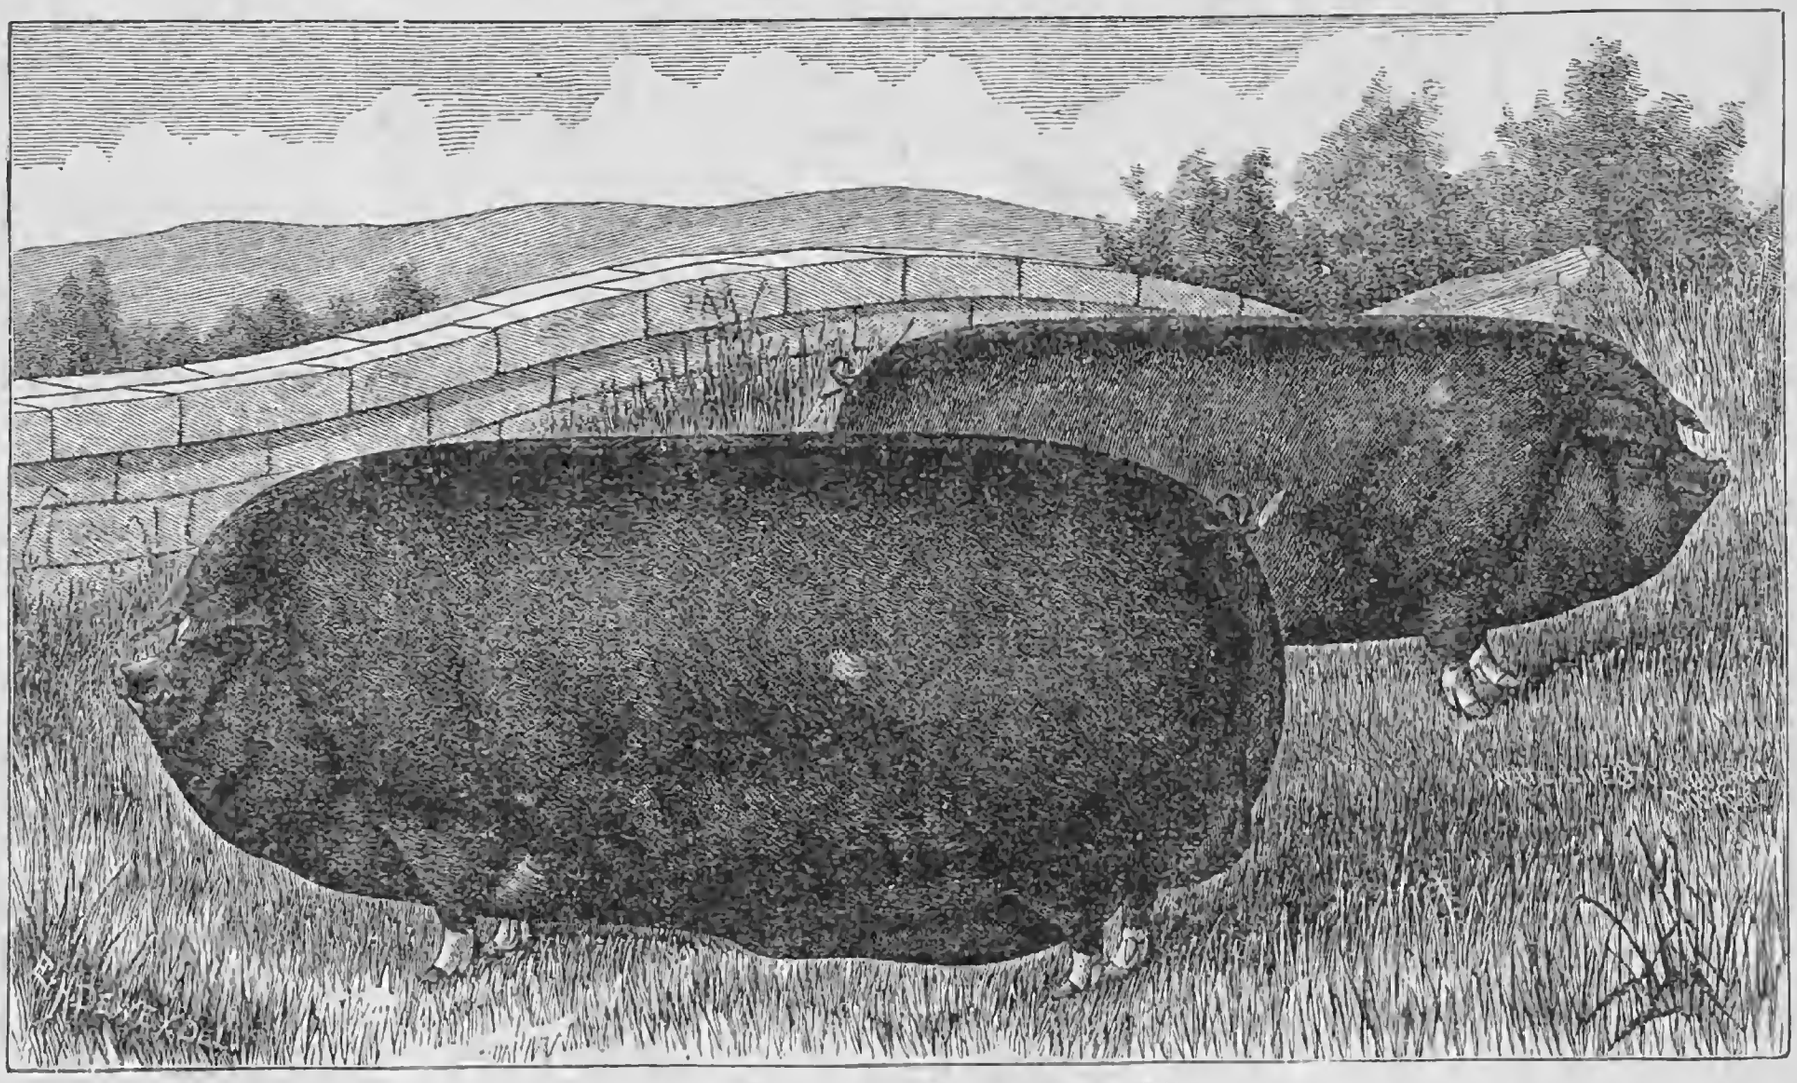
THE "CLIMAX" HORIZONTAL ENGINE.

ning in grooved wheels, which obviates all leveling and preparatory work commonly so troublesome in setting engines for service.

The Swine-Herd.

POLAND CHINAS.

THIS breed of swine variously known as Magie, Poland-China and Butler Co., was originated by Mr. D. M. MAGIE, the present manager of the D. M. MAGIE Co., Oxford, Ohio, and is the outcome of four distinct breeds, the Poland Big China, Irish Grazier and Byfield. Their chief excellencies consist in their susceptibility of being well fattened at any age; large growth when desirable, and the great amount of flesh laid on in proportion to the food consumed. They sometimes dress 350 pounds when no older than ten or twelve months. The illustration conveys a just idea of these swine. They have long bodies, short legs, broad, straight backs, and deep sides with square heavy hams and shoulders. They are large, dark in color, and the ears project over the eyes.



MAGIE OR POLAND CHINA HOGS.

Mr. MAGIE commenced his experiments in 1837, and for thirty-five years the Poland-Chinas have been a distinct breed, and one of the most popular in the States devoted to pork producing as a leading industry.

These animals have of late attracted the attention of foreign breeders, and Mr. J. MUSSON

of "Holt House," Whiston near Proscott, England, writes that the three head sent him by the MAGIE Co. give "unqualified satisfaction, and I must express my thanks to yon for sending mo such fine stock. I think no ono has any better Berkshires, Large Yorkshires and Middle Windsor breeds, than I have, but my honest opinion is that the three head you have sent me are the three best pigs in England at this moment, and if they come up to what I expect, I shall not feel inclined to breed anything else." This must be very gratifying to the Company, and is certainly flattering to Americans.

IN the United States, the Buffalo Starch Works have a brilliant reputation for the excellence of their product. What is known as the "patent gloss" starch is pure, strong and durable. The corn starch, made from maize, is used exclusively for culinary purposes, and is wholesome in a marked degree, as well as being pleasing to the palate. In the United States "corn" starch is a successful rival of arrowroot, and it is only a question of trial before attaining the same result in other parts of the world.

Dairy Husbandry.

THE TRUTH ABOUT IT.

[UNDER this heading, a number of articles have been prepared by able writers. These will appear from time to time. Their object is not at all to deal with "humbugs"—but with the many unconscious errors that creep into the methods of daily country routine life.—EDS.]

DAIRYING FALLACIES.

T. H. HOSKINS, M. D.

THERE have been great advances in the study of the scientifics of dairying, during the last ten years. Large credit is due to a number of enterprising men, who have devoted both money and time to the investigation of milk and its products, and also to improving the methods of breeding, feeding, and handling dairy stock. If I were disposed to criticise anything these investigators have done, it would be the haste some of them have shown to become instructors before acquiring a mastery of their subject. To this we owe much building with "untempered mortar" that has not endured; and, worse than that, the diffusion of erroneous notions among the people, harder to be overcome than a simple, teachable ignorance.

Anxious to avoid the fault myself, and yet desirous to point out what I am thoroughly convinced are serious errors, I shall touch briefly in this article upon some important practical points which have been mis-stated and misunderstood, and about which the popular mind is yet adrift. I do this with some reserve, and only after more than fifteen years of practical study, joined to careful closet investigation of both the chemical and physical sides of the question. The public are often at a loss to decide, where "doctors" and "professors" disagree; yet I believe that I shall make the points I touch upon sufficiently plain, and shall support my statements with such good reasons, that most intelligent and well-experienced practical dairymen will agree with my conclusions.

AIR IN CREAM.

For some time it was thought (and churns to carry out the principle were introduced) that the passage of air into the cream during the process of churning, promoted the separation of the butter. This idea is now exploded, and the churns are found only in garrets. I allude to it merely to show, in the light of what will be hereafter stated, how far away from any true conception of the facts the minds of many must have been when such a theory could have had currency.

WITCHES IN THE CREAM.

Not unfrequently the correspondence columns of agricultural journals contain queries headed, "Why Don't the Butter Come?" or something equivalent, in which the writer details the painful efforts of hours, and even days, over a refractory churnful of cream. Most inexperienced persons meet with this trouble; and not a few, also, who have made a good deal of butter, and made it well, when all natural conditions were favorable. The idea expressed by some that the cream was "bewitched," is the last resort, the world over, for the explanation of uncomprehended natural phenomena. It is only in the clear white light of science (knowledge) that the witch becomes totally invisible. She and the ghost are always best seen in the dark.

TEMPERATURE IN SETTING.

As lately as seven or eight years ago, it was the universal teaching that the proper temperature for setting milk was in the vicinity of 60°. The best authorities agreed that at a higher temperature the milk would become sour before all the cream would come to the surface, while at a lower temperature it would never rise at all. When the Swedish method of setting in ice-water was first reported in America, it could hardly obtain serious notice, so contrary was it to received notions. Now, it has been abundantly demonstrated that cream swims to the surface soonest in milk cooled nearly to its point of greatest density, or about 40°. This is, in itself, a great advance,—probably the greatest single step that has been made in butter-dairying. Yet it was not made by a Professor, but was blundered upon in practice.

THE "CURRENT" THEORY.

Some minds have a great fondness for mystifying plain matters. If one should see a quantity of apples going over a waterfall, it would never occur to him that when these apples reached the still water below it would be necessary to "create currents" in the pool before the fruit would float to the surface. The fact that apples are lighter than water would be considered a sufficient reason why they should float upon it; and as it is a rule alike of philosophy and common sense that when we have a perfectly satisfactory reason for any occurrence, it is folly to seek for any other, we should never think of a "current" theory. Having ocular evidence that a current submerged the apples, and that they came to the surface where the current abated, we should be satisfied. Now, the butter globule, though it is too small to be seen by the naked eye, is to the milk in which it swims what the apples in the case supposed were to the water. If we keep the milk in a state of agitation they do not rise: if the milk is at rest, and just in proportion as that rest is perfect, they swim to the top. The most rapid separation of cream takes place in that apparatus where the milk is quickest reduced to the proper temperature and most rigidly held there. Whenever you hear one of these "current" theorists holding forth, you will always find that he has a "new patent setting-can" in the ante-room, which he would like to show you. Remember the air-churns, and eschew him.

THE ANIMAL ODOR.

That the best butter is now made from cream raised in closed, and even in submerged cans, is what the boys call "a sticker" to those gentlemen who have long and learnedly held forth upon the pernicious "animal odor" in milk, which required the most careful ventilation to be rid of, and which absolutely ruined the flavor and keeping quality of the butter when retained. Various ingenious ways of getting around the stubborn fact are resorted to. It is hard indeed, after having explained how this "odor" originates, what its chemical formula probably is, and how it looks or would look when isolated, to find it disappear, all at once, like a will-o'-the-wisp. No doubt there are "stinks" in milk, but no doubt, also, they are got there from filthy bags and teats, filthy hands, foul air, and the like. Pure healthy milk has nothing in it that needs to be removed by ventilation. Ventilate your cow stables, keep your cows clean, give them good food and pure water, keep yourself and your surroundings clean while handling the product, from the udder to the butter-tub, and you will never be troubled with the "animal odor." Another ghost has been laid, another "witch" has disappeared.

WASHING BUTTER.

Abundant experiment has shown that the natural flavor of butter cannot be removed by washing it with pure water. Careful manipulation, with the cream and everything else just right, will make good butter without washing. But the extra trouble is wasted.

THE "GRAIN" OF BUTTER.

When the butter has "come," and appears in little irregular masses, from a pin's head to a large pea in size, is the time to draw off the buttermilk and wash the butter in the churn. This removes most of the buttermilk. After being then gathered and removed from the churn, worked, washed and salted on the butter-worker at the proper temperature, we find upon breaking it, that it has a granular look. The mass seems to be made of little particles with a slightly glistening appearance. This is called the "grain." These small particles are partially kept apart by films of water, (after salting, this water becomes brine), and the peculiar texture thus imparted to the butter is a test of proper manufacture. Over-churn or over-work it, churn or work it at the wrong temperature, and the grain is gone, never to be restored; and with it is gone a large percentage of the selling value of the butter. Enough water (brine) must be retained to produce this appearance, which distinguishes "butter" from "grease." Consequently the most perfect grain is obtained by washing in the churn before the butter is "gathered."

THE BUTTER GLOBULE.

To those who know nothing of the microscope and its revelations, a world remains hidden of which they can have little comprehension. To the naked eye milk appears a smooth, uniform fluid. To the eye aided by the combination of magnifying glasses, called a "microscope," (seer of little things), it is a translucent fluid, in which floats a multitude of shining globes, and these globes are butter in its primitive state. We do not *make* butter when we churn, although we say so. When the process of churning has been continued until we can see little particles of butter in the cream, we say "the butter has come," and the next proceeding (after washing) is to "gather it." But, in reality, churning is a single process. There is no difference between the "coming" and the "gathering," except that the latter is visible, while the former is invisible to the unaided sight. All that we do when we agitate cream in a churn is to throw the butter globules strongly against each other. If the cream is too cold, we may do this forever and produce no butter, for the same reason that we cannot work butter into rolls, or prints, when it is too cold. The globules are too hard to stick together. They merely rattle against one another in the churn, like peas in a bag. If the cream is too warm, we can churn them together and then churn them apart again, because they are in too fluid a state to hold together against the action of the churn. So no butter comes in either case—there are "witches in the cream." The true exorcist, in such trouble, is a thermometer.

MORE MYSTIFICATION.

The mystifiers have held high carnival over the butter globule. Nearly all of them (I do not know an exception among dairy "professors") declare that it has a shell, or envelope of membrane. Having created this shell, (as the German philosopher created an elephant, "out of the depths of his moral consciousness"), they have as much trouble with it as they had with the "animal odor." Some tell us that the cream must be kept until acidity is developed, in order to weaken the shell. One has said that the churn must be so constructed as to have a grinding action upon the cream, for the same purpose. A good many have seen the shell, not only upon the globule, but after it has been ruptured and the butter has escaped. They describe it as accurately as they described the "animal odor" when concentrated into a "yellow oil," or as the old lady described the egg which the doctor made her throw up with a dose of lobelia. She said it "looked for all the world like the yelk of an egg."

And yet we know that we can make butter as easily from sweet cream as from sour. We know that we can make butter as quickly by shaking cream in a plain pine box as when agitated with the most scientific dasher ever invented. We know that at the right temperature we cannot carry a bottle of cream a few miles in a wagon-box without finding butter there at the end of our journey. So far, we have common sense *versus* inaccurate science.

If we go further, we shall find that while 20 years ago all physiologists thought they could see a membrane on the little globule (and nothing is more easy than to deceive one's self on this point in using an imperfect instrument, or a good one unskillfully,)—now, more than half of those who have studied the question with ability, declare it to be naked. It is really a difficult question to decide. Both optically, with the microscope, and by the use of chemical tests, the highest manual skill and the best mental ability are requisite in the determination of this apparently simple problem. But the writer hopes he may say, without undue egotism, that though "only an ordinary M. D. and farmer," he fifteen years ago, and several times since, has repeated, with many variations, a great variety of tests, both on the optical and chemical side of this "membrane" question, and concluded each time with a firmer conviction that the butter globules swim "bare naked" in the serum of the milk, requiring forcible contact only, at the right temperature, to cause them to adhere to each other and form butter. When he began this study, he was not aware that a single prominent sciontist held any other view than that the butter globule had an envelope. Now, he is happy in finding the majority upon his side; and he looks, in a few years, to see the point demonstrated, by some ingenious experiment, so that there can be no longer any dispute. Practically, it is already proved, since the practice of the dairy would not be at all modified by the demonstration referred to. Its operations are conducted exactly as though no envelope exists, and with perfect results.

Entomological.

REMEDIES FOR THE CODLING-MOTH.

PROFESSOR W. J. BEAL.

NOTWITHSTANDING large numbers of good observers have devoted much time in trying to discover some excellent remedy for this insect, it still remains the leading pest of the orchard. In case of other insects, parasites have come sooner or later, and have aided in keeping them within reasonable bounds. The codling-moth still thrives with remarkable vigor.

It ought to be generally understood by this time, that there are two broods of the codling-moth each year, one living over winter to work on the early apples, the other brood coming from the first brood during summer, to lay the eggs for destroying our late and winter fruit. In winter the moths are in the worm-state, under rough bark of the tree, about old stumps and rails and logs, and between boards and fence posts. Some winter about sheds where fruit was stored in autumn; others are in cellars, about beams and barrels; many are shipped to market with the fruit. The windows of cellars should be covered by screens on the approach of mild weather, to prevent the escape of the winged insect to the orchard.

All remedies may be divided into two classes. First, those which kill the insects in some form or other; second, those which drive or keep the moths from the fruit.

The use of swine in the orchard is one of the oldest and easiest to apply. It is of more or less value, and often attended with some inconvenience. Hogs sometimes strip the bark from the trees, and usually pull down and destroy the lower limbs. Unless they have rings in their noses, more or less rooting is done at irregular intervals. Swine are only a partial remedy at best, as the writer first showed in 1874. He has several times since made similar experiments at Lansing, Michigan, with similar results. Late in July, 250 apparently wormy apples were picked from the ground and cut open. *Not one* contained a worm. From some experiments, I think a worm will not remain in an apple one night after it falls. Swine must be smart and ever ready for each apple when it falls. Of 250 apparently wormy apples taken from trees at the same time, about 25 per cent. only contained larvæ; the larvæ had crawled out of 75 per cent. of the apples. Even the smartest of swine would not catch three-fourths, unless the swine were unusually enterprising and climbed the trees for the fruit

On July 7th, 101 apparently wormy apples were taken from one Wagener tree. Fifty contained the worm, fifty-one had lost them. On July 26th, 200 Red Astrachans were apparently wormy, and picked and cut open. Ninety-nine were found to contain worms; 101 no worms. How many of these would lose its worm before falling to the ground is uncertain. Most likely, some of them. It is barely possible that the odor of swine or sheep is offensive to the moths.

Writers in several of our leading agricultural papers have this spring stated that swine would exterminate the moths, or keep them from doing much harm, if people would only make a liberal use of them. Sheep are equally recommended by some writers.

Numerous kinds of bands have been used about the trunks of trees. Under the bands the the worms secrete themselves. By numerous experiments made by many persons, it has been shown that the worms crawl up as well as down the tree to find a good place for concealment. The bands need to be applied as soon as the earliest worms become nearly full grown in the earliest apples. The bands should be changed every nine days especially in warm weather, until the 25th of August. This is not very laborious or troublesome, although some writers have tried to carry that idea. I have found on an orchard of 250 trees that this care and expense of material for the whole season need not cost over four cents to each tree. As I once said, the man who has not enterprise enough about him to take this trouble to save his fruit, deserves to eat wormy apples, and sell them at second or third-class prices.

Various materials have been used for the bands about the trees, such as straw, thin strips of wood, old rags, paper, &c. If more than one thickness of paper is used, care must be taken to kill the moths between the folds, where a part of them hide. Mr. Greenman, of Niagara County, N. Y., has lately got a patent out on a paper band, lined with cotton flannel. I have purchased a few of them, and intend to test them carefully with bands of fuzzy, coarse cloth. I shall place two bands on several trees, in some cases placing Greenman's bands above, and in other cases placing them below the cloth bands. There is no patent on the linty cloth which I anticipate will do quite as well and cost less than the patent article.

Some are claiming to catch the moths in the winged state with vinegar and water in open dishes, or by a light over a tub of water in the night, or by molasses on boards or paper. Let everyone experiment on every thing he can think of; but he should be sure that he is not mistaken in the game he catches. If an attempt is made to kill the insect, it should be a united attempt—whole neighborhoods, especially those separated from others by strips of wood or large open spaces without apple trees. We know of several communities who are working together this summer.

It is generally advised to employ a remedy that shall kill the moths; but if one is inclined to be selfish, or wants to get the rewards of his own labor regardless of others, he will be likely to try a remedy which drives the winged insect from his trees.

The late Dr. Hull, of Illinois, several years ago, found that slacked lime thrown all over the tree when wet, would prevent the apples from injury. Others have since tried the remedy with success. Another man, after trying it, believes that gypsum, or land plaster, answers the same purpose. Another has tried two ounces of aqua ammonia to a pail of water, which he throws with a pump all over the tree just at evening, once a week after the middle of June. He thinks that he knows that it saved most of his apples where it was tried last year. I am trying most of these remedies this year, and some besides. I am using carbolic acid in water, which is thrown over the trees; also gas lime placed in open dishes, or on boards on the tree.

Everywhere.

NOTES FROM THE RURAL GROUNDS.

DWARF PEARS.

Much difference of opinion exists as to the relative length of life as between Standard and Dwarf Pears. Some think, if well attended to, dwarfs will live as long as standards—others, that they are too short-lived to be worth cultivation at all. We began pear culture with a leaning towards the latter belief, but experience has taught us that the truth lies between the two. If now we were obliged to give up the one or the other for home culture, it would be the standard, for this reason if for no other: One must wait, under the most favorable circumstances, at least six years for it to fruit. If then or before, the trees are destroyed by the diseases which every year seem more numerous and destructive, one is tempted to relinquish pear culture, or, at least, not to replace the destroyed trees rather than again wait so long a time for fruit. The dwarf (many varieties at least,) will bear as much fruit the second year as the average of standards will bear the sixth year. They are no more liable to diseases, and, if well cared for, washed periodically with potash, lime, etc., and not permitted to ruin themselves by overbearing, will live and thrive for ten years at least. To replace a dwarf pear seems, and is, a smaller matter than to replace a standard. The roots of quince do not spread so far—the tree itself never occupies half the space. We may throw out an old dwarf and put in its place a young one, and scarcely know of the change, while the replacement of a standard is felt for several years.

That a Dwarf Pear should be shorter-lived than a Standard is quite in accord with nature. It is the price we pay for obtaining fruit earlier than we would otherwise, and for obtaining a larger quantity in a given space. Do these benefits pay us for the sacrifice? A tree, like an animal, grows on through youth until it reaches puberty—maturity. The vigor which induced the growth of youth ceases not with fruitfulness. With fruitfulness the vigor of the tree finds another way of expending itself. Whereas previously it was all concentrated upon the production of new leaves and shoots, and the enlargement of the older stems, it now finds there is something else to support. The same energy exists, but from now on it must be distributed. Fruit-bearing is the new function of the tree that is passing from youth to age. Its life of indolence and unproductiveness is at an end. It has henceforth to work for its living. As it sprang from good seed—as it was well reared, so it will be vigorous in health and prove fruitful of its kind until the end of its natural existence. Can we preserve these good qualities, and yet, by the skill of man, effect an earlier maturity? Ah, no! What we gain in a forced maturity we lose in an earlier decay. It is adding a slice on here that is cut off there. The most that we can do with Nature is to twist her so that she shall be more responsive to our immediate wants.

Nature has a lenient way of letting wise Man do this—though she warns him of the heaps of trouble he is piling up for himself in the future, or for future generations. When those evils come in the shape of blighted trees, she leaves him to find a remedy. Perhaps what is understood by "a refined civilization" might thence learn the lesson that it is not half what it sets itself up to be, and that it is largely made up of cutting off slices here to add them on there, and by twisting nature to its present needs, regardless of what it all may lead to in distant years to come. Among the necessities of a "refined civilization," we regard the Dwarf Pear as one.

TIME TO TRANSPLANT EVERGREENS.

"We forgot this spring that evergreens must never be transplanted until after the sap is started and is in full flow, if you want them to do well. So, early in the spring before the frost was fairly out of the ground, we transplanted a native Spruce, and now it is dead. It had plenty of roots and they were not frozen, and it was well set."—F. D. Curtis in Agricultural Tribune.

We remember once to have transplanted twelve Hemlocks so early in the spring that all the roots below eighteen inches, were cut off and left in the frozen ground. They were not less than five feet high, and were taken from nursery rows. On another occasion we transplanted Hemlocks during a mild spell in February. Not one of them was injured in the least. On the first occasion we also transplanted Spruce, Balsam, Austrian and Scotch Pine, without injury. Some of the Pines were from seven to eight feet high. We have repeatedly transplanted specimen lots of hardy evergreens, a dozen to fifty of various varieties of the above, and our success has been so unexceptional that we would prefer early spring to any other season. We remember on one occasion that, though the frost was out of the ground, the earth was so saturated that water stood in the holes, and the trees, though small, had to be propped up to prevent them from falling over in the puddle of mud. We have known arbor-vitæ hedge plants, and many other evergreens in large quantities, transplanted in August and all live. In other years we have known nearly all to die. We supposed in the former instance they owed their preservation to a showery August, and in the latter their death to a dry August. If such plants are taken up in summer without balls of earth, and shipped to any distance, the chances are all against success. In early spring, it seems to us there are no chances whatever of failure, if only the roots be kept moist and protected from drying or frosty winds, to which the roots of evergreens, and Hemlocks especially, are very sensitive.

OUR PREPARATION FOR INSECTS.

We have referred more than once, though somewhat indefinitely, to a mixture of coal ashes, &c., which we have been using during this season as a protection against many of our plant pests. Its use has been so effectual with us—it has saved us so much vexation and trouble as compared with other mixtures or measures which we have used or adopted in past seasons, that we urge our readers and friends to give it a trial. First, sift ashes enough through an ordinary ash-sifter to make a bushel of sifted ashes. Next, pass these through a flour-sieve, and *thoroughly* mix therewith one pound of pulverized aloes, one pound of hellebore, and one pound of flour of sulphur. Put the mixture into an open box and place it beside the range until every particle of moisture is dried out of the entire mass. It is now ready to be used; and early in the morning, while the dew is fresh upon the leaves, and there is no air stirring, is the best time to do so. The mixture will now be found so fine, so light and fluffy, that a thimbleful thrown up among the leaves will surprise one with its buoyancy, and the space through which it may be seen to float, and the number of leaves upon which it finally settles. It envelopes every part of the leaf, petiole, twigs and branches like a vapor, and at length, impinges, as it were, upon them as vapor would upon an ice-cold plate of glass. We have tried it upon grape-vines, rose-bushes, various shrubs, vines and fruit trees infested with aphides and slugs. We have dusted it over peas, corn, tomatoes, melons, etc., and the plants so dusted were seldom cut off by the cut-worm. We have dusted it upon two plum trees, as needed, and the plums, save one, are at this time fair and sound. A pint will amply suffice for a tree ten feet in hight, and the topmost leaves may be reached by tossing it up from the hand, or any little handled cup or spoon. A bushel of the mixture will suffice, we think, for our grounds this entire season, though insect pests were never so numerous. Does it kill them? We do not know, and do not much care. We have little faith in the ability of man to exterminate any race of such minute insects, thousands of which are born while he is killing one. To exterminate those upon his own grounds one season is little less than a measure of prevention—they will be just as numerous the next.

It may be said there is nothing new in the above; but we think there is. The novelty consists in the fineness of the preparation, and its being perfectly dry, which render its application far more easy and thorough. Soot, ashes of tobacco, and a dozen other nauseous powders may be added as one may choose, no doubt with good effect. We shall know more about it from further experiment. We have learnt a little of value, and hasten to place that little before our readers.

NOTES.

Among the many new things which we try from season to season, it is seldom we have to report upon one that is really a decided improvement upon old varieties.

In the way of peas, American Wonder is an improvement, in its way, upon anything we have previously tried. The vines grow about fourteen inches high, and are vigorous, strong and prolific. The pods are about the size of Philadelphia, well filled, averaging five seeds, which are very tender and sweet. It ripens with Early Dan O'Rourke, Carter's First Crop, Laxton's Alpha, &c. Until a little later in the season, we come to McLean's Little Gem; we prefer this variety to anything we have yet tested. B. K. Bliss & Sons are the first to send out this pea.

We shall have a few grapes in spite of the frost already often alluded to. It was taken for granted that the fruit buds which were destroyed would not be followed this season by other fruit shoots. Of course, buds which push from the new growth which was only harmed (not killed) by the frost, bear no fruit buds, but those which have since pushed from last year's canes do—and it is from these last we shall have a bunch here and there.

The standard gooseberries (worked on Missouri currant stock) so much talked of for the past two years, are crowded with fruit, and the fruit are crowded with mildew.

ROSES.

Among a lot of beautiful new French Roses, with which we were presented by the firm whose name one of the varieties bears, is "Dingee Conard," thus named by Eugene Verdier of Paris, in honor of the well-known Rose-growers of West Grove, Pa.

The flower is of goodly size, the petals are large and unfold with that sort of airy beauty that gives to a full rose-bud its indescribable charm. The color is a deep scarlet, suffused with a changeable violet-blush, and we could wish, as a result of reading this note, that "Dingee Conard" might find a welcome home in the gardens of our readers.

Bergen Co., N. J.

NOTES FROM THE RURAL FARM.

Queens Co., L. I., June 19.

Beans, melons, etc., were frozen entirely, and the second sowing is just making an appearance.

There are six acres of Clawson Wheat. Heads will average three and a half inches—the straw, five feet. Manured with barn-yard manure only. Last year 400 pounds of bone-dust were drilled in with oats. The year before the field was in corn, manured with barn-yard manure only. There are six acres of corn manured with 1,400 pounds of Mapes' Corn Manure, the plants, four feet apart each way, and four plants to a hill.

Six plots of corn are sown with different manures.

No. 1.—Stable and barn-yard manure in the hill only. The plants average 14 inches in hight at this time.

No. 2.—Mapes' Grass and Grain Spring Top-Dressing. Plants not so tall—leaves not so broad or deeply-green as No. 1.

No. 3.—Bone flour. This plot is doing well, but inferior to No. 1.

No. 4.—Mapes' Complete Manure. This is not so tall or vigorous as either No. 1, 2, or 3.

No. 5.—No manure. This is the poorest.

No. 6.—This looks the best, with the exception of plot No. 1. Mapes' Complete Manure.

All of the above sown May 8.

SPRING WHEAT.

The manure used on all of the following plots was the grain Spring top-dressing above referred to:

Plot No. 1.—Spring Mediterranean. First to head. Heads average four inches.

No. 2.—White Spring Russian, (beardless). Heads average four inches.

No. 3.—China Spring Wheat (bearded). Averages four and a half inches. Resembles Mediterranean in all respects, except it is longer bearded.

No. 4.—Pringle's New Hybrid Spring Wheat Defiance. (B. K. Bliss). This is a curiosity. The stems are the largest we have ever seen—the leaves very broad. It is not so tall as any of the others, except Champlain. Heads will, at this time, average four and a half inches. It would seem impossible for this grain to lodge. Not bearded. Highly vigorous and promising.

No. 5.—Pringle's New Hybrid Spring Wheat Champlain. Leaf not so broad. Straw not so heavy. Not so far advanced as Defiance.

VARIOUS.

We have five acres of timothy and clover which will cut three tons to the acre. Stable and barn-yard manure only. This crop is everywhere heavy in this section of country.

Harlequin potatoes (Bliss) most injured by frost. Vines are now six inches high, and the leaves are prettily variegated with yellowish white.

Further notes crowded out of this issue.

NOTES FROM OUTAGAMIE CO., WIS.

Winter wheat, which is sown extensively in the timbered portions of the State, promises now to be the best crop we have had for years. It stands thick and strong and is heading out finely. More wheat was sown this spring than usual. The ground was in good order and it was sown early; the prospect now is for a big crop. Oats and barley were damaged more or less by the heavy rains which came directly after seeding. Still we hope to harvest an average crop. Corn has come up well, and is ready for a start as soon as the weather gets a little warmer. These cool days and nights are splendid for the wheat, so we do not complain.

The potato beetle is here in force as usual, so those who raise good potatoes will have to fight for them.

The rainy, cool weather which we have been having lately, has given pastures and meadows such a start that we may reasonably expect hay and feed in abundance. The May frosts have thinned the fruit blossoms quite freely, still we have a fair prospect of an abundance of apples and small fruits. Among the latter the wild blackberry which grows freely in this part of the State, fills quite an important place in the list. Its bushes are literally white with blossoms now. Butter and cheese make up quite an item in our farm productions, as do also beef, pork, mutton and wool. Prices of most kinds of farm products are low, but our farmers hope that we have about "touched bottom," and we still live.

June 10. John Rusticus.

RURAL SPECIAL REPORTS.

Oneida Reservation, Wis.

The Oneida Indians were removed to this Reservation from Oneida, N. Y., by the U. S. Government, some 35 or more years ago. The Reservation lies a little back from Fox River, in Outagamie and Brown Co's. The Indians number from twelve to fifteen hundred, all told. The Reservation contains some three or four townships of excellent land, a part of which is divided up into small farms, the unoccupied part being timbered, is held in common. Whites are not allowed to buy these lands, but the aborigines sell and trade among themselves just as other folks do. They have many good farms and farm buildings, comparing favorably with those of their white neighbors.

They have their Chiefs and their Councils, make and enforce their own laws. They have two mission churches and schools, the Methodist and Episcopal Church each having a missionary stationed among them. Many of the men go into the pineries in the winter, and some work among the neighboring farmers during the summer, chopping, clearing land, splitting rails, &c. The women are experts at making baskets which they sell in the towns around. In their season they pick and sell large quantities of wild blackberries which grow in abundance on the lands on which the timber has been cut, and which have afterwards been burned over. They never beg: a majority of them are honest, sober and industrious. They have lately petitioned the Government to admit them to full citizenship. E. N.

Randolph, Vt., June 14, 1878.

We have just had a most refreshing rain, which was precisely what was needed; for the winds and drought of the past three weeks, had left the earth in a very dry and parched condition. Grass is quite light in some localities having no thickness at the bottom. The potato bug made its advent in countless numbers, the last week; and a summer crusade is in prospect for farmers. Grain is looking well, but corn and beans took a severe chill on the night of the 6th inst., that left them rather pale. On the streams, and in the valleys, it froze everything, but the hills were not much affected, although it was very cold, but the winds kept the frost away. Prices for produce are still low. Potatoes, 25 cents per bushel; corn, 56 cents per bushel; oats, 30 cents; butter as low as 12 or 14 cents per pound. The large dairies send their butter direct to market, and receive from 15 to 18 cents, according to quality. The last four weeks have been very cool, with the exception of an occasional warm day. S. H. R.

El Dorado Co., Cal., June 10.

We are having a spell of very peculiar weather; one day will be very warm, above 100°; the next day will be cool and cloudy; the morning will open bright and clear and continue so until perhaps two or three P. M., when clouds will suddenly gather fierce and black. It is just such weather as portends an earthquake. I would not be a particle surprised if there were a disturbance of some kind soon. It is very trying on plants. They have been burned badly already by the sun, an occurrence which, in spite of the dry year, did not occur last season, but altogether we are having a magnificent spring and summer, and were it not for the peculiar changes in the weather everything is fine.

The fruit crop will be up to all expectations: the trees are bending low already under their loads. I do not remember a season when cherries were so plentiful—25 cents a gallon and less, are all they fetch the grower, but then the trees are so thickly covered, it pays. I wish you had a basketful of our Black Tartarian cherries; they are magnificent. Wm. C. L. Drew.

Douglas Co., Ill., June 16, 1878.

When I began to take the Rural, I soon saw I must do better work, have better tools, raise better sorts of vegetables, in short, there must be an improvement all around, if the paper was to be any help to me. Accordingly, I began the improvements. I soon saw two fine ears of corn growing where before one "nubbin" grew. A ten-dollar rooster's oriental notes now peal forth where the cholera-stricken "dung-hill" moped about. Hens that once were laying eggs only at this season of the year, when eggs are worth merely four to seven cents per dozen, are now replaced by hens whose eye to profit prompts them to "hold on" till next winter, when eggs will be twenty-five cents per dozen.

Now, if this is boasting, it is only boasting of what the Rural can do for a negligent, lazy man. A. C. W.

Whitney's Point, N, Y., June 18., 1878.

This month has been wet and cold. The prospects are that the hay crop will be light. Wheat looks well; corn is small for the time of year and the length of time planted; potatoes look fine; bugs plentiful; pastures are good; dairymen are making more butter than usual for the time of year. Butter, 15 cents; eggs, 10 cents; hay, $6 00@6.50 per ton; oats, 35 cents; potatoes, 35@40 cents; bugs at a discount.

M. B. D.

Chautauqua Co., N. Y., June 17, 1878.

The weather for the past few weeks has been cold and backward, and marked with severe frosts. It is warmer to-day, however, than for some time, and we had a nice, warm rain yesterday. Potatoes in many places were badly injured by frost, and it being so cold, corn, garden vegetables, etc., present a sickly appearance. Should it continue warm, things will take a new start. M. L. Dornan.

THE ECONOMIST OIL STOVE.

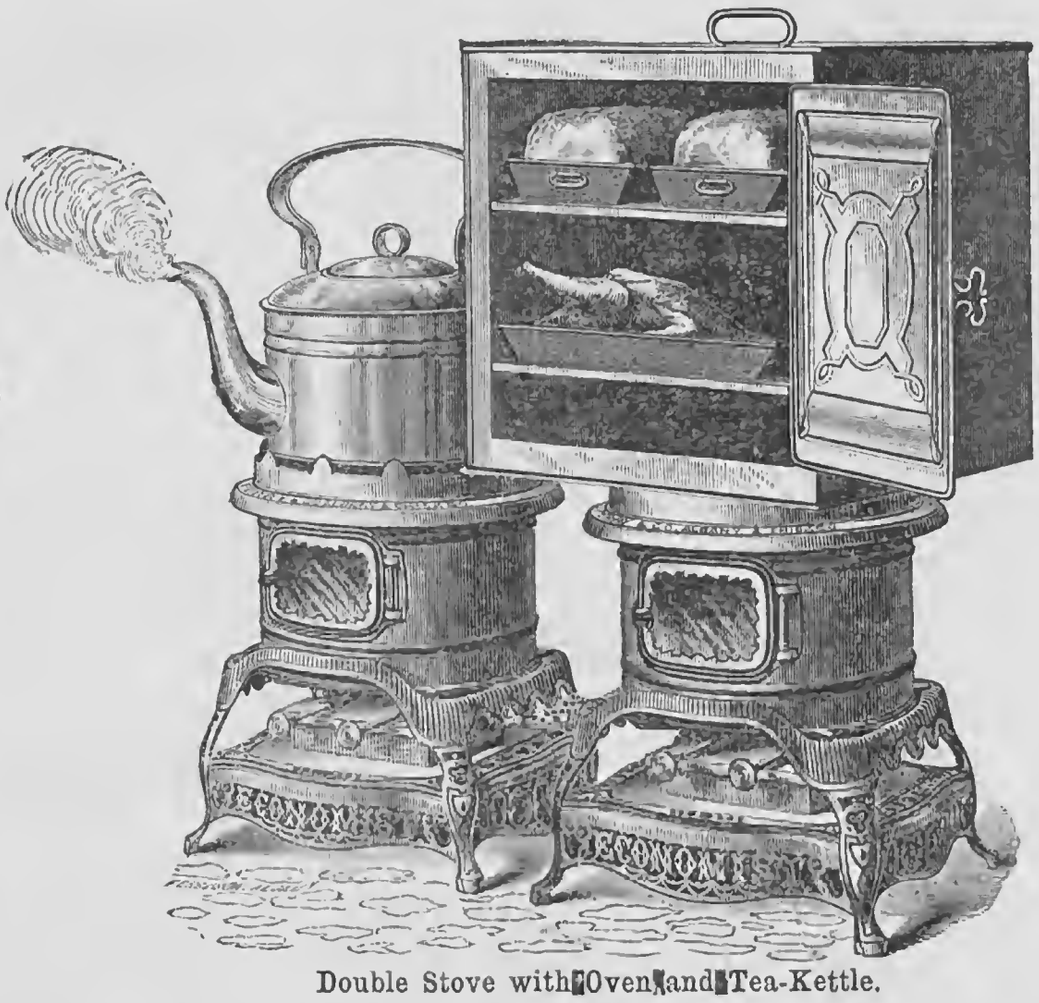
MANUFACTURED AND FOR SALE BY

PERRY & CO.,

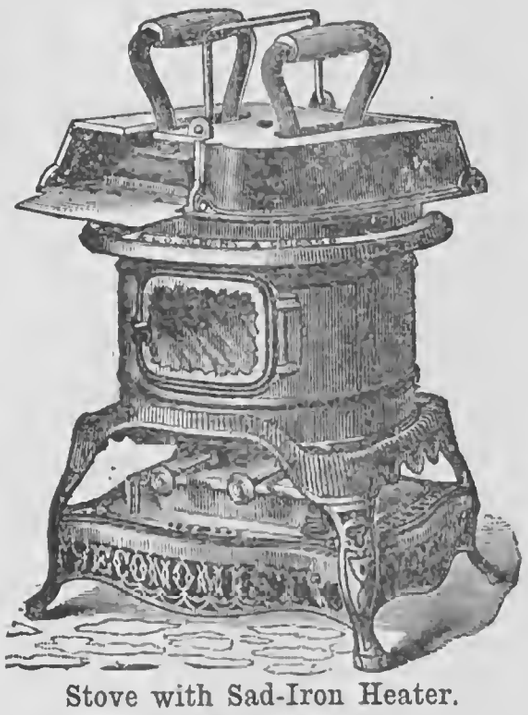
New York City. **Albany, N. Y., U. S. A.**

UTILITY, BEAUTY AND ECONOMY COMBINED.

Stove with Broiler.



Double Stove with Oven and Tea-Kettle.



Stove with Sad-Iron Heater.

For all the varied culinary operations that can be performed with an ordinary Cooking Stove or Range, the Economist is complete. The single stove has ample power to perform the cooking for four to six persons, at a cost of one cent per hour for fuel.

PERRY & CO. manufacture over 100 varieties of Cooking and Heating Stoves and Ranges. They employ 1,500 men in the largest Stove Foundries in the world.

Dealers are invited to send for Catalogues and Price Lists.

GIFFORD'S SWINGING STANCHION. Self-closing, self-fastening. Final farm right in each town for 30 cts. in stamps. For Illustrated Circular, address W. C. GIFFORD, Jamestown, N. Y.

Manufacturers of the best 10 Horse Power

FARM ENGINE

in the world. The Boiler is so constructed as to allow a space of

13 Inches over the Crown Sheet

for steam and water. Very efficient. Perfectly safe. None other like it.

☞ Write for Catalogue and full particulars.

Automatic Cow-Milker.

I have the best and simplest milker in the world, made all of pure silver. It is easily kept clean, and has no flexible or rubber tubes to sour and spoil the milk in warm weather.

It is easily applied, and can be seen while milking that every teat is flowing.

Will milk sore or short teats, or kicker.

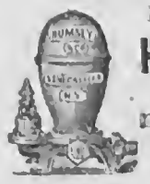
Fractious cows become very gentle by the use of my milker.

It is the cheapest, best and only perfect milker.

It never gets out of order—never wears out.

It will milk any cow very quick.

Price $3 per set; two sets, $5. Single Tubes, 75 cts. Full directions. Agents wanted for every County in each State. WM. F. KLY, P. O. Box 226, Madison Morris Co., N. J.



More than 300 Different Styles

SATURDAY, JUNE 29, 1878

JULY FOURTH, 1878.

It is well to observe the anniversary of our country's independence as a holiday and to celebrate it with bonfires and illuminations, with rejoicings and with thanksgivings. It is also well to give serious thought to matters connected with the existence of our country as a Government, and to ask if the results in the past have fulfilled the anticipations of its founders, and if its present condition gives warrant of future permanence and prosperity, considering meanwhile what are its demands on us, and what are our duties as good citizens. It would be interesting as well as instructive to trace back to their foundations all systems and forms of Government. This would doubtless lead us to the conclusion that in primitive times, the father was supreme head of the family, the law-maker, and law enforcer; the ownership of all property of the whole family vested in him. His dominion extended not only to the property, but to the lives of those under his control; at his death the property was divided among his sons (the eldest sometimes taking a double share as a birth-right), and each son, as the head of his own family, became its ruler.

The first cohesion took place, when at the death of the father his oldest male descendant governed in his stead. This was an aggregation of families and formed the *gens* or house. Afterward the consolidation of houses made the tribe, and of tribes the nation. In all these, although the ruling power may have been changed from patriarchal to chiefship, and given in view of muscular ability or success in war or in the chase, kinship was still the rule. The word nation signifies a number or community of people who have a common ancestry, and the history of Government commences with the assumption that kinship in blood is the sole bond of, and the only possible reason for, political community. Nation made war upon nation, power usurped dominion and made people subject to the rule of strangers.

We have not space to follow the growth of the various forms of Governments that have existed, most of which have been founded on the principle that might makes right; and we will pass on to consider for a moment the constitutional monarchy of Great Britain, a government of two branches—one of which is the King and the other the Parliament—which Parliament is again divided into two branches; one of the representatives of the people (or of such portion of them as are allowed to vote,) and the other of the aristocracy, the members of the House of Lords being born into their position. This branch, however, may properly be considered as an adjunct of the crown, as it may be increased whenever the king sees it best for his own purposes to do so.

This form of government, however, is a vast improvement upon absolute monarchy and good and honest politicians bring strong arguments to show it is the best the world has yet known. The instances where governments by the people have been made in olden times, have been failures. This may have arisen, as many believe, from the fact that intelligence and education were not generally diffused, or it may be that individual opinions were too various and too antagonistic to coalesce. Man, as a rule, is desirous of having his own way, and perhaps power to compel all to submit to certain rules is necessary. Plato, Aristotle, Xenophon, all agree that man is the "hardest of all animals to govern," and more recent authorities concur in their decision.

The form of Government now existing in the United States is really more the result of conflicting circumstances than of deliberate judgment. When the people of the colonies objected to taxation without representation, they had no idea of denying their allegiance to the king. The war of the Revolution had not its origin in the love of liberty. The quarrel was solely one about the rights of a Parliament, which the colonists ignored. The king supported his Parliament, and a withdrawal of allegiance to him was the consequence. The 4th of July 1776, witnessed a confederation of independent States. Notwithstanding the desire of many of the leading men to establish a Government of the same general form as that of Great Britain, obstacles at once presented themselves. States' Rights were immediately asserted. With a monarchy, Delaware and Rhode Island would be little more than pocket boroughs; a Republic was determined upon, because nothing else was feasible. After much difficulty a Constitution was adopted which was really satisfactory to only a small majority, and which was fitly termed "a bundle of compromises," but which was accepted as the best that could be had under the circumstances.

Under the Constitution with its various amendments the country has existed as a Republic for nearly a century. Unsatisfactory as it was in the beginning, it is little less so now. JEFFERSON said it was impossible to frame a Constitution that would out-last more than one generation. By patching, this has lasted three. The growth and prosperity of the country have been unprecedented and unexpected. The machinery of Government has become unwieldy and difficult to manage; but after all, where is there or where has there ever been a better Government; one by which the interests and welfare of the whole people have been better subserved?

We do not lose sight of the fact that it is not perfect, and that in many particulars it is susceptible of improvement, but with all its faults in full view, we are ready to join with the readers of the RURAL on this anniversary of our Country's Independence in giving

THREE CHEERS FOR THE UNION AS IT IS.

But because we can join in rejoicing that our Government is so good as it is, we are not blind to the fact that it could be immensely improved, and would be if citizens did their duty. We will append a few questions which seem to us to be worthy of careful consideration by every one. For instance:

Should not the Presidential term be lengthened, and the President rendered ineligible for re-election, having a seat in the Senate for life?

Should not suffrage be in some way made dependent on the possession of intelligence?

Should not some means be adopted by which the expenses of government should be paid more directly by the people?

Should not the Civil Service be improved to the extent that no officer or clerk of the Government should be discharged without good cause, and after a hearing?

Should not the number of Representatives in Congress be reduced?

Should not every citizen be as particular in selecting men to manage the affairs of the nation as he would be in choosing an agent to manage his own private affairs?

Does our Congress, judging from its actions during its last session, seem to be composed of men who are fit representatives of the average intelligence and moral culture of their constituents? If not where is the fault?

These are by no means all that occur to us, but if the voters who read these will give them thoughtful consideration, and act and talk and vote in accordance with their honest conclusions, it will be a step, and a long one, toward Reform.

WHEN TO VENTILATE CELLARS.

SOME of our contemporaries advocate airing cellars during the night and closing them during the day, to prevent dampness. The theory is that the hot air during sunshine holds moisture that is condensed in the cool cellar, while at night, the temperature outside and in the cellar being more nearly alike, there is less dampness. This strikes us as bad advice, though true enough, so far as we know, as a fact. A damp cellar is not necessarily unhealthy if it is kept clean and pure. When cellar windows are opened the colder air passes out producing a partial vacuum. This induces the air which has been warmed by the sun's rays to enter, when, by cooling, it is deprived of a part of its moisture and as before passes out and thus a constant change of air is maintained. But the warm, moisture-laden air is free from the poison of those malarial diseases with which night air in valleys or low tracts is infected. Carbonic acid also, the result in part of slow decomposition of vegetable substances, is dissipated by sunshine, while at night it accumulates in all low places, its specific gravity being about 1. 5. while that of air is 1. 0.

For the same reason, therefore, that people in what may be called miasmatic districts should confine themselves to the house from two hours or more before sunset until two hours or more after sunrise, they should close their cellars during the same time. And the cellars should be opened and ventilated, no matter how damp they may become in consequence, during those hours when the sun shines brightest.

The Farmer's Front Yard.—Most farmers, even the poorest of them, have a desire for trees, plants and flowers. They enjoy a well-kept place. It is a very rare thing to find a front yard without some attempt at ornamentation. The shrubs and flower-beds and the grass are often neglected and allowed to struggle with each other in their own way. Some work is occasionally done at odd intervals. A small spot is dug in the grass for a single rose-bush, another for a small Spiræa, one for a Lilac, another for a Pæony, and perhaps several others, two or three feet across, for small beds of flowers. In this manner the grass plot is broken up and frittered away by numerous single plants or small beds scattered all over the yard. Except, perhaps for a few vines, we should set plants a little away from the house. Besides this, for unpretending yards by farm houses, we suggest a plan which, at a less cost, we think, will make the yards look better than they now look.

The ground for the lawn should be nicely graded and enriched, taking care in most cases to preserve the natural gentle undulations. In several places here and there, depending on the size of the grounds, set shrubbery or flowers in masses of not less than ten feet in diameter. Plants in small beds cut out of turf seldom thrive well, because the grass roots run down beneath the plants, often for three or four feet, robbing them of moisture and nourishment. In the plan leave clean open spaces free from everything but grass. This can then be easily mowed several times a year.

If the land is rich and well graded, the grass can be easily mowed and it will furnish a crop which will be handy to feed the horses or some other stock. Locate the tress and shrubs somewhat with reference to making it easy to mow the lawn. The patches or groups of shrubbery should be often cultivated, at least till they become well established. A nice lawn is the most beautiful part of a well-kept front yard.

BREVITIES.

ON appelle l'attention do nos lecteurs français sur l'article de M. Marvin sur la vigne. Ils y trouveront des idees nonvelles sur ce sujet important.

IT is time to pinch off the shoots of Raspberries and Blackberries.

WE picked our first ripe red raspborries from Highland Hardy the 22d inst.

OUR contributor, W. C. L. Drew, predicts an earthquake for California soon.

SEVERAL cases of persons being poisoned by the careless use of Paris-green have been recorded during the past two weeks.

WE heard a lady say admiringly of a large rose: "It looks just like a pæony!" Was this a compliment for the rose or the pæony?

THOSE who fear mildew upon grape vines will do well to dust the leaves with sulphur now, repeating every week or so until the grapes begin to color.

MR. MARTI tells us, writing from Southern Texas, that it is only in very favorable seasons, standing in some protected nooks between buildings or high places, that bananas ever "ripen their" fruit thereabout.

Mr. J. J. THOMAS says—and many others have said the same—"Buy your trees of a nurseryman who has established his reputation." If everybody follows this advice, what we want to know is: How is a nurseryman to establish his reputation?

NEW raspberry plantations may now be formed as well as at any other season of the year and better, we think, if the ground is moist. Secure all the fibers that can be secured, and plant deep. Shoots from a few inches to two feet may be selected.

IT is a good idea to plant late peas now upon ground intended to be used later for new strawberry plantations. When the peas are picked, the haulm may be removed, the ground well enriched, and the strawberry plants set so that they may get well established before frosts.

WE respectfully announce that all renewals of subscriptions, or new subscriptions, not received at this office before July 4th, will not be entitled to the cricket. To avoid misunderstanding and disappointment, we are obliged to make this rule, which, unlike other rules, will have *no* exceptions.

THE United States have now sufficient monied men to invest in land, and avoid the deplorable despoiling of the rich soil nature has produced. Companies can be formed for any business transaction, and thousands up to millions employed, but agricultural, and especially stock-raising enterprises, would pay far better if properly conducted.

CAPITAL FOR FARMING.—Any man entering upon agricultural pursuits without money, has to commence on a system of robbery and continued taking out of the land the fertility till he has sold enough to buy stock, when if he breeds from his animals and keeps a good deal of the progeny, he may in time repay his exhausted soil; but it is a great advantage to have money and farm without any debts at starting.

FARM GATES.—Depend upon this assertion: A good well-hung gate will save its cost the first year in the time saved by stopping to put up bars whenever anyone passes. Farm gates are pleasant for master and men, and in England there are good, substantial ones into every field on the farm, and all have good, safe latches made to open easily with a riding stick or whip, so that a farmer can go all over his farm without dismounting. There are no wagon-ways of any kind without gates for the convenience of equestrians.

SOROSIS, ATTENTION?—If the ladies of this society, for whom we have the highest respect, are really in earnest in their professed efforts to ameliorate the condition of their sex, they should at once introduce a rule existing, as reported, in a Women's Club in Warsaw, which provides that no member shall wear a morning dress costing more than $25, no evening dress more than $50, and no bonnet more than $7.50. And further, that at each quarterly meeting each lady must declare that she is not indebted to either milliner or dress-maker. Such an example as this would do more to encourage others than a host of appeals, addresses, and circulars, and the money that could be saved by such economy could be well and profitably spent; or, perhaps enough could be accumulated after a little while, to establish a Women's Hotel on a plan that would prove successful.

J. J. MECHI says, in the London Times, that the inferior condition of crops on undrained lands, as compared with those on land drained artificially or naturally, is something astounding, and indicates that, in such a season, much of the prime cost of draining is repaid in a single crop. In the stagnant water the plant-fibers, rot; not so in the water moving and passing down to the drains. If he were a landowner he would not permit his tenants to farm his land undrained, because it would often diminish their rent-paying power. He knows many cases where the borrowed capital has been repaid by an annual charge, which the increased crops more than repaid. Where a doubt exists, a part of a field only should be drained, and the contrast would convert the unbeliever. If he proposed to a farmer to put a cork in the hole of each flower-pot, the farmer would call him, or consider him, foolish and unreasonable; but how seldom he removes the cork from the great outside plant-pot!

THE N. Y. Hort. Soc'S. Exposition opened at Gilmore's Garden on the evening of the 19th, closing on that of the 21st. We had prepared a short report of the beautiful and varied display of plants there to be seen which an unusual pressure upon our columns excludes. All people who love plants should attend these exhibitions even though a window-garden is all they can cultivate at home. Everything is plainly labeled and there are those in attendance who can give almost any desired information whether for hot-house, green-house, room or out-door cultivation. The following are among those who took the best prizes: MRS. W. J. DAVIDSON, wife of the Secretary, for dinner-table floral decorations; E. P. ROE for Strawberries; Dr. F. M. HEXAMER, for Strawberries: PARSONS' SONS & Co., for hardy evergreens and Japan Maples; GEO. SUCH, collection of rare hot-house plants. The Great American Strawberry exhibited by a number, disappointed all. Many other varieties were of larger size, and size is its only claim to greatness. The present is not a fair season to judge of the merits of any Strawberry, though as unfavorable to one variety as to another. In our own grounds the Great American has grown no larger than Borden 30, while it is as nearly tasteless as a Strawberry well can be.

COMMUNICATIONS RECEIVED FOR THE WEEK ENDING SATURDAY, JUNE, 22D.

Literary Miscellany.

THE PORCELAIN CUP.

Who watched the artist paint a porcelain cup,
Did wonder when he gathered brushes up
And said, "My task is done,"
That on the toy's fine rim,
A border black and grim
Contrasted hatefully with gentle tint
Of pink and azure, blonde and beryl hint,
And mocked those threads of sun
That made the cup a prize
To ravish royal eyes.

'Why leave this scowl of black?" one dared inquire,
The artist answered, "Clay must taste the fire,
And by that test he tried,"
Snatched from its furnace heat,
Transfigured and complete,
The dazzling gift comes crowned with aureole gleam
Its black all changed to gold! So—like a dream
Heart said to heart that sighed—
Grief may be joy at last,
When life's fierce feast is past. [*Observer.*

CORA.

(Continued from page 393.)

"Has it, indeed, been so bad, poor child?" he said, wearily. "Cora, I did not know, I did not imagine. You know I told you that I would do anything to make you happy; but I am powerless," he added, sadly. "Tell me what I can do for you. You must know that even if I did not care, it is my duty to do what I can to contribute——" His voice faltered, and he hesitated.

"I can hardly believe you care," she said, without bitterness now, but with an intense sadness. "You have judged me severely, and you have given me no chance of justifying myself. Had you loved me——"

"Ah, hush!" he interrupted, mournfully, beginning to pace up and down the little room. "You cannot keep up that farce, Cora. You know that I loved you. You know that, Heaven help us both, I love you still."

"You love me!" she answered; "you love me and believe me infamous?"

As she spoke she turned to him, lifting her wondrous eyes, full of sorrow, and reproach, and love, to his, and putting one little hand gently upon his arm. For a moment, one moment only, he hesitated, then he caught her in his arms, and pressed his lips passionately and repeatedly to hers.

"No," he said, tenderly, "I will believe only you, Cora. Will you try to forget the past, dearest wife, and let us begin anew? Oh, my darling, my darling, whatever your faults, I have been terribly harsh, and you have much to forgive; but if the tenderness of a lifetime can obliterate my cruelty, I will atone for it."

In his arms, held close to his beating heart, Cora stood trembling and quivering, hardly daring to believe that the lost happiness was hers again.

"Will you forgive me, Cora? will you pardon the madness which forced me to behave so cruelly? Ah, my darling, if you could know what I felt just now when I saw to what an extremity my conduct, my abominable harshness, had driven you?"

"Not your harshness, Alan," she whispered, with her face bowed upon his breast and her little hands clinging to him with eager tenderness, "my own pride. Ah, if I had prayed you to hear me, instead of being too proud to give you the explanation which was yours by every right, we might have been saved much suffering. Alan," and she raised her eyes wistfully to his, "you will not refuse to hear me now?"

"I do not want any explanation, darling wife," he said, tenderly, between the kisses which poured thick and fast upon her throat, and face, and hands. "I will trust you all in all, beloved, and nothing shall ever part us again. That you were not happy I knew, but the real extent of your misery I never fathomed until to-night. How can I excuse myself, sweetheart?" he went on. "My own excuse is this."

He took from his pocket the little note he had found in the railway. Cora recognized it at once, shuddering and drawing nearer to him as she recalled that terrible journey.

"I never wrote it, Alan," she said, earnestly; "it is like my writing, I acknowledge; but I never saw the note until Lord Almane showed it to me in the train as the reason for his presence there. Alan, you believe me, do you not?"

"Fully, darling; but there is some underhand conspiracy against us, I feel sure. Did he—Lord Almane—think that you had written that note. Cora?"

"Yes, I am sure so. Alan, let me tell you all; do not refuse to hear all, I pray you; you will not, dearest?"

"Not if you care to tell me, dear wife; but I want no explanations. You forgive me—that is all I want now."

"Nay, but I must tell you," she said softly; "I cannot be happy without. I must tell you; but not here—not here."

She shuddered faintly as she glanced at the fragments of the broken phial and the small, dark stain upon the carpet. Sir Alan put his arm round her, and led her gently into the studio. It was unlighted, save by the silver stream of moonlight which stole in through the windows; but, dimly as this light showed the surrounding objects, it was sufficient for Cora's purpose, and, with her eyes hidden and her hand clasping one of her husband's, she told him all—from the first meeting with Viscount Almane in the crowd, to her last at the railway station at Amiens.

"You believe me, do you not, Alan?" she said, in conclusion. "I never loved him, even when I loved him best, as I love you; his treachery never made me suffer as one unkind word from you. No, no; I don't mean any reproach. I never blamed you really, even when my heart was sore; I loved you too much ever to be angry, Ah! do not, dear Alan, I am so happy; and there are tears in your eyes—I felt one upon my hand, and it hurt me, ah! so much!"

"My poor little wronged wife!" murmured Sir Alan; and for some minutes he held her to him in a long, close embrace, which seemed to blot out the remembrance of the past.

CHAPTER XXIX.

When both were calmer, Cora disengaged herself, and got a light.

"I am tired of darkness," she said playfully. "Come into my room, Alan, and I will make you some coffee. You must want something, dear, after such a long, cold ride."

He submitted, smiling, watching her as she moved about, full of gentle, womanly attentions to his comfort, with a softened tenderness on her pale face which had long been a stranger there. Once or twice her lip quivered, and he guessed rightly that she was thinking of her dead child; but when she came to his side and met the sad look with which he regarded her she bent over him with a little smile, infinitely sweet, infinitely tender.

"Are you not better to me than ten sons?" she whispered softly; and Sir Alan could only press her to his heart, and kiss away the tears which had gathered in her soft, sweet eyes.

"I have a restitution to make to you, wife," he said, after a time; "and when I have received absolution for my theft, I will entreat you to go and take some rest. Cora" he continued, "on the night our little one was taken, this was brought to me, and I have had no opportunity of returning it to you."

Cora took the letter and recognized it immedirtely as the one which George Leeson had brought her from Lord Almane, and which she had entirely forgotten in the distress of mind she had endured since that period. Her color rose a little, but she put the letter back into his hand saying, quietly:

"Shall we read it together, Alan?"

"Darling, I trust you fully," he said, tenderly.

"It will please me, Alan. It may throw some light upon those things we cannot explain."

"Then read it to me, wife."

Cora broke the seal and began to read, but in a few moments her voice failed her, and she broke down.

With his arm round her and her head resting against him, Sir Alan took the letter, and in his soft, grave tones read as follows:

"If I swore never willingly to see you, I did not swear not to write to you, Lady Cora; and although you may think it unpardonable presumption, it is but fair to you and myself to have some little light thrown upon what may seem to you inexplicable. Ever since the first moment I saw you I loved you; it was neither infatuated admiration nor friendly regard; it was love; and as it seems my province to bring suffering on those I love, so I fear have I brought suffering on you. Yes, I loved you, but at that time I was bound to another; and although I would willingly have kept you in ignorance of my engagement to Lucie Belmont, you learned it by chance and rejected my proffered love—rejected it with pain, Cora, for you loved me. I did not care for Lucie; beside beauty such as yours, the few charms she possessed were pale and dim. But, alas! she was rich; and my past life, even when I met you, demanded that I should retrieve my impaired fortune. By some chance she learned my affection for you, and broke off the engagement to leave me free, she said. But I could not afford a penniless wife, and, though I was free, I did not seek you, Cora. I went abroad; when I returned to England I found you the wife of a man who loved you, and I myself, if not quite forgotten, was regarded with indifference. My passion for you was as strong as ever, and when I saw you so beautiful, I vowed that you should be mine by fair means or foul. I knew you had loved me once; you should do so again. Accident favored me; your husband is jealous, and though, Heaven knows, he has no cause, still it was easy to make him mistrust you. Your agitation when we first met was a favorable sign for me. He noticed it and wondered. Soon I received an unexpected ally, one who hated Sir Alan Vincent as much as any cold-blooded cur could hate. I mean the servant, Marks. He had but one stronger motive—his love of money—and this I willingly gratified. He kept me *au courant* with your husband's actions and your own. By his connivance I was enabled to meet you unexpectedly, and to follow you to Paris; while by every means in his power, he instilled the poison into Sir Alan's mind. Soon it began to work, and then his coldness and harshness unconsciously assisted my designs. You were unhappy, my sympathy was not displeasing to you, and I began to hope at last. Now for the most humiliating part of my confession, Cora. The man Marks has one accomplishment: he is an accomplished expert, not in detecting, but in doing. He can imitate any handwriting with perfect ease, and we called this accomplishment into play—I once, he twice. This will explain the letter to George Leeson, which you thought Sir Alan had written, and which, by the agony it caused you to think yourself unloved, almost won my cause. It explains also the note he brought me from you, by which I was duped and deceived. He is a clever conspirator, and although your husband's appearance at the station at Amiens was owing to chance, it disappointed him by preventing our flight. Still he succeeded to a great measure, he obtained large sums of money from me and satisfied whatever may be his dislike to your husband. I have told you all now, Cora. When you get this letter I shall have passed out of your life for ever. If I loved you selfishly I loved you well, and for the sake of that love forgive me if you can. Had I loved you less I might have given you up more easily; but I know now, that not only do you not love me, but your whole heart is given to your husband. Be it so, he is worthy of it; his only fault speaks of his love for you, and you must be unlike most women if you do not feel flattered by his jealousy. Be happy, and tell him—the man you love—the husband you esteem and reverence so highly—that even were he poor, wretched, disabled, he is still to be envied, possessed of such a treasure as your love."

"That is all," said Sir Alan, softly, closing the letter and placing it on the table beside him. "We can afford to pity him, Cora."

"Yes," was the quiet answer, although her tears were falling fast—falling at the thought of that misspent, ruined life, which might have been noble; at the blurred and blotted history which might have been fair and stainless. Suddenly she lifted her head.

"What happy chance brought you home to-night, Alan?" she said. "I did not think you would return until to-morrow morning."

"It was hardly a chance, my child," he said, gravely. Then he added, in a lighter tone: "I hardly know why I came. I rode down to The Bungalow and told my mother all our trouble, Cora, and she scolded me so heartily for distrusting my sweet wife that she made me quite ashamed and confounded. So I rode back to implore your forgiveness. Thank Heaven," and he clasped her closely, "that I returned."

"What can have caused Marks to dislike you, Alan?" she said again, after a pause. "I did not think you had an enemy in the world but one."

"I really don't know," said Sir Alan, musingly. "I think Lord Almane must be mistaken in imagining such a thing; it was the love of greed I suppose, and a natural inclination to evil. It was strange how you always mistrusted him, Cora. Perhaps some day we shall know more about it, love; but if we do not, we are content to let it rest, are we not?"

"I am quite content, Alan," she answered, softly. "Content to leave all in your hands, only, dear husband, if at any time you think you have reason to doubt me, you will come to me straight, will you not? and scold me as I deserve."

"I will never doubt you again, Cora," he said, tenderly. "You have forgiven me, but I cannot forgive myself. I think the lesson I have received will be a lasting one, my darling, and my insensate jealousy will be expelled for ever and aye."

CHAPTER XXX.

Mr. Marks on the Tapis Again.

"Can you spare me half an hour this morning, Vincent?" said George Leeson, appearing at the door of the dining-room, where Sir Alan and Lady Vincent were sitting at breakfast. "Excuse such an early intrusion, Lady Cora, but I have business of importance."

"Sit down, and have some breakfast," said the baronet, as they shook hands; and Mr. Leeson went across to Cora, who sat before the urn, looking very pretty and fair in the soft black dress, relieved at the throat and wrists by delicate white frills. She gave him her hand with the old gracious sweetness, so different from the proud, cold manner she had worn for so long.

"Thanks; I have breakfasted already; but I will take a cup of coffee, Lady Cora, if you will kindly give me one. You are rather late people!"

"Not generally," said Cora, smiling. "To-day is an exception. Where do you think we have been since last week, Mr. Leeson?"

"I heard you were away; I concluded you were staying with Lady Vincent at The Bungalow."

"No," said the sculptor; "we have been as far as the Eternal City and back. Spent two days there, just to renew old association, and came back."

"Rapid traveling," said Mr. Leeson, smiling. "Why did you not take a Cook's tourist ticket?"

"How do you know what we did?" said Sir Alan, smiling; "also, we're not *millionaires*, Mr. Leeson, whatever you may be."

"Oh! Alan," said his wife, laughingly, "how can you be so absurd? I wanted so much to go," she added, turning to Mr. Leeson, with a little sadness stealing over her face, "and Alan indulged me, but he could not spare any longer time."

"I met an old acquaintance of yours, Vincent," said the painter, as he stirred his coffee. "Quite by chance, the other day, I found that he lodges in the same house as myself in Elm Tree Walk."

"Indeed! Who is that?" said Sir Alan, looking up, with some curiosity in his face.

"Your ex-footman, Mr. Marks," was the quiet reply.

Sir Alan started.

"I am very glad to hear it," he said, heartily. "Now we will come to the root of the tree, I hope. You did not make yourself known to him, Leeson?"

"Oh, no, of course not; but we had a few minutes' conversation. He is secretary now to some new assurance company, having purchased his secretaryship with some of his ill-gotten gains, I suppose. Take my word for it, Vincent, that the man will receive his deserts yet—murder will out, you know. He is as mild and gentle as milk-and-water, and looks quite benign and trustworthy in a suit of superfine black; but the cloven foot peeps out, in spite of all."

"I'm afraid one may soil one's hands by contact with such a scoundrel," said Alan, savagely; but meeting an alarmed glance from his wife's sweet eyes he subsided and gave her a reassuring smile. "I should like to know if he had any other motive but cupidity for his treachery."

"So should I," said the other; "and for that purpose I have invited him to luncheon at my rooms at one. Will you come? I won't ask you to sit down with the fellow, but you can have an explanation instead of a luncheon."

"Of course I will come. You need not be afraid, little wife; I won't strangle him. I won't even touch him."

"I have a message for you from Lady Lucie Belmont," said Mr. Leeson, coloring a little. "She wants to know, Lady Cora, if you will go out with her this morning. I believe the object is one especially delightful to the fair sex—shopping. I know Marshal and Snelgrove's names were mentioned. She will call for you at twelve."

"It is almost that now, Cora, so if you are going, go and get ready. Will you have a cigar, Leeson, while we are waiting?"

Cora went away: and returning just as Lady Lucie's carriage arrived, the ladies drove off together.

Half an hour afterwards Sir Alan Vincent and Mr. Leeson got into a hansom, and drove to Elm Tree Walk. It was one of the quaint old streets down by the water, overlooking the broad river as it flowed calmly on, and inhabited principally by artists of all kinds and students, who lived a merry *sans façon*, Bohemian life, which George Leeson liked, notwithstanding his veneration for "Burke's Peerage" and "Baronetage," and which was not without a certain charm for Sir Alan himself.

It was strange that Mr. Marks should have chosen such a locality, unless his choice could be accounted for by the hope of meeting no one among the Bohemians who would recognize him in his former career. Perhaps he had a lingering fancy for Bohemianism himself, notwithstanding his snug, respectable exterior. Anyhow, there he was, lodging in the same house as Mr. Leeson, and behaving with exemplary politeness and amenity to all.

George Leeson's studio possessed an unmistakable air of bachelorhood. The floor was strewn with rugs and mats; the furniture consisted of sundry large and comfortable arm-chairs; there was no small display of bric-a-brac, principally china, of wondrous shapes and sizes; while an odor of tobacco pervaded the apartment.

Throwing themselves into two of the above-mentioned arm-chairs, Sir Alan and his friend waited for the advent of Mr. Marks.

Punctually at one o'clock Mr. Leeson's servant threw open the door and announced:

"Mr. Marks."

The host went forward, with careless ease, and gave him a courteous welcome; but Mr. Marks had caught sight of a tall figure standing by the window, and recognized at once the stern, handsome face of his former master.

"Allow me to introduce you to my friend, Sir Alan Vincent," went on George Leeson, without appearing to notice the sudden pallor which overspread his visitor's face, "he is anxious to make your acquaintance."

"You do not seem equally anxious to make mine," said the baronet, advancing; "how is that, Mr. Marks?"

For a moment the man seemed non-plussed, but he soon recovered his self-possession, and murmured some few words about "natural surprise and pleasure," which Sir Alan returned with a careless nod.

"I hope Lady Cora is well," went on Mr. Marks, with a hypocritical smile; "and her ladyship, your mother."

"Very well, I thank you," said Sir Alan, haughtily, with difficulty restraining himself.

"But you must be aware that I did not come here to exchange greetings with a rogue—I speak the word advisedly. I came here to obtain a little information on a subject which I need not define further."

"I do not undertand you Sir Alan," replied Marks, shifting his blue eyes uneasily from the mat at his feet to Sir Alan's face, and Sir Alan's face to the mat again.

"Are you sure? have you forgotten? The occurrence is not so very distant. However, I will refresh your memory. May I ask you why you committed daring forgeries in my name and my wife's You had, it is supposed, some other motive save the money you received from the person who employed you at the time you were in my service. You may spare yourself further falsehood; he himself is my informant."

The man hesitated, but he saw that he was detected; and was acute enough to know that such a thing would never be publicly brought against him.

"Yes, I had another motive," he said, with apparent frankness; "I entered your service in order to gratify my dislike to you, Sir Alan."

"I am highly honored!" said the baronet, coolly. "What have I done to incur such an unfortunate feeling?"

"Both dislike and revenge," was the reply "I have owed you a grudge for a long time, Sir Alan. I have had a most ample, if not complete, revenge. Do you remember," he went on, coming a little nearer, and speaking with the evil gleam lighting up his face, "one evening, a cold winter's evening, about three years ago or more, when Miss Sinclair was crossing the common at Pierpont with a maid, she was addressed by a passer-by, who offered to escort her home, and only asked a kiss in payment? He would have got it, too, had you not approached."

The man's face darkened as he proceeded. Sir Alan went white with anger, but did not interrupt. George Leeson, beside him, clenched his hands, and was heartily glad that he had promised no one not to administer chastisement to Mr. Marks.

"You took the man by the collar and threw him into the ditch, with as little ceremony as if he had been a dog, and left him lying there, on a bitter winter night, without giving him another thought, I daresay. If you recollect the occurrence, I daresay you have not forgotten what the man called after you as you went away. You heard him and laughed. You did not always laugh, Sir Alen; I have seen you look very miserable, and I remembered then that I owed you a grudge, and that I had sworn to 'pay you out.' Your turn came at last. I lost sight of you for a time, but when I found you again was even with you, I think. I had not a very pleasant half hour in the ditch, but you have had many a sleep-

less night since, Sir Alan Vincent, and I helped to make them so."

He ended with an air of bravado and defiance, which exasperated Sir Alan to the highest degree, and it was only with the utmost difficulty that he restrained himself, remembering his promise to Cora.

"You pitiful scoundrel," he said, scornfully, "to cherish animosity for a justly-deserved punishment. You had better not presume upon my patience too far, or you may find that it has its limits."

"I know what keeps you from kicking this fellow down stairs, Vincent," said George Leeson, unable to keep down his irritation; "but I am bound by no such promises. I should advise you to keep at some distance from me in the future, and to relieve us of your presence as speedily as possible."

Marks took the hint and disappeared, and the next day, when George Leeson's landlady lamented the departure of her second-floor lodger, "such a quiet, well-spoken gentleman, no trouble to nobody," the artist knew that as well as the hint he had taken the advice.—[To be continued in our next.

GERALD SORTHWICK, TEA-TRADER, CHINA.

H. H.

A long stretch of velvet lawn, bathed in delicious golden sunshine. Four people finishing a game of lawn-tennis, and as many looking on with a kind of lazy interest. On either hand shady shrubberies, bordered with brilliant flowerbeds; at the end of the lawn a little brook; in the distance the long sweep of the Cotswolds.

"Fifteen," counts Captain Hall, triumphantly, as a vicious stroke of Gerald Sorthwick's racket drives the ball beyond bounds. Gerald has played badly throughout, almost in silence, with a grave face and compressed lips. It does not matter, for his partner, Maud Conway, has exchanged with Captain Hall enough merry badinage for a dozen people. The young lady is nettled now at an ignominious defeat.

"I could wish you victor in a better contested fight, Captain Hall."

"It is my highest ambition, Miss Conway." There was nothing in the words, but the meaning, tone, and a low bow gave them point. Maud bit her lips, and Gerald threw down the racket, his face a little sterner than before. She turned to him, an angry glitter in the violet eyes:

"Your play has been wretched, Mr. Sorthwick; it was never worse. For the future we dissolve partnership."

"Can we? *Can* we, Maud?" *He* speaks meaningly now, and it seems strange her name can come with such tender inflection from so hard and firm a mouth.

"'Maud' to my friends, sir; 'Miss Conway' to you."

He leaves her, and saunters into the shrubbery, following a little winding path until it reaches the brook. Then he throws himself at full length upon the soft moss, and thinks bitter things of the girl who has befooled him. Half an hour later there is a rustle among the boughs, and he sees her in the act of retreating.

"I am sorry I disturbed your slumbers, Mr. Sorthwick. I thought you were gone."

"You disturb my *life*, Maud, waking and sleeping. Come here."

He spoke with such command, she instinctively obeyed, but her whole soul rose in rebellion. It was a novel experience to the spoiled and petted beauty.

He pointed to a low, rustic seat, and she took it. As though to measure strength, they look into each other's faces—his pale, determined; hers passionate, resentful. Then Gerald turns his head away, lest resolution should fail. His tone is low, but full of fierce, suppressed energy:

"You have not played with my love for months, Maud, without learning what it is. It comes between me and all other chance of happiness."

He pauses a few seconds, wherein she plucks a wild-flower, and picks it to pieces. Sweet and pensive she looks now, and unwontedly thoughtful; but his eyes are on the distant hills.

"From time to time, when I would have spoken, you silenced me, and I thought it girlish coyness. You made me believe you cared, Maud."

If only he would look now, and see how the girl's mobile features answer the sorrowful wail in his voice! But he does not.

"I saw you flirting continually, but it was your nature, and I did not mind, for I thought you gave me more. So you fooled me as you fooled others."

"Fortune-hunters, all of them," she broke in.

"Possibly," and his proud head was thrown back a little. "I am free from that imputation. Rich as you are, Miss Conway, the Sorthwicks of Sorthwick are richer."

It was true, as she knew well. General Sorthwick, the elder, had the reputation of being the wealthiest landowner in the country, and he was the only son.

"It is time the farce were ended," he continued. "I have been too long the willing slave of your caprice. It is not fitting the woman I honor above all the world should be on terms of free and easy intimacy with such a man as Captain Hall."

A contemptuous curl of the lip emphasized the words.

Maud started as though they had stung her; her hasty temper in arms immediately.

"By what right do you venture to criticise my friendship, sir?"

"You shall give me the right," he rejoined, hotly, "or from this day I will never willingly touch your hand nor see your face. Friendship! what is that beside such love as mine? Choose between them, Maud: his friendship or my love. I will never ask you again."

This desperate earnestness almost frightened her; nevertheless she made a mocking curtsey.

"Love may desolate and grieve you,
Love may stay awhile and leave you,
Friendship's truth will ne'er deceive you,"

she quoted. Then he fairly turned his back for some seconds, that she might not see the pained working of his features.

He was pale to the very lips when at length he did look, in silence offering his hand. Silently she laid her own in it. The agony in his eyes subdued her; what was a woman's weak petulance in comparison with this?

"For the last time," said Gerald Sorthwick. He bowed low over the white fingers, and kissed them; then walked away. She heard a horse's hoofs presently, at a furious gallop.

The lodge-keeper touched his hat as Gerald rode up, and he saw with surprise there were great tears on the old man's rugged cheeks.

"What is the matter, Williams?"

"Have you not heard, sir? I thought you knew from the rate you came, and the look of your face."

"No—no—what is it?"

Williams whispered a few words. Gerald swayed to and fro in the saddle, and would have fallen, but that the old man supported him.

"Strange news!" said Captain Hall to a friend that night. "Old Sorthwick is ruined and has shot himself."

"Nonsense, man; he is as rich as Cræsus.

"Yes; fabulously so, that is, he mortgaged every acre years ago, and bought Turkish bonds; that accounts for his large income. They have just stopped payment, you know, and other speculations have turned out much worse. The young cock will crow less loudly now, will he not? And an evil light gleamed in the speaker's blue eyes.

* * * * *

Silvery moonlight flooding a farm-house, and an unusually large garden appertaining thereto. Up and down the gravelled walk paces Gerald Sorthwick, moodily smoking a fragrant cigar. On the air is borne a sound as of an irregular bass solo, varied by the occasional squeak of shriller stringed instruments.

It denotes that half a mile off, in the little town of Sorthwick, an archery ball is now being held. The committee, in view of his father's recent death and his own social ruin, had decided not to send the customary reminder; but Gerald, with a poor man's morbid sensitiveness, misinterprets the kindness. With an impatient movement, expressive of disgust, he tosses away the half-smoked cigar. It alights on the soft turf of a small croquet-ground, and lies smoking. Then, with a curious smile, he crosses and picks it up carefully.

"I had forgotten myself," he mutters: "the last of the box, and a brand I am not likely to taste yet awhile.'

So, with the cigar between his teeth, he passes through the gate, and across green meadowland towards the town.

The music grows distinct as he approaches.

"I think I am wise," he reflects, bitterly. "To-morrow by this time I shall have left the old life quite behind me. Gerald Sorthwick, tea-trader, China. Vague, that, and it is about all I know: but I shall be better out there. The old position, habits, instincts, reminiscences, would be so many dead weights in England."

A wealthy tradesman passes him, and touches his hat. Gerald acknowledges the courtesy with that marked politeness which has ever won him popularity with his social inferiors, but the incident re-awakens latent cynicism.

"How long would that last?" he wonders "Formerly it meant your are my patron, ten times richer than I. Now it should be for me to doff the hat in greeting."

The cigar burns close to his lips; he spits it out and hesitates.

"I must see her face once," he groans, "my vow notwithstanding;" and as the church clock strikes ten he stands in the black shadow of some trees, looking across a bowling-green at the great doors of the Assembly Rooms, to which heated couples come from time to time to inhale the soft, pure air, and perhaps draw inspiration from the moonlight. At length he sees her, leaning on Captain Hall's arm, and laughing gaily.

A bitter imprecation rises to his lips, but he suppresses it. "Are you content now, stupid?" he asks himself.

A bird twitters on a bough near him, and by force of subtle association, in strange mockery, the recollection comes how he had once startled Maud by a perfect imitation of her dove's cooing; it was when they were most friendly, before Captain Hall's advent.

"It shall be your signal when you want me, and I am talking to disagreeable people," she had said. He wondered whether she would remember the incident, and a wish grew upon him to try the experiment.

They had ceased talking, Maud and her partner, and were gazing straight towards him; but there was safety in the shadow, he knew.

"Coo-o-o!" A soft note, thrice repeated.

He saw Maud start violently, and tremble. Captain Hall thought it was with cold.

"The night air is too chill," he said; "let us return."

"No, I cannot leave the moonlight; but you may fetch my wrapper, if you will be so good."

The watcher beneath the trees saw him vanish; saw Maud's gloved hand pressed to her heart, as though to still its beating. Then he marveled for a moment whether sight were playing him false, for a white figure glided towards him through the moonlight, heedless of the dew that soaked flowing robes and satin slippers.

"Gerald!" it cried.

He drew her into the shadow.

"Say good-by to me, Maud." There was a queer tremor in the voice.

"Good-by?" she asked, wonderingly.

"I leave England to-morrow. Will you not bid me good-by, my lost darling?"

Captain Hall appeared in the doorway at that instant, searching in great astonishment for his partner; but they were happily unconscious of the fact, for two bare arms were around Gerald's neck, and a sweet voice was whispering:

"Love—love—will you not stay, for my sake?"

So it came to pass, that "Gerald Sorthwich, tea-trader, China," remained a myth only.

CULTURE.

There are two theories of self-training, in which people expect to reach that which is fairest and best. One of these is the Christian theory of service for others by faithful labor and self-denial in their behalf; the other is the pagan theory of self-development and careful personal training. The result of the one is a soldierly Christian character; the fruit of the other is "culture."

Far be it from us to say one word against culture as a means to a higher end or as an incident in reaching that end. Culture is one of the finest fruits of mental training. It is that polishing of the mind's machinery which makes it not only run smoothly, but also shine. It is that large acquirement of information, that extended familiarity with the words and ways of men, and that breadth of sympathy with the thoughts and feelings of men, which smooth off the roughness in one's character, which make one tolerant of the notions and peculiarities of other people, and which give a man intelligent and easy companionship with other men.

There is something very attractive about culture, and we hear its praises sounded so much that there is in this stage of our civilization great and increasing danger of its being made an end of pursuit. It sounds well to speak of developing one's powers, enlarging one's sphere of knowledge, acquiring polish, by study, by literary pursuits, by making one's-self a delightful associate. Culture, culture—it is a little god with thousands of young people, who fail to see its essential selfishness.

There is a word, *dilletante*, which has come to us from the Italian, which expresses just a little of the weakness of culture when pursued as an end. It suggests that purposelessness of culture which distinguishes it from the intensity of a manly character that works for an end. A manly man cannot help feeling a healthy contempt for any life which ends only in its own amusement and pleasure, no matter how refined that amusement may be. Cultivation for the sake of culture, sunlight for the sake of sunshine, polishing for the sake of polish—there is something empty and contemptible in the very thought of such a life.

Culture is good, is beautiful; but culture for culture's sake, we say, is contemptible—contemptible because it is utterly selfish, and therefore unworthy. The grand men in the world have been the men of force; the men who have taken hold of other men and lifted them, instead of lifting at their own boot-straps. No man's name goes down to the ages as a name of enthusiasm and power, who has not in him a tremendous will to accomplish something great and good outside of himself. This is the very essence of Christianity, which is godliness. "My Father worketh hitherto, and I work." There is the example of God and Christ, and the grand bidding to the disciple is, "Work while the day lasts." "He went about doing good" is the record of the Master, and "Go work to-day in my vineyard," is His command.—*Interior.*

THE MAZARIN BIBLE.

In answer to many inquiries concerning this famous Bible, we publish the following particulars:

There is a copy in the Lennox Library in this city, which bears this inscription: "The Mazarin Bible, supposed to have been printed by Gutenberg, assisted by Fust, at Mentz (Mayence), 1450-1455. The first printed book known."

Eadies' English Bible, page 105, has the following to say of the Bible under notice: "Gutenberg, or Gousflush, had made some experiments in printing with moveable types prior to 1439. After some delay and loss of money, Fust, a goldsmith, was taken into his confidence, and by his own genius and his partner's financial help, the Latin Bible was printed, toward the close of 1455, in 2 folios of 1,282 pages."

It is known as the Mazarin Bible because the copy of it which first attracted attention in modern times was discovered in the library of Cardinal Mazarin by Dr. Burr.

A copy was sold in 1827 for £504: another at the sale of the Perkins Library; in 1874, brought £3,400.

HOW TO CONSTRUCT A TELEPHONE.

Procure two pieces of tin spouting, about nine inches long. Over one end of each glue parchment, or two thicknesses of very heavy writing-paper pasted together, and dry them near the fire or in the sun; pierce the center of each parchment, when dry, with a pin; then through the hole made, run a piece of fine copper wire, and secure it by means of a cross-piece of heavier wire. Fasten the two pieces of spouting to the wall, or table, or wherever desired, one at either end of the circuit of communication, making them stationary, and leaving the open ends exposed so as to speak into them. Conduct the wire from tin to tin, looping it up at intervals with a twine string, so as to keep it from touching wood or anything that may be a conductor. Draw as tight as possible, and fasten securely at either end.

This, though a home-made telephone, has proved so successful that I can be called from my study, situated in the third story, by any one on the first floor. Through it even a whisper can be heard. The cost is but a trifle.

BRIC-A-BRAC.

HUMAN BUILDERS.

"All are architects of fate
Working in these walls of time,
Some with massive deeds and great,
Some with ornaments of rhyme.

"Nothing useless is and low,
Each thing in its place is best,
And what seems but idle show
Strengthens and supports the rest.

"For the structure that we raise
Time is with materials filled,
Our to-days and yesterdays
Are the blocks with which we build."

[*Longfellow.*

TURKEY AND TRIMMINGS.

A correspondent supplies a curious record of events, which has special interest at the present time. He says:

A century is not much in the life of a nation, and the following dates may be of interest to your readers. From this it appears England has been alternately friends and foes of most of the European powers on the Eastern question:

1740. Austria and Russia agreed to divide Turkey. Great sea fight at Scio.
1770. England and Russia fight Turkey.
1790. Austria and Russia fight against Turkey, and Turkey loses 200,000 men.
1798. England joins Turkey against France, and drives the French out of Egypt.
1807. Russia joins Turkey against England, and almost destroys the English fleet in the Dardanelles, under Sir John Duckworth.
1827. English and Russian fleets destroy the Turkish fleet at Navarino.
1828 Russia fights Turkey, and the "sacred standard" is unfurled.
1833. Russia enters Constantinople, and makes an offensive and defensive alliance with Turkey.
1854. England, France and Turkey subdue Russia in the Crimea.
1877. Russia defeats Turkey, and this time England looks on.

THE REAL AND THE IDEAL.

Not nobler are the hearts that work than hearts that only dream;
For real as the things that are, are all the things tha seem.

The waters gleam among the hills, the mirage on the sands.
And yet alike both image forth the self-same Maker's hands.

We sail along a rocky shore—the cliffs are gray and green.
While in the sunlit depths below as lofty cliffs are seen.

We float upon the waves of Life, with Death at either hand,
And what is false, and what is true, we may not understand;

We see the shadowy rocks beneath, we see the crags above—
How happy are the hearts that know the name of both is Love!

CURIOSITIES OF ENGLISH.

The following are a few amusing examples of the "curiosities of English," as respects the change of sound produced by different consonants.

B makes the road broad, turns the ear to bear, and Tom into tomb.

C makes limb climb, hanged changed, a lever clever, and transports a lover to clover.

D turns a bear to beard, a crow to crowd, and makes anger danger.

F turns lower regions to flower regions.

G changes a son to a song and makes one gone.

H changes eight in height.

K makes now know and eyed keyed.

L transforms a pear into a pearl.

N turns a line into linen, a crow to a crown, and makes one none.

P metamorphoses lumber into plumbor.

S turns even to seven, makes have shave, and word a sword, a pear a spear, makes slaughter of laughter, and curiously changes "having a hoe" to "shaving a shoe."

T makes a bough bought, turns here there, alters one to tone, changes ether to tether, and transforms the phrase, "allow his own" to "tallow this town."

W does well; e. g., hose are whose, are becomes ware, on won, omen women, so sow, vie view; it makes an arm warm, and turns a hat into—what?

Y turns fur to fury, a man to many, to to toy, rub to ruby, ours to yours, a lad to a lady.

Here nestles little Jim,
A measle wrestled him
And mortified his tiny little system;
Then other measles followed,
Much medicine he swallowed,
And that is how it happened that we missed 'im.

[*Philadelphia Ledger.*

In Paris society was much exercised in its mind as to the etiquette which would decide the choice of a partner for the Prince of Wales in the cotillion at Lord Lyon's ball—whether the lady of the highest rank (of course it could be no other) would be selected from English or French claimants to that dignity. His royal highness, however, settled the question, by leading out an American young lady (Miss Yznaga), and society has not yet recovered the shock.

What a beautiful example of simplicity in dress is shown some of the followers of fashion by that domestic animal, the cat, which rises in the morning, washes its face with its right hand, gives its tail three jerks, and is ready dressed for the day!

Politeness is like an air cushion. There may be nothing solid in it, but it eases jolts wonderfully.

For Women.

CONDUCTED BY MISS FAITH RIPLEY.

CHOOSING THE RING.

I looked at an amethyst first, dear—
'T was so like your violet eyes,
Dreamy and soft, yet deep and clear,
The very hue of the skies
When dark clouds part, and the steadfast blue
Looks down on the storms below;
For a faith that is tender and tried and true
The tints of the amethyst show.

And then the sunlight suddenly streamed
On a mammoth topaz there;
Liquid gold, it glistened and gleamed
Like the amber glint of your hair.
And Hope, glad hope, was the word I read,
As in whirl of a sunny curl,
But the ring was far too large, and I said,
Not this for my little girl.

'T was a ruby stone that I looked at next,
It glowed like my own heart, dear;
And I poised it a moment, half perplexed,
For I felt your read lips near!
Love, love, I read in its burning rim,
And yet—can you tell me why?—
The color grew suddenly cold and dim,
And I passed the ruby by.

It was only the *diamond's* flash revealed
Blue, gold and crimson in one!
Ay! *faith, hope, love*—all lie concealed
In this magical matchless stone,
Where amethyst, topaz and ruby fling
Into one the glory of three.
And so it was that I chose the ring
My darling must wear for me. [*Transcript.*

WOMEN PHILANTHROPISTS.

Who has not heard of worthy Mrs. Fry, the Quakeress, who led the van in the noble work of reforming both prisoners and prisons?—a work so ably carried on by Mary Carpenter, who extended her philanthropic efforts to India, in the interests of education and prison discipline. Elizabeth Fry, surnamed "the Female Howard," was a daughter of John Gurney, of Earlham, and sister to Joseph John Gurney and Lady Buxton. She began to preach in 1810, and three years later commenced her work as a prison reformer. She effected much improvement in Newgate, and in parts of the United Kindom, and then she proceeded on a mission to the Continent, which occupied her during several years. She died at Ramsgate in 1855, having been the mother of a large family. Mary Carpenter comes next on our list—the friend of the miserable and out-cast—who labored not only for their reform in England, but, as we have remarked, in India likewise. Three times she visited that country, and on her return from her first visit, in 1866, she published two volumes on the subject. She took part in the conferences at Birmingham in 1851-52-53, and was called upon to give evidence to the committee of the House of Commons which in 1852-53, inquired into the condition of criminal and destitute children. Miss Carpenter was born in 1807, at Exeter, the daughter of a Unatarian minister, and died on the 16th of June last year. Her decease took place in the "Red Lodge Reformatory," which she had herself instituted, and where she had labored many years. The third great female philanthropist was Caroline Chisholm, the daughter of a well-to-do yeoman in Northamtonshire, a good and actively benevolent man. Her mother, early a widow, gave her an exceptionally thorough education, turned well to account, in after life. Having married Christian Chisholm of her Majesty's Indian Army, she went out to Madras, where she founded the "School of Industry" for the daughters of soldiers; in which rudimentary instruction of many kinds is still being given, including those of the various duties connected with the household. She was little more than twenty when she opened the school, and in 1839 she and her husband removed to Australia and settled at Sydney. There she established a home for the protection of young girls, whose peril was great on landing in a new and very rough country—as it was some thirty or forty years ago. Expeditions into the country were then undertaken by this brave and generous woman, for the purpose of escorting sometimes as many as eighty young women, to be left here and there in the scattered farm-houses, paying all expenses herself. On one occasion she took in charge the whole emigrant importation from one ship, consisting of sixty-four girls, possessing but fourteen shillings between them. Paying for all, she took them up the country, and in two years they were nearly all married, and, thanks to her selection of homes, all had preserved good characters. But her work did not end here; she opened a money-market for immigration at Sydney, and advanced no less than £10,000 of which she lost but £10 in return for her generous confidence. At last after much up-hill labor, the colonists began to subscribe to her work. Through the Colonial Secretary, she induced the English Government to send out the wives and families of "ticket-of-leave," convicts. One shipful, collected from most of the unions in the country, she brought out in person. She also effected important reforms in the regulation of emigrant ships. On one occasion of her leaving, the colonists presented their benefactor with a purse of money and an address; and her invaluable work was publicly acknowledged both by Lord Derby and Mr. Lowe, both ministers of the Crown. The valuable life of this exemplary woman terminated March 25, 1877.

SLURS ON WOMEN.

Of all evils prevalent among young men, we know of none more blighting in its moral effects than to speak lightly of the virtues of women. Nor is there anything in which young men are so thoroughly mistaken as the low estimate they form as to the integrity of women. Not of their own mothers and sisters, but of others, who, they forget, are somebody else's mothers and sisters. As a rule, no person who surrenders to this debasing habit is to be trusted with an enterprise requiring integrity of character. Plain words should be spoken on this point, for the evil is a general one, and deep-rooted. If young men are sometimes thrown into the society of thoughtless or depraved women, they have no more right to measure all other women by what they see of these, than they have to estimate the character of honest and respectable citizens by the developments of crime in our police courts. Let our young men remember that their chief happiness in life depends upon their utter faith in women. No worldly wisdom, no misanthropic philosophy, no generalization, can cover or weaken truth. It stands like the record of itself—for it is nothing less than this—and should put an everlasting seal upon lips that are wont to speak slightingly of women.

UTILIZING USELESS WOMEN.

A NEWSPAPER so seldom speaks in a sensible way of women, that the following article is worth noticing, from the Ogdensburg (N. Y.) Daily Journal:

In 1866, a cargo of women, numbering 150, left New York for Oregon, arrived there safely, and a letter recently received, says they all found homes and husbands, and have passed happy lives. It is said there are 100,000 bachelors now on the Pacific coast wanting wives, and a similar enterprise might prove equally successful.—Exchange.

Very likely; but the average of women are no longer willing to be shipped as "cargoes" to search for husbands upon the Pacific coast. They would gather their robes closely about their fair proportions and trip indignantly away at such a suggestion. Women, like men, have their representatives. Years ago they sought service with the foreign missionary societies, and were content to go out and spread the gospel net, to catch the shirtless and unsuspecting heathen. Now, one representative woman is an applicant for a first-class foreign mission under the general government, and she would like to know "how long, O Lord, how long," it will be before she can have a white man's chance to live in a palace in a foreign capital under the Old Flag, as a representative of her darling native land.

The aspiration is a natural one. We do not know why the chin of a woman might not wag as successfully in diplomacy as that of an antediluvian scare-crow like Caleb Cushing. But the tracery of green and the bursting buds upon the trees are likely to mark the advent of many a spring-time, we fear, before the hope will be realized. This perverse world moves but slowly, and with many a groan, perplexing hitch, and endless creaking, as it makes progress. The Methodists decided in their conference lately held in New York City, that women could not preach the Gospel. We are in favor of enlarging the suffrage, admitting women to the pulpit, sending them abroad as diplomats, and terminating the pitiful littleness of a policy that would restrain a woman from being a policeman or a statesman.

WHAT A QUEEN COSTS.

The Amount Englishmen are Taxed to suppor the Royal Establishment.

When Queen Victoria came to the throne in 1837, the usual steps were taken to provide for the support of her Majesty and the royal household. A select committee of twenty-one members was appointed by the House of Commons to prepare estimates for such support. For her Majesty's privy purse they set apart $300,000 yearly; for household salaries, $656,500; for ordinary household expenses, $362,500; for royal bounty, etc., $66,000; and for various other small items, $40,200. The total is about $1,925,000. The estimate was agreed to by the House of Commons, and so the account stands to-day. Some of the offices for which provision was made in that list have since become obsolete, and the incumbents have absolutely no duties to perform. Yet the offices are still filled and the salaries are still paid as before.

These items by no means constitute the whole expense of the Queen's household, and that lump sum of $1,925,000 is by no means her whole income from the National Treasury. She also receives the revenues of the Duchy of Lancaster which amount to $215,000 net. The amount from this source is not uniform, but that was the sum received for the last year reported—1876-77. This swells her Majesty's privy purse to $515,000 per annum out of the funds of the nation. On this sum she has absolutely no demands for her actual ordinary expenses. It is clear pocket money. She is under no necessity of laying out a single penny of it, for every possible expense seems to be provided for in other allowances. If she travels by water, a yacht is placed at her disposal at government expense. If she travels by rail, the country, likewise, foots the bill by an additional allowance. Even for charity she need not draw upon her own purse, for a liberal grant is made for this express purpose. Not only does she travel by water in royal yachts but a small fleet of these yachts is built and kept in repair for her particular use. This, of itself, is an enormous extra bill, but I have no means of finding the amount of it. The maintenance of royal palaces takes an additional $157,900 a year, and the maintenance of royal parks and pleasure gardens takes another $529,655 per annum.

Adding the annual allowance to her Majesty, the net revenues of the Duchy of Lancaster and the maintenance of royal palaces, parks and pleasure gardens, we have a total of $2,827,555 a year. This does not include the traveling expenses of the Queen, the maintenance of the royal yachts, or any of the half a dozen other important items which are strictly a part of the expenses of royalty in England. Allowances to other members of the royal family are also additional items. "In fact," as an English authority says, "if all the expenses incidental to 'the honor and dignity of the Crown' could be ascertained, it would be found that the $1,925,000 annually settled by Parliament upon her Majesty, constitutes but a very small portion of the actual cost of royalty.

It would be wrong to blame the Queen individually with any great part of the responsibility of her absurd and expensive household. It is a creature of the British aristocracy as a whole, and the Queen is only a kind of central figure of the system which the country has built. I may add that the Queen also has a large private fortune, from which it is estimated she realizes an income of no less that $1,000,000 a year, in addition to the amount paid her by the nation.

The allowances to the Royal Family, not including the Queen, amount to $785,000 yearly. The revenue of the Prince of Wales from the Duchy of Cornwall—about $350,000 annually—is not included in this sum. Summing up the leading items of the cost of royalty in England, we have a total of $3,964,430. If all the items could be ascertained, I do not doubt that the total given would be found to be not more than one-half the direct annual cost of royalty in England.

The London Times takes as manly and wise a view of woman's education as does the Examiner. "However opposed," it says, "men's views may be on the advantage to the world of the free competition of the women in the labor market, few would question the advantage of improving the quality of women's education. Nothing less well adapted than the kind of training hitherto provided for girls to fit them, keeping strictly within their own limits, to be useful companions of men, can well be conceived. Women will not have done much toward 'intellectual freedom' if they merely superimpose a boy's Latin and Greek on a girl's pianoforte and embroidery. What is required to give women 'intellectual freedom' is, not to increase the range of study, but to deepen it. Music, Italian, drawing and the use of the globes may be taught in such a way as to cultivate the whole intellect: and Latin, Greek and the higher mathematics may be learned with the result merely of creating female pedants. The 'higher education of women,' when it is fully developed, will, if it be really worth the name, make women not less, but more womanly. Even so there may be plenty of scope for a certain admixture of women in the liberal professions without changing the relations of society and setting sex against sex. * * * * It is not so much a higher education as a deeper and more thorough education that is needed. Let women be thoroughly taught whatever they have to learn, whether it be much or little, and they will thereby be fitted, as occasion calls, to take up any occupation that may be open to them with application, thoroughness and efficiency."

WOMAN'S SPHERE.

Why does it follow that women are fitted for nothing but the cares of domestic life? for bearing children and cooking the food of a family? devoting all their time to the domestic circle—to promoting the immediate personal comforts of their husbands, brothers and sons? I admit that it is their duty to do these things. But I say that the correct principle is that women are not only justified, but exhibit the most exalted virtue when they depart from the domestic circle and enter on the concerns of their country, of humanity, of their God. The mere departure of women from the duties of the domestic circle, far from being a reproach to them, is a virtue of the highest order when it is done from purity of motive, by apropriate means and toward a virtuous purpose. And I say that woman, by the discharge of such duties, has manifested a virtue which is even above the virtues of mankind and approaches to a superior nature. That is the principle I maintain; and I hold it to be proof of pure patriotism, of sincere piety and of every virtue that can adorn the female character.—*John Quincy Adams.*

FEMALE EDUCATION.—In the days of Queen Anne the education of woman, as we understand the term, was very much neglected. The daughter of a country gentleman was taught the duties of a cook; sometimes, also, if the parents were ambitious that she should shine in after-life as an accomplished hostess, she received lessons from a carving-master. The cardinal duty of hospitality, as she heard it inculcated at home, was for the lady to press the guests to repletion; while it was the province of the master of the house to make them drink to excess. This, perhaps, was a fitting education for a young woman who was to become the helpmate of a rude landlord, who regarded a wife as an upper servant, and who thought the company of a woman an irksome restraint upon the freedom of social intercourse. To a woman of any education and refinement, an English manor-house, during at least the earlier days of the Hanoverian succession, must have been an intolerable home.

THE ROSE OF JERICHO.—The so-called Rose of Sharon is one of the most exquisite flowers in shape and hue. Its blossoms are bell-shaped, and of many mingled hues and dyes. But its history is legendary and romantic in the highest degree. In the East, throughout Syria, Judea, and Arabia, it is regarded with the profoundest reverence. The leaves that encircle the round blossoms, dry and close together when the seasons of blossoms are over, and the stalk withers completely away at last from the bush on which it grew, having dried in the shape of a ball, which is carried by the breeze to great distances. In this way it is borne over the waste and sandy deserts, until at last, touching some moist place, it clings to the soil, where it immediately takes fresh root and springs to life and beauty again. For this reason the Orientals have adopted it as the emblem of the Resurrection.

Implements and Machinery.

Halladay Standard.

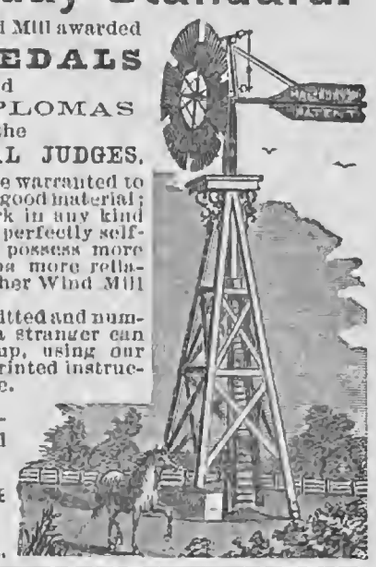
The only Wind Mill awarded
TWO MEDALS
and
TWO DIPLOMAS
by the
CENTENNIAL JUDGES.

Every machine warranted to be well made of good material; to do good work in any kind of wind; to be perfectly self-regulating; to possess more power and to be more reliable than any other Wind Mill made.

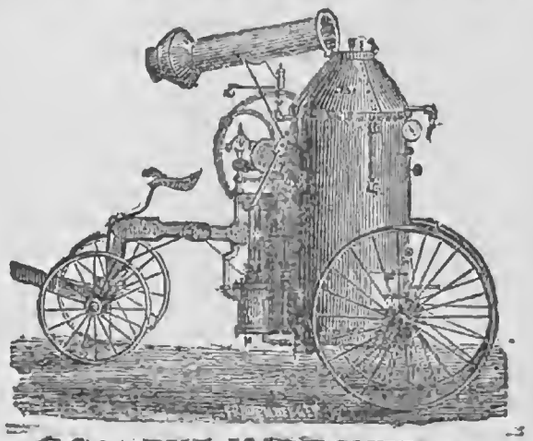
Each piece is fitted and numbered so that a stranger can put the Mill up, using our drawings and printed instructions for a guide.

Send for Catalogue "B" and Price List.

U. S. WIND ENGINE & PUMP CO.,
BATAVIA, ILL.



CANTON MONITOR ENGINE.



THE IMPROVED SWEEPSTAKES THRESHER

MADE BY

C. AULTMAN & Co.
CANTON, O.

Send to the Company for Descriptive Circular.

THE SILVER & DEMING
Endless Chain Horse Powers

For 1, 2 and 3 horses, are the best made.

They have steel track rods, wrought-iron links, and for strength and durability are unsurpassed.

Our Improved Governor regulates the speed perfectly.

We also manufacture Drag and Circular Sawing Machines. Send for Circular.

SILVER & DEMING MF'G CO., Salem, Ohio.

THE SILVER & DEMING FEED CUTTER
HAS NO SUPERIOR IN THE MARKET.

Celebrated for its great capacity, ease of running, and its adaptability to all kinds of work. Our Power Cutters are fitted with an **Improved Safety Fly Wheel**, and in the event of iron or other hard substances getting into the feed, the Fly Wheel revolves, but the knives stop, thereby securing safety to the machine and to the operator. Send for Circular giving Prices and full Particulars.

SILVER & DEMING MF'G CO., Salem, O.

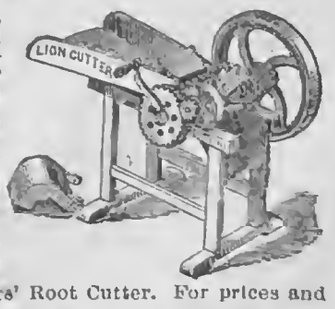
BIG GIANT CORN MILL.
Every Man His Own Miller.

The only Mill that will grind Corn with Shuck on without extra expense. The only Mill grinding Corn and Cob successfully that will grind Shelled Corn fine enough for family use.

Grinds twice as fast as any other Mill of same size and price. Manufactured by

J. A. FIELD, SON & CO.
922 N. 2d St., St. Louis.

The Lion Feed Cutter



This is one of the most popular Feed Cutters in the market. We also make Gale's Junior and the old Self-Sharpening Feed Cutters—two well-known and highly approved Cylinder Cutters. Also Gale's Lever Cutter, the leading Lever Cutter now made. We also manufacture Gale's Vegetable or Root Cutter, besides Farmers' Root Cutter. For prices and terms, address

THE BELCHER & TAYLOR AG'L TOOL CO.,
Chicopee Falls, Mass., U. S. A.

Matthews' Garden Seed Drill,
Matthews' Hand Cultivator,

Matthews' Drill & Cultivator combined, surpass all others. Send for Circular before you buy.

Manufactured only by
EVERETT & SMALL,
Boston, Mass.

Domestic Economy.

CONDUCTED BY EMILY MAPLE

FEMALE BORROWERS.

MRS. A. E. STORY.

"Neither a borrower nor a lender be."

DOES it ever enter into the mind of the woman who complains of the borrowing propensities of her neighbors that the lenders are themselves in a great measure responsible for the borrowing? Certain it is that borrowers would soon "cease from the land" if there were no one found to encourage the thriftless habit. The habit of borrowing grows upon one as habits generally do, whether good or bad, and the woman who begins by borrowing an occasional drawing of tea, or a bank of thread, will soon ask you for your latest magazine, and that before the leaves are hardly cut, or your best tablecloth when she has "company," as cooly as though she thought you must feel it a privilege to lend them. *Her* tablecloths are always "in the wash" at such times. She is always forgetting to send to the store for tea, sugar, starch, and a dozen other such things, and the reason she forgets is, she knows you have them and will lend them to her.

If her aunt's cousin is going to be married and she is going to the wedding, she is sure not to have time to get ready for so grand and particular an occasion, and so you are asked to ransack your boxes and drawers for something that will set off her old dress and make her a fitting wedding guest. She will remind you while you are doing this, that her complexion and style of features are peculiar, and that only certain things—which she mentions, and which she knows you possess—will become her.

You have been years, it may be, getting the conveniences of housekeeping about you, and your neighbor who has been too slack or thriftless to do the same for herself, uses them. She lets her tub fall to pieces in the sun and then does her washing in yours. She runs her candles in your molds, twists her stocking yarn on the wheel your grandmother left you, sifts her pumpkins through your colander, and grinds her spices in your mill, and you may count yourself fortunate if, when these things are wanted by yourself, you do not have to go after them.

"Please, ma'am will you lend ma a little salve? Tommy has cut his thumb."

"Mother would like to borrow a little kerosene, if you have it to spare."

"Pa has lamed his back so he can't work, and ma wants him to read to her; could you lend him a paper?"

"We want to go visiting this afternoon, and would you please let us take the baby's carriage?"

This is the way you are pestered, almost daily, if you belong to the great army of lenders and are so unfortunate as to live next neighbor to a chronic borrower. You bear it with a meek submissiveness that has become habitual with you, until Mrs. Slack comes in some day and requests the loan of your switch, as she is going West on a visit to her dear mother, and her hair—which is getting thin—"couldn't have been nearer the color of yours if it had all grown on one head," and "while she is there and thinks of it, she will take a fine-tooth comb, if you have one handy."

An ominous flush leaps into your face at this, and your neighbor goes home empty-handed, doubtless to call you the meanest woman alive, but she comes back next morning for your traveling bag and you lend it, thankful that the woman has a mother out West, and hoping that her visit will be a long one.

Now some of these troublesome people will read this article. They will borrow the paper to read it, and so sponge both on the publisher and the subscriber who has paid for it, and unless the heading should provoke their ire, as suggesting something "personal," they will want to see whether some woman *they* know of "catches it."

My dear friend, if *you* are a *habitual* borrower, this is for you. Don't you know that the tea you get of your neighbor is better than what you send back? Don't you know that you don't always return *quite* as much as you get? And don't you know, too, that it is possible for the neighbor to get out of tea while she is waiting for you to pay what you owe her? And don't you sometimes forget to pay it at all? Don't you know that you burn her brass kettle every time you have it to "make up your preserves?" and that you dull the knives of the sausage-grinder and then fail to sharpen them? Have you never thought what trouble you cause your neighbor when you oblige her to send to your house for the flat-irons every time she wants to use them? And has it never occurred to you that you are doing her an injury, not only in the wearing out of the various conveniences which her forethought has provided, but in appropriating to your own service time which belongs to her and to her family, and to which you have no manner of right?

TO MEND BROKEN CROCKERY.

WE have used lime and the white of an egg for mending earthenware, and find it most satisfactory. It is a strong cement, easily applied, and generally at hand. Mix only enough to mend one article at a time, as it soon hardens when it cannot be used. Powder a small quantity of the lime, and mix to a paste with the white. Apply quickly to the edges, and place firmly together. It will soon become set and strong, seldom breaking in the same place again.

Iowa. E. A.

News of the Week.

Monday, June 24, 1878.

SHORTLY after 7 o'clock on Thurday morning Congress adjourned, after having twice deferred the day for doing so, on account of the impossibility of passing the numerous necessary bills—chiefly financial—which had been put off to the last moment. This press of business towards the end of each session is invariable, and although it notoriously affords a flagrant opportunity for the undetected passage of private bills of a jobbing character, the lessons of the past are never enough to teach our legislators the advisability of avoiding the necessity for this final rush, by passing the needed bills at an earlier date in the session. The bill for paying to Canada the Fisheries Award of five and a half million dollars was passed by both Houses; that for paying the expenses of the second batch of "visiting statesmen" sent by Hayes to Louisiana, though amounting to only $6,000 was defeated in the Senate, Conkling and Blaine bitterly denouncing the "statesmen" for having brought about the defeat of Packard, whose title to the governorship of that State they claimed to be as valid as that of Hayes to the presidency. Hayes says he will foot the bill, if his hopes that next Congress will pay it, are disappointed. The democratic majority of the House Committee on Naval Affairs claim to have discovered such culpable extravagance in the purchases and sales made by ex-Secretary Robeson, that they recommend the criminal prosecution of that ex-official and of other accused parties. A bill has been passed authorizing the sale of 4 per cent. bonds for legal tender notes, and making the latter receivable for import duties after October the first. Gold has hitherto been required for both these purposes, and the effect of the bill will be to relieve the pressure on the gold market, caused by the large demand for gold for the above purposes, and also to force the United States to purchase about $100,000,000 of gold each year to pay the specie interest on its indebtedness.

After the adjournment of Congress the Louisiana Investigating Committee resumed its sessions, temporarily interrupted by the necessity for the presence of its members at the regular sessions of the House. The Senate Committee to investigate Senator Mathews' connection with the Louisiana frauds, has temporarily collapsed on account of Anderson's refusal to testify unless represented by counsel. As the Senate had adjourned, the committee had no power to punish his refusal, and accordingly adjourned indefinitely. Mathews has, at last, offered to appear before the House Committee. A Captain Jenks—famous, not for ballad notoriety, but as being the husband of Mrs. Jenks—was the first witness examined. He contradicted Anderson's evidence in several particulars, but refused obstinately to remember anything in connection with the celebrated Sherman letter, or the motives of his wife's travels or conduct. The impression conveyed by a perusal of his lengthy evidence, is by no means calculated to beget faith in his veracity. On the following day, Saturday, Mrs. Jenks enlivened the witness-stand, and for five hours both amused and startled her audience. At the end of that time, though fresh and sprightly herself, she had wearied her examiners—Ben. Butler and McMahon—showed Anderson to have all along been her dupe, and exhonorated Secretary Sherman from having had any connection with the famous document known as his letter. That production, she said in substance, was her own, though to avoid the accusation of forgery, she gave it to be understood that she merely dictated it; and palmed it off on Weber and Anderson as the inculpating production of Sherman.

She was commissioned by Weber to take to Sherman the joint note of Anderson and himself asking a written guarantee that both should be taken care of. Not finding that visiting statesman and having opened the letter of the tricksters, she concocted the famous missive, and handed it to Weber as coming from Sherman. Several letters of hers contradicting other parts of her evidence were read without at all disconcerting her, yet these contradictions weaken not a little her entire testimony. A sub-committee of two democrats and one republican, is about to visit Louisiana to take further evidence on the spot, and the main committee will have their hands full at Washington for some time yet.

Elections have just been held in California for members of a convention to frame a new constitution for that State. The workingmen's party, called Kearneyites, after their leader, Kearney, a San Francisco demagogue, has secured a majority in the Assembly, mainly through divisions among their opponents. The regular republicans and democrats put their respective tickets in the field, and a third ticket gotten up mainly by capitalists and called the "No-partisan ticket," drew away a large number of votes from the regular nominees, so that owing to this rivalry, the Kearneyites proved triumphant. War will probably now be made on Chinese immigration. Heavy rains, floods, and great destruction of crops in southern Kansas. Reports of Indian hostilities growing thicker; rumors, probably false, of threatened outbreaks on the western borders of Minnesota and Wisconsin. Col. McKenzie's force has returned to Texas from Mexico, without having met an enemy, but after having greatly exasperated the natives. Tramps are perpetrating outrages and murders in different parts of the country.

Railway Threshing Machine proved itself the "Best at Centennial Trial," and was the only Machine awarded a

CENTENNIAL MEDAL

AND CERTIFICATE OF MERIT,

On both Horse Power and Thresher and Cleaner, at the Centennial Exhibition, as shown by Official Report, which says: "*For special features in the Power to secure light running and minimum friction. For the ingenious form of the Straw Shakers, which insure the proper agitation to separate the grain from the straw.*" For catalogue, address MINARD HARDER, Cobleskill, Schoharie County, N. Y.

TRADE MARK. 'VIBRATOR' Reg. March 31, 1874.

THE ORIGINAL & ONLY GENUINE

"Vibrator" Threshers,

WITH IMPROVED

MOUNTED HORSE POWERS,

And Steam Thresher Engines,

Made only by

NICHOLS, SHEPARD & CO.,

BATTLE CREEK, MICH.

THE Matchless Grain-Saving, Time-Saving, and Money-Saving Threshers of this day and generation. Beyond all Rivalry for Rapid Work, Perfect Cleaning, and for Saving Grain from Wastage.

GRAIN Raisers will not Submit to the enormous wastage of Grain & the inferior work done by the other machines, when once posted on the difference.

THE ENTIRE Threshing Expenses (and often 3 to 5 Times that amount) can be made by the Extra Grain SAVED by these Improved Machines.

NO Revolving Shafts Inside the Separator. Entirely free from Beaters, Pickers, Raddles, and all such time-wasting and grain-wasting complications. Perfectly adapted to all Kinds and Conditions of Grain, Wet or Dry, Long or Short, Headed or Bound.

NOT only Vastly Superior for Wheat, Oats, Barley, Rye, and like Grains, but the ONLY Successful Thresher in Flax, Timothy, Millet, Clover, and like Seeds. Requires no "attachments" or "rebuilding" to change from Grain to Seeds.

MARVELOUS for Simplicity of Parts, using less than one-half the usual Belts and Gears. Makes no Litterings or Scatterings.

FOUR Sizes of Separators Made, ranging from Six to Twelve Horse size, and two styles of Mounted Horse Powers to match.

STEAM Power Threshers a Specialty. A special size Separator made expressly for Steam Power.

OUR Unrivaled Steam Thresher Engines, with Valuable Improvements and Distinctive Features, far beyond any other make or kind.

IN Thorough Workmanship, Elegant Finish, Perfection of Parts, Completeness of Equipment, etc., our "VIBRATOR" Thresher Outfits are Incomparable.

FOR Particulars, call on our Dealers or write to us for Illustrated Circular, which we mail free.

The Rectangular Churn

Simple, efficient and *always reliable*. No inside fixtures. Fifty per cent. in labor saved over *any other churn*. Five sizes made. Twenty Thousand in actual use, and indorsed by leading Dairymen in every State. *Cheap*, and warranted to be exactly as represented.

CORNISH & CURTIS, Fort Atkinson, Wisconsin, U. S. A.

RALPH'S ONEIDA CHEESE VAT.

For Single Dairies and Small Factories. Send for Circular and full description to

JONES, FAULKNER & CO., Sole Manufacturers, Utica, N. Y.,

Dealers in Dairy Supplies and Furnishing Goods. Also, Manufacturers of Steam Boilers and Engines and STEAM DAIRY APPARATUS, for Cheese Factories and Creameries.

HIGH-CLASS POULTRY.

Kirby Homestead, Charlton, Saratoga Co., N. Y.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, June 22, 1878.

BEANS AND PEAS.—In beans there is neither local nor export demand of moment. Abundant summer produce diminishes the former trade, and there is nothing to stimulate wholesale transactions in the latter. The totals noted for export during the past fortnight do not include much new business. Quotations for all standard sorts are extreme, and during the week buyers have been favored in quality when paying even the under rates. Canadian field peas in bulk and bond quiet at 78½c. Green peas have a fair call for warm weather at $1.05@1.10. Southern B.E. per 2 bush. bag, $3@3.25.

We quote medium beans, prime, $1 87½@1 90; fair to good, $1 35@1 50; marrows, prime, free on board ship, $1 57½; fair to good, $1 40@1 50; Pea, $1 40@1 65; white kidney, $1 40@1 60; red do., $2 50@2 90; black, $2 35@2 40; Lima, $3.75@4.25.

Receipts of beans past week, 6,428 bush. Exports of beans, 107 bbls. Exports of peas, 1,700 bush.

BEESWAX.—There is only a trading in small lots, at from 26½@27½c. for Western and Southern.

BROOM CORN.—The dealings are limited to small lots. Quoted at 6@7c. for hurl and short brush; 5@6c. for medium green, and 4@4½c. for red and red-tipped, per lb.

BUTTER.—There are no new features; sellers sole aim has been to keep down the supplies, they have allowed prices to take care of themselves. This system, of course, has not tended to improve quotations. Still, stock has been kept moving, and dealers are gratified with gaining such a point against the very free deliveries of this prolific season. We are glad to see Orange Co. pails and fine river do. rallying to something of their old-time firmness, as it reminds one of the prosperous days when boatmen *would* have their say. Creameries have been for a long time formidably antagonistic to the fine, rich churn product of Orange Co., Sussex Co. and other dairy points near this city. But now, since State and Western creamery are down to prices that let exporters in, barge captains begin to see the faces of old local customers more frequently. Western cheap table grades have not had a steady movement. Fine dairy packages have led the market demand. Milled stock and some factory have frequently turned out so poor of late, that much of the offering is condemned. Some of these lots are needlessly pushed aside, but, as we have before intimated, with a high standard of State, and the low scale of prices, it is difficult to entice buyers to other parcels that require much investigation, or whose cheapness seems to imply risk of quality.

State creamery, choice, 19@20c.; other, 16@18c.; half tubs and pails, choice, 17@19c.; other, 12@15c.; Welsh tubs, best, 16@17c.; other, 12@16c.; poor State, 6@8c.; State firkins, 15@17c.; Western creamery, choice, 19@20c.; other, 16@18c.; Western dairy, best, 12@14c.; other, 9@10c.; factory (ladle packed), 10@11c.; other, 9@10c.; milled Western, 5@9c.; old and grease, 3½@5c.

Receipts for the week, 30,652 pkgs.; exports past week, 8,274 do.

CHEESE—The choice colored factories have held well up this week. Sales not deviating from the basis of 8¾ established early in the week, but there has been an excess of white stock, which, after opening fairly steady, was salable only at yielding figures. The latest prices for these are 8 for fancy, and 7¾@7¾ for very good and prime lots. The arrivals have been very large, and with the warm weather the position has been thrown in the buyers favor. Shippers have taken liberal quantities, and the assortments of the upper grades are pretty well cleared out.

Latest prices for factories are: Fancy, 8@8¾c.; 7½@8c. for good and prime; 6½@7c. for fair; 4½@6¼c. for half skimmed; 2@3½c. for skimmed. State, farm dairy at 6¾@7¾c. for good to choice, 5@6½c. for fair to good and 2@3c. for poor skimmed. Wisconsin factory, fine to fancy, 7¾@8¼c.; do. good to prime, 7@7¾c.; do. fair, to good, 6¾@6¾c.; Western factory, fine, full cream, cheddar, 7¾@7¾c.; do. fine, full cream, flat, 7@7¾c; do. slightly skimmed, flat, 5½@6¾c.; do. half skimmed, 4@5¾c.; do. full skimmed, 2¼@3¼c.

Receipts for the week, 120,300 boxes.
Exports, past week 121,907 boxes.
Gold closes at 100¾.
Liverpool cable quotation, 45s. 6d.

COTTON.—There has been a good, strong market most of the week. Latest prices are: 11.50@11.51c., for June; 11 51@11.52c., for July; 11.53@11.54c., for August; 11.21c. for September.; 11.02@11.03c., for October; 10.89@10 90c., for November; 10 89@10.90c. for December; 10.93@10.95c. for January; 11 01@11.03c. for February; 11.00@11.13c. for March; 11.20@11.22c. for April; and 11.23@11.30c. for May.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted:

Good ordinary..9 7-16c.; Strict good ordinary.10 7-16c.
Low middling..9 15-16c.; Middling .....11 5-16c.

DRIED FRUITS.—Nothing new transpires in this connection. The lull in trade is incident to this season of the year when fresh fruits are plenty. Low prices do not help matters at all; apples especially depressed.

Peaches—Fancy North Carolina 10@11c.; Choice Georgia, 10c.; good to prime Georgia; 8@9c.; evaporated, 25@28c.; unpeeled halves, 3¾@4½c.; quarters, 3¾@4c.; unpeeled evaporated, 7½@8c. Pitted cherries, choice new, 19@20c.; Raspberries, 26c. New York State plums, 11c.; Southern plums, 9@10c. Blackberries at 10½c. Apples—State quarters, 4@4¾c.; do sliced, prime, 4½@5c.; good, 4@4½c.; Western quarters, 3@3¾c.; Southern at 4½@5c. for prime sliced; 3¾@4½c. for fair to good; Southern quarters, 3@3¾c.; Tennessee quarters, in bags, at 2½@3.

EGGS.—Receipts for the week, 10,156 bbls.; do last week, 8,310 do. The market has lost some of its hardiness in prices, but sellers do not apprehend a severe decline, as the weather has turned favorable for increased sales. Few near points arrive.

Near points, 16@17c.; State and Penn., 15@16½c.; choice Western and Canadian, 14@16c.; a few off quality lots, 13@13½c. Sales all loss off.

FRESH FRUITS.—We seldom report so extended a list at this date of June. Strawberries have a fair sale, but they lose some trade through the mixed purchasers of the period. New Jerseys are out, but the river counties and convenient interior railroad points furnish an ample supply. Up River 3d, quarts, 3@4c.; Oswego and Oneida, 8@11c. Southern peaches are in good supply. Some crates are extra in quality, and another long season of choice fruit is promised by the enterprise of Southern growers. Choice Geo., bush., $4@5; other, 2@2.50; S. C., $1.75@2.50, Choice N. C., $3@4; other, $1.50@2. State cherries are abundant, and the short neighboring crop is not felt commercially. Fancy, 10@11c.; fair 10 prime, 5@9c.; sour, 8@10c. Watermelons are in large supply, but very much in advance of the demand. $20@30 per 100.

FLOUR.—There have been pretty full supplies and not much activity, with prices easier and closing weak.

Latest prices are $3.15@3.90 for very inferior to very choice superfine State; $4.00@4.30 for very poor to very good extra do. odd lots and lines; $4.30@4.65 for good to fancy do.; $3.25@3.85 for very poor to very choice superfine Indiana, Iowa, Michigan, Ohio, &c., $4.00@4.35 for inferior to very good shipping extra do. and $4 30@4.65 for very good to very choice extra do.; common to about choice white wheat extras, $4.40@5.50; choice to very fancy do. at $5.60@6.75; red and amber winter wheat, inferior to very choice trade and family at $4.35@5.85; round hoop Ohio at $4.10@4.10, and trade and family brands of do. at $4.50@$5.85, the latter rate for choice, (very choice to fancy lots quoted higher); St. Louis, $4.35@5.15 for very poor to good extra, and $5.15@6.50 for good to very choice, with a few brands of fancy quality quoted up to $6.75@7.00; Minnesota clear, very in-

ferior to very choice at $4.25@5.75; Minnesota "straight," inferior to fancy, at $5.25@6.50, and patent poor to fancy at $5.50@8.00; unsound stock at from $2.00@5.00; city mill extra at $5 20@5.45 for fair to fancy for West Indies; do. for England, $4.10@4.25; do. trade and family extras, $6.00@7.25; do. for South America, $5.60@6.25 for fair to choice; No. 2 $2.15@3.00 for inferior to very fancy.

CORN MEAL.—Is selling at $2.30 for Brandywine, and $2 15@2.35 for Western yellow.

GRAIN.—The receipts here have been very small and the movement at the lake ports light, but from most sections comes good reports in regard to the crops, and prices have been in consequence declining.

Latest sales of wheat are of ungraded white western at $1.18; white State at $1.21½; extra white, at $1.24; No. 2 red at $1.14; ungraded red at $1.11 to $1.14; rejected red a. 9ic.; No. 1 Minnesota spring at $1.11; No. 2 spring at $1.06@1.07½; No. 2 red, June option, at $1.14¼; New York No. 2 spring, June option, at $1.07; do., July option, at $1.01½, and No. 2 northwest spring, June option, at $1.07½. Rye at 63½@64½c. for western. Corn at for No. 2, June option, at 44¾@45c.; do. July option, at 45¾c.; do., August option, at 47¾@47½c.; steamer mixed, June option, at 42½@42½c.; do., July option, at 43¾@43½c.; do., August option, at 45½c.; spot lots were New York No. 2 at 44¾@45½c.; mainly at 45c.; New York No. 3 at 41@41½c.; New York steamer mixed at 42@43c., the latter for choice New York No. 3 white at 5?c.; ungraded mixed western at 41@45½c.; round yellow at 52c.; Kansas mixed at 45@45½c., and yellow western at 45½c. Oats at for New York No. 1 white at 37c.; New York No. 2 white at 33½@33½c.; New York No. 3 white at 33½c.; New York No. 1 at 30½c.; do., August delivery, at 32c.; New York No. 2 at 31@31½c.; white western at 33@33½c.; No. 2 Chicago at 31½c.; white State at 32½@33c.; mixed State at 31@32c.; New York extra white quoted at 38c.; New York extra at 32½c.; New York No. 3 at 30@30½c.; No. 2 Milwaukee at 31½c.

HAY AND STRAW.—There are abundant supplies, and although low prices prevail for the lower grades especially, it is difficult to move them to any extent. Baled hay, 45@55c. for shipping, and 60@75c. for retail qualities; Straw quoted at 40@45c. for long rye, and 35@40c. for short rye; and 30@35c. for oat.

HOPS.—Crop reports have been a little more favorable the last day or two with the warm weather. The damage that has resulted by the unfavorable weather this spring is, from all late reports, even more serious than was thought possible. An advance has been made this week and the market closed strong. Shipments for the week have been only 208 bales. Quotations are for New Yorks, good to prime, 10@12c.; do., low to fair, 7@9c.; Eastern, 7@10c.; Wisconsin, 7@10c.; Yearlings, 2@3c.; Olds, all growths, 1@2c.; Pacific Coast hops, 10@12c.

LEATHER.—Hemlock sole at 19@20c. for light; 19@21c. for middle; 20@21c. for heavy, and 17½@19c. for good damaged.

OIL-CAKE.—Western is offered lower, quoted at $29 00@30 00 per ton.

POULTRY AND GAME.—Live fowl and chickens lower.

Fowls.—New Jersey or Choice, 10@11c; Southern and Western, 9c.; Roosters, 5c.; Turkeys, 8@10c; Ducks, Choice, 62@75c. pair, other, 40@55c.; Geese, N. J., $1.25@1.50; other, $1.00@$1.12.

Dressed poultry, quoted nominally for country packed as follows: Dry picked Phila., 12@14c.; other fair to prime, including N. J., 10@13c.; Spring Chickens, Phila., 20@24c.; Western, 16@18c.; N. J., 18@20c.; Phila. fowls, 13@14c.; other 10@12c.

Game has no rates except for p'geons; quoted, stall-fed, $1.25@1.50 doz.; flight, 93c.@1.00 doz.; Western Squab, 70@75c. Tame do., $1.75@2.

PROVISIONS have tended higher with a liberal demand. Mess pork quoted $10 25@10 50 for spot; $10 25 for July and August, and $10 40 for September. Bacon at 5¾c. for long clear and 6 and 6¼c. for short clear. Lard—Western steam at 7 25 for spot, June and July, 7 32½; for August, and September at 7 40. Steurine at 7¾ for prime Western. Tallow at 7 for prime. Beef hams at $21@22 50 for old and new. Beef—For extra mess, $11 75@12; plain mess, $10@11 50; punket, $12@13 for bbls.; extra India mess, $19@21 for city brands; do. Philadelphia, $18.50@$19.

RICE.—Sales at 6 ¾@6¾c., for Carolina fair up to 7¾c. for choice.

SUGAR.—Refined at 9¼c. for cut loaf; 9¾c. for crushed; 9¾@9¾c. for powdered; 8½@9c. for soft white; 7¾@8c. for soft yellow, and 9¾@9¾c. for granulated.

SALT.—Ashton's at $2 50; and $1 05@1 25 for other brands, with Liverpool ground at 60@65c.

VEGETABLES.—Old potatoes have no market and sellers are offering low. New are of good grade, cheap and abundant. Old range 75c.@$1.12 for best, 50@75c. for common. Bermudas also lower, $2.50@3 bbl.; new good to best, $1.50@2 the extreme for L. I. Green peas, marrow, L. I. 2 bush. bag, 80c@$1; small, 60@75c. N. J. bbl., $1.50. String beans, $2.50@3.50. Southern Cucumbers, crate, $1.50@2 50. Squash, half bbl., $1@1.25; Cabbage, per hundred, $4@6. Cauliflower, bbl., $2@$4; Asparagus, doz., Oyster Bay, $1.50@1.75; lower N. J., 75c.@1.00. Radishes, per 100 bunches, 40@50c.; Beets, do., $1.50@2; Rhubarb, do., $3@1; Lettuce, bbl., 25@50c.; Turnips, 100 bunches, $2@4; do., bbl., $1.50@2; Carrots, 100 bun. $1.50. New Orleans Onions, $2@2.25 per bbl. Bermuda Onions, crate, 60@70c.

WOOL.—New fleeces are now coming in from all parts, but as yet demand is not vigorous; XX Ohio fleeces new, it is supposed, will open at about 35c.

Ohio, Pennsylvania and Virginia quoted at 35@37c., for XX, 34@37 for X; XXX and picklock, nominal; 36@38 for No. 1, 33@35, for No. 2, 30@32 for common, and 38@42 for combing.

New York, Michigan, Indiana and Wisconsin. XX, 30@34c.; X, 32@35c.; No. 1, 34@37c.; No. 2, 30@33c; common 27@30.; combing 36@40.

Iowa, Vermont and Illinois X and XX, 30@33c.; No. 1, 32@35.; No. 2, 28@30.; combing, 35@38.

Missouri, Kentucky, and Tennessee—Washed fleece, 33@35c.; unwashed, 20@26c.: unwashed combing, 28@32c.

Tub-Washed.—Choice, 33@38; fair, 28@34; inferior and burry, 23@28.

Pulled Wool.—New York City extra pulled, 30@33; New York City super pulled, 32@36; New York City lambs pulled, 30@35; Western super and extra, 27@34; country extra pulled, 30@34; country super pulled, 33@37; country lambs pulled, 28@34.

LIVE STOCK MARKETS.

Saturday, June 22d, 1878.

BEEVES.—Receipts for the week, 11,945 head: do., last week, 11,041 do. It has been a blue week for sellers and owners. Cattle have been high-bought in the west in the basis of our recent buoyant markets; but there has been no day this week that has offered the later first costs. Since Wednesday evening the comparatively high decline has prevented many dealers from coming out whole and others report a loss of more than freight expenses. The cause of the weakness here is through a lull in the export demand, while warmer weather has decreased butchers' wants for consumption. The extreme price at the close was 10@10¾ for really extra stock, and those rates were only paid by exporters. The range for steers was 7¾@9¾c., including Cherokee and Texas at 7¾@8¾c. Still-fed stags and bulls, live weight, 2¾@3½c.

COWS AND CALVES.—Poor stock that struggles in takes a chance sale, and in the present silent condition of the market it would be risky to send fine milkers.

SHEEP AND LAMBS.—Receipts for the week 22,406 head; receipts last week 24,522 head. There is a fair demand for sheep. Lambs are native and higher. Sheep, poor to best, 3@4¾c.; including a carload of Texas, 3¾c. West and Southern lambs, 5¼@6¾c.; Near points, 7¾@7¾c.

VEAL CALVES.—Receipts for the week 4,420 head; do., last week, 4,093 do. Choice milk calves have had a steady good demand. N. J., 6@6½c.; State, 5½@6c. Buttermilk has been abundant and hard to dispose of at 2¾@4¾c.; fair qualities of fed calves 4@5¼.

SWINE.—Receips for the week 27,033 head; do. last week 27,581 do. A closing sale of Ohio was made at $4.15 per 100. Market steady.

Reading for the Young.

"POCKET-MONEY FOR THE YOUNG PEOPLE."—No. 8.

M. B. PRINCE.

In devising ways for the boys and girls to earn a supply of pocket-money, the parents should encourage each in that direction to which his or her natural tastes and inclinations seem to lead. In a family of ten there may be no two who take a particular interest in any one branch of farm operations: one will prefer the care of the poultry, another of bees, and so on with all the different kinds of stock, garden crops, &c. Whatever it is, so that it be proper and properly attended to, let each one follow his bent, and let none be left out,—even the little toddler should have a pair of Bantams to call his own.

It were well if the poultry could be entirely given up to the ownership of the youngsters, allowing them to pay for the feed required, in meat and eggs for family use.

Bees, as requiring but little capital, afford a source of profit, and, if closely observed, an endless amount of information and recreation. Where they can be had to work on shares, a few hives and honey-boxes will be all that will be required for a start. The usual terms are to return to the owner at the year's end the old stock, and one-half the increase.

Grafting and budding can soon be learned by any bright boy; and more or less employment may be had in any neighborhood. There is one thing often forgotten, that is, if the raw material is not salable on account of an over supply or other cause, it can be manufactured on the farm, and the girls may very properly assist in or even do all the subsequent business, after the boys grow the crop. The writer once knew a brother and sister who made a snug little sum from the manufacture of tomato catsup late in the season, when the price for fresh fruit was too low to pay. As a rule, farmers can hardly afford to manufacture for their own use, much less for sale, in competition with the great manufacturers. Nevertheless, there are many things that will go to waste unless utilized in that way; and the young people are just the ones to take hold and secure the benefits, not only as a pecuniary matter, but as a lesson in economy; also, when anything of the kind is attempted, all the information to be had to the point will be searched out, and thus useful knowledge will be stored up for future use.

CONCERNING SPIDERS.

BY J. H. EMERTON.

Every young reader of the Rural has noticed the round, regularly-formed spider-webs which often adorn the corners of fences, and the windows of neglected dwellings; but few, perhaps, have had time or patience to watch the skillful manner in which they are constructed, or to examine the apparatus by which the spider spins the thread out of her own body.

To illustrate the habits and structure of these spiders, we will select one common species as a representative of the whole group, and confine our observations to it. This species, the *Epeira vulgaris*, seems to be common all over the United States. It is seldom found in the woods and fields, but lives in great numbers on garden fences and trellises, in barns, and on the framework of bridges, the structure of which affords numerous crevices for concealment. When fully grown it is half an inch in length, and its feet, when extended, will cover a circle an inch and a half in diameter.

In sheltered places they spend most of the time in their webs waiting for prey, while in situations exposed to the sun they watch only in the night. During the day, and in stormy weather, they remain concealed in some crack or corner, near which, for convenience, the web is always placed. In such retreats they also pass the winter without food, and only covered by a thin web of their own spinning. Like other spiders, they are furnished with poisonous jaws, which they attempt to use when disturbed, but as they can only bite what comes directly between their jaws, they may be handled without fear. There are but few cases on record of a spider biting the human skin. Their timid nature leads them to avoid danger rather than resist it, and the common suspicion with which they are regarded has no foundation, except a want of acquaintance with their habits.

If we take a spider of the kind just described and turn it under-side up, we shall at once notice that the body consists of two nearly equal parts, connected by a slender waist. The front part gives origin to the organs of sense and motion, while the hinder part contains the principal internal organs. The most conspicuous appendages of the body are the four pairs of legs. Immediately in front of these is another smaller pair, the first joints of which are flattened, so that they may be used as jaws, or lips, for squeezing the food. Next in front is a pair of stout jaws, each of which is furnished with a sharp claw at the end. This claw is hollow, and is pierced with a minute hole near the point. When the spider bites, a drop of poison is discharged through this orifice from a gland in the head. This quickly kills insects, and causes inflammation of the bitten part in larger animals. On the front of the head are the eight eyes, four near together in the center, and a pair on each side.

The feet of the spiders are wonderfully adapted for walking on the web. Each foot is furnished with three claws, the middle one of which is bent over at the end, forming a long finger for clinging to the web, or for guiding the thread in spinning.

The outer claws are curved and toothed like a comb. Opposite the claws are several stiff hairs which are toothed like claws, and serve as a thumb for the latter to shut against.

The spinning organs are three pairs of fleshy appendages situated at the posterior end of the body. When not in use they are folded in towards each other, the third pair covering the second. The end of each of these spinners is covered with minute-jointed tubes. Inside the spider, and connected with the spinners are several bunches of glands, which secrete a liquid like the white of an egg. To form the thread this liquid is drawn through the tubes, which divide it into such small fibers that it dries almost immediately on coming in contact with the air. The spider has the power of uniting these fibers into one or several threads, according to the purpose for which they are to be used. The thread commonly used for the web is composed of hundreds of simple fibers, each spun through a separate tube. As the thread runs from the body, it is guided by the hind feet, which hold it off from contact with surrounding objects, until the desired point is reached, when a touch of the spinners fastens it securely.

When a spider wishes to build a web she usually selects a corner, so that the structure may be attached on several sides. She then runs a few threads along the objects to which the web is to be fastened, to facilitate her passage from point to point. The web is commenced by a line or two across the point where the center is to be, which is not usually the geometric center, but nearer the top than the bottom. Radiating lines are then spun from the center in all directions.

Having finished the framework, the spider begins near the center and spins a thread spirally, around the web to the circumference, fastening it to each radius as it crosses. The distance between the spirals varies with the size of the spiders, being about as far as they can reach. This spiral thread serves to keep the parts of the web in place during the rest of the process, and is removed as fast as the web is finished. It also furnishes a ready means of crossing from one radius to another where they are farthest apart. All the thread spun up to this stage of the process is smooth when dry, and will not adhere if touched with a smooth object.

The spider having thus formed the web, begins to put in the final circles at the outside, walking around on the scaffolding previously prepared, which she gradually destroys as she proceeds: until in the finished web only a few turns in the center are left. The thread of the circles last spun is covered with viscid globules, strung upon it like beads at short distances. If an insect comes in contact with the thread, it immediately adheres, and its struggles only bring a larger part of its body into contact with the web. Dust and seeds also stick to the web, so that in a single day it is often so clogged as to be of no farther use. The web also becomes torn by the struggles of the prey, and by wind and rain, so that it requires repair or renewal every night. In mending the web the spider usually removes all except the outside threads, biting them off and rolling them into a hard ball between her jaws, so that when released it will drop quickly to the ground. This probably gave rise to the opinion, sometimes advanced, that the old web is eaten by the spider.

When the web is finished she stations herself in the center, where a small circle is left free of the adhesive threads. Her usual position is head downward, with each foot on one of the radii of the web, and the spinners ready to fasten themselves by a thread at the least alarm. She often remains in her hole with one foot out, and resting on a tight thread connected with the center of the web, so that any vibration is quickly detected. If the web be gently touched the spider will rush into the center, and face towards the disturbed part. She will then jerk smartly several of the radii leading in that direction, to see if the intruder is a living animal. If this test is followed by the expected struggle she runs out towards the victim, stepping as little as possible on the adhesive threads, seizes it in her jaws, and as soon as it begins to feel the effects of the bite, envelopes it into a silken covering, and hangs it up to suck at her leisure. In spinning this envelope the insect is held and turned around mainly by the short third pair of feet, while a flat band of threads is drawn from the spinners by the hind pair working alternately like the hands in pulling a rope, and wound over it in every direction, so that in a few seconds it is so covered as to be unable to move a limb. When a web is shaken by the wind, the spider will sometimes draw in all her feet toward her body, thereby tightening the web in every direction so that the vibration is prevented.

The contruction of nets for catching food is not the only use of the thread made by these spiders. They seldom move from place to place without spinning a line after them as they go. They are able by its use to drop safely from any hight, and when suspended by it are carried by the wind across wide spaces without any exertion on their part, except to let out the thread. The crevices in which they pass the winter, and the leisure hours of summer, are partly lined and enclosed by a coating of silk resembling that used for confining captured insects. The eggs are enclosed in a cocoon of the same material, and there the young remain until they are strong enough to shift for themselves, growing to nearly double their size without apparent nourishment.

Several hundred young are produced by a single female, but probably it is seldom that one-tenth of this number ever reach adult size. Nearly all the spiders which we see in webs are females, or young. They spend most of their time in the vicinity of their webs, and many, doubtless, pass their lives within a few yards of the places of their birth. The adult males are seldom seen building or occupying webs: they remain concealed during the day, and at night wander about from web to web.

When the time for the final molt arrives, both sexes retire to their holes and cast off the skins of their entire bodies, even to the claws. This process obliges them to remain concealed until the new skin has acquired sufficient strength and firmness, when they again return to their webs. The females of some species of spiders are said to devour the males whenever opportunity offers, but I have never noticed that habit in this species, though I have often seen a female charge upon an intruding male, and chase him from her web.

Is UNIFORM—stiffens and finishes work always the same.

PERSONAL ITEMS.

Everbody has heard of Glauber's salts, but how many know whether Glauber is the name of a man or a place. He was in fact a famous chemist of Amsterdam in the sixteenth century, who invented the preparation bearing his name.

Thomas Winans, the Baltimore millionaire, who died near Newport last week, was a railroad contractor for the Russian Government from which he has received heavy royalties. He was also the inventor of the Winans cigar-shaped boat, and is said to have been worth $25,000,000.

As no concealment is made or attempted as to the pay of British Embassadors, we can give some of the amounts. In Paris, Lord Lyons receives $50,000 per annum; in Constantinople, Mr. Layard receives $40,000 a year; Lord Augustus Loftus, at St. Petersburg, receives $30,000; at Vienna, Sir Henry Elliot has $40,000: at Berlin, Lord Odo Russell has $35,000, in Brussels, Mr. Lumley has $19,400; at Rio de Janeiro, Buckley Mathews receives $20,000; in Pekin, Sir Thomas Wade has $30,000; in Copenhagen, Sir Charles Wyke has $18,000; in Rome, Sir A. B. Paget has $35,000; in Japan, Sir Harry Parkes has $20,000; in Holland, W. Stuart has $18,000; in Persia, W. T. Thompson has $25,000; in Portugal, Mr. Morier has $30,000; in Washington, Sir Edward Thornton has $30,000. In each instance the above are annual payments, and where the embassy has not a mansion of its own in the capital where it is located, a liberal allowance is made for rent.

Miscellaneous.

HELP!

FOR THE WEAK, NERVOUS AND DEBILITATED!

The afflicted can now be restored to perfect health and bodily energy, at home, without the use of medicine of any kind.

PULVERMACHER'S

ELECTRIC BELTS

AND BANDS,

For self-application to any part of the body, meet every requirement.

The most learned physicians and scientific men of Europe and this country indorse them.

These noted Curative appliances have now stood the test for upward of thirty years, and are protected by Letters-Patent in all the principal countries of the world. They were decreed the only Award of Merit for Electric Appliances at the great World's Exhibitions—Paris, Philadelphia, and elsewhere—and have been found the most valuable, safe, simple, and efficient known treatment for the cure of disease.

READER, ARE YOU AFFLICTED?

and wish to recover the same degree of health, strength, and energy as experienced in former years? Do any of the following symptoms or class of symptoms meet your diseased condition? Are you suffering from ill-health in any of its many and multifarious forms, consequent upon a lingering, nervous, chronic or functional disease? Do you feel nervous, debilitated, fretful, timid, and lack the power of will and action? Are you subject to loss of memory, have spells of fainting, fullness of blood in the head, feel listless, moping, unfit for business or pleasure, and subject to fits of melancholy? Are your kidneys, stomach, or blood, in a disordered condition? Do you suffer from rheumatism, neuralgia or aches and pains? Have you been indiscreet in early years and find yourself harassed with a multitude of gloomy symptoms? Are you timid, nervous, and forgetful, and your mind continually dwelling on the subject? Have you lost confidence in yourself and energy for business pursuits? Are you subject to any of the following symptoms: Restless nights, broken sleep, nightmare, dreams, palpitation of the heart, bashfulness, confusion of ideas, aversion to society, dizziness in the head, dimness of sight, pimples and blotches on the face and back, and other despondent symptoms? Thousands of young men, the middle-aged, and even the old, suffer from nervous and physical debility. Thousands of females, too, are broken down in health and spirits from disorders peculiar to their sex, and who, from false modesty or neglect prolong their sufferings. Why, then, further neglect a subject so productive of health and happiness when there is at hand a means of restoration?

PULVERMACHER'S ELECTRIC BELTS AND BANDS

cure these various diseased conditions, after all other means fail, and we offer the most convincing testimony direct from the afflicted themselves, who have been restored to

HEALTH, STRENGTH, AND ENERGY,

after drugging in vain for months and years.

TAYLOR RAKES.

Five Different Styles, including Foot, Hand and Self-Dump.

Taylor's Self-Dumping Rake (No. 4) has been greatly improved for 1878. This Rake made a great success last season, and is now the best Self-Dump Rake in the market.

These are the only Rakes ever offered the farming community that have proved a Complete Success, in all kinds of Rakings, in the United States, Canadas, British America, and in Europe and Australia.

Illustrated and Descriptive Circulars free. Address B. C. TAYLOR, Dayton, Ohio.

THE ARCHER RAKE.

THE ARCHER is the ONLY SELF-DISCHARGING RAKE without Gearing, Ratchels, Springs or Friction.

CARRIES LARGE LOAD AND DOES NOT ROLL THE HAY WHEN GATHERING.

Highest Grand Medal and Diploma at Philadelphia Centennial Exhibition awarded to the "Archer" after two days' field trial.

Send to Manufacturers or General Agents for Circulars describing numerous superior qualities of this valuable invention. CLEGG, WOOD & CO., Manufacturers, Dayton, Ohio, U. S. A.

Do You DO YOUR OWN Printing?

If not, why? A few dollars will buy an Excelsior Portable Press, Type, Ink, all complete, simply arranged, with which Cards, Labels, Envelopes, Billheads, Circulars, Etc., can be printed at QUARTER printers' prices. It *pays* and is pleasant to have your own printing apparatus. Send 6 cts. (two stamps) for full, illustrated catalogue, to the Manufacturers,

KELSEY & CO., Meriden, Conn.

Presses $3. and upwards.

Use the Anti-Friction Hay Carrier.

For elevating and conveying Hay, Grain, etc., in barn, barrack, shed or field. It elevates perpendicularly and conveys horizontally any desired distance. No trouble about getting over high beams and to the end of deep mows or to the top of high stacks. Thousands are now in use. Five tons have been stacked and the frame moved in forty-five consecutive minutes. Fifty tons have been stacked in a single day with this Frame and Carrier. SEND STAMP FOR CIRCULAR "O" to U. S. WIND ENGINE & PUMP CO., BATAVIA, ILL.

Portable and Farm Engines.

In our Patent Dry Steam Engines we claim superiority over all horizontal Engines, in the following points:

1st. Power developed for size of cylinder.
2d. Economy in Fuel and Water, using less of either than any Engines built.
3d. Quality of material used, it being the very best in all of its parts.
4th. Superior workmanship.
5th. Boiler is the best stayed Portable Boiler built. We defy competition.
6th. The completeness of Engine and Boiler in all its details.
7th. The most perfect Governor made.
8th. Long bearings—always cold.

We claim our Boss Clipper Engines to be the simplest, strongest and most powerful vertical Engine made.

1st. It is the only vertical Farm Engine that has a perfect and substantial mounting.
2d. It stands steadier when in operation than any Engine made, requiring no artificial support.
3d. Construction of Boiler, which is such that the water always covers the flues and flue head.
4th. A superheating steam dome, and short connecting pipes, working no water in cylinder.
5th. Simplicity of construction; a Corliss frame; always in line; never getting out of order.
6th. Great accessibility to the working parts, ease of management and safeness from fire.
7th. Best material and workmanship.

We have the largest line of Engine Patterns in the United States, including a line of Stationary Engines from 10 to 150 Horse Power, plain or extra finish. Portables from 3 to 40 Horse Power.

We are successors of the Utica, or Wood & Mann Steam Engine Co.

Our Engines are suitable for and can be applied to machinery for Mills, Mines, Threshers, Saw Mills, Cotton Gins, Sugar Mills, Hoisting purposes, etc. In fact, every purpose for which steam power can be applied. ☞ The only Farm Engines using Patent Angular Drive Belt.

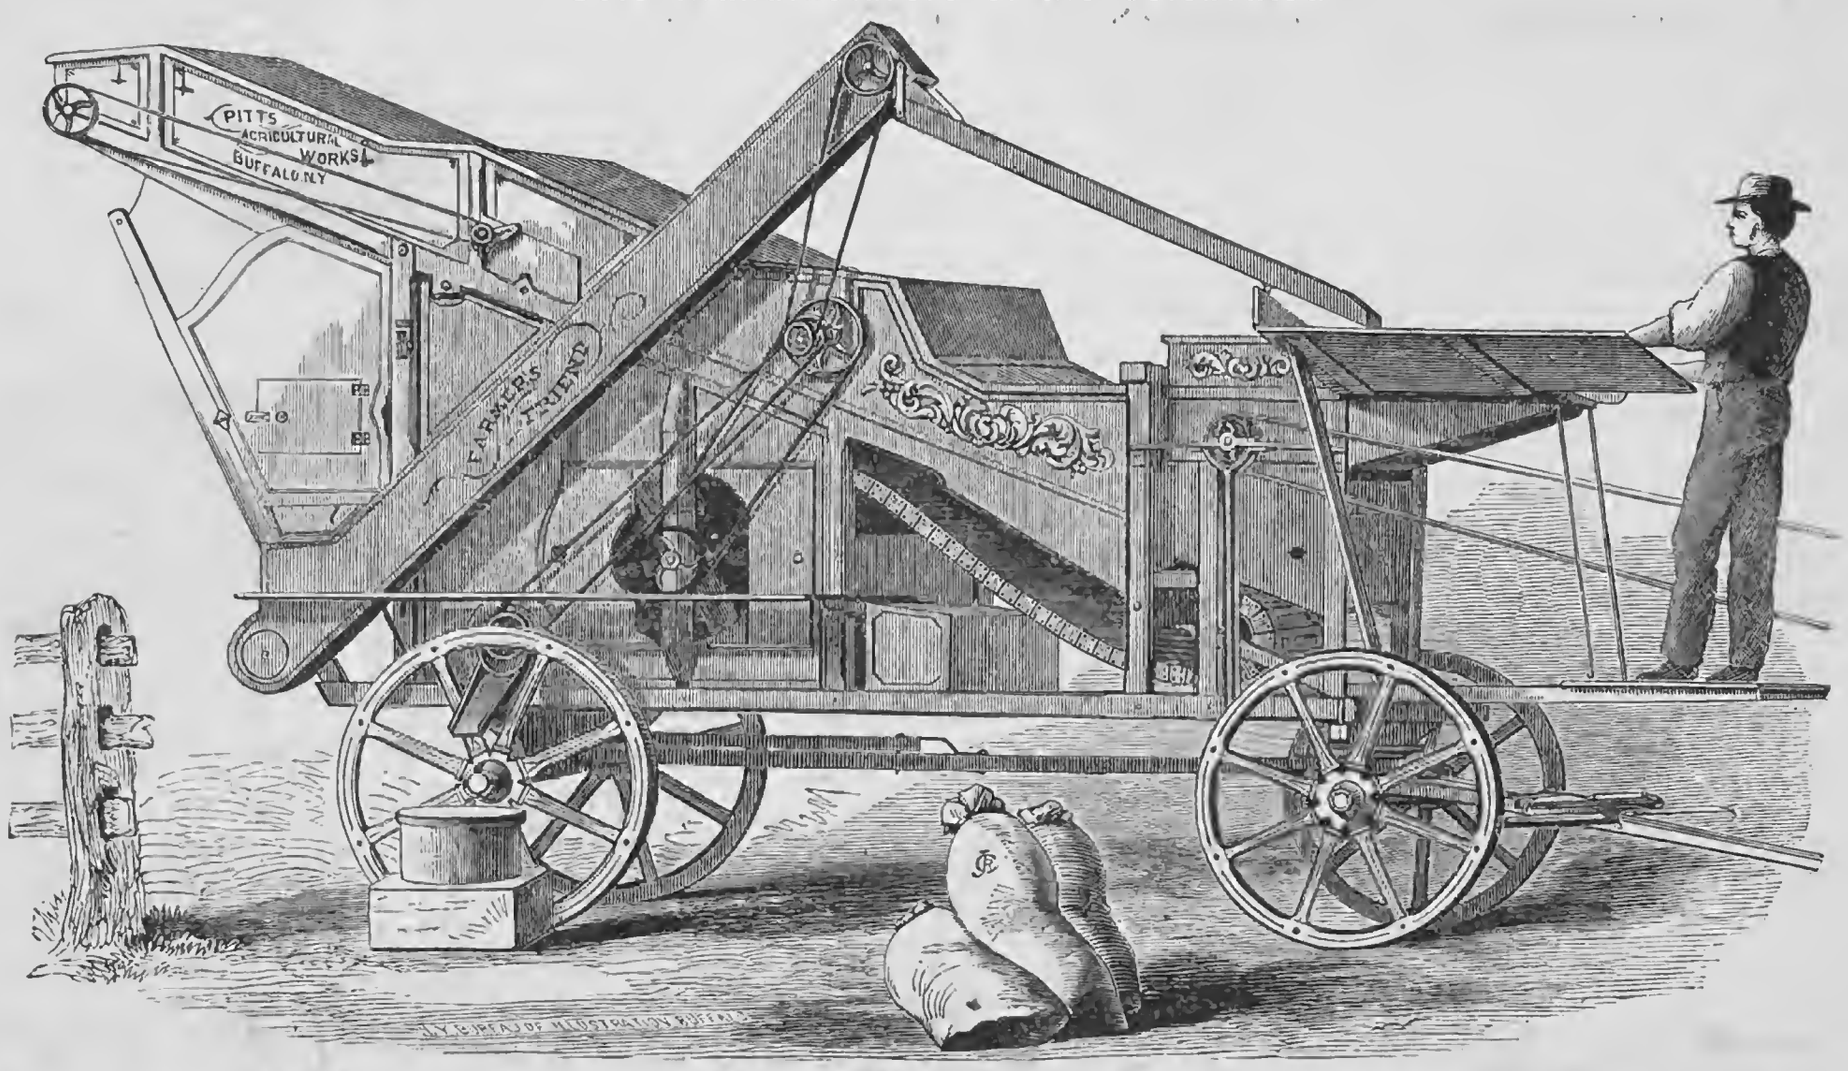
The Pitts Agricultural Works,

BUFFALO, N. Y., U. S. A.,

(Successors to John A. Pitts, Brayley & Pitts, and James Brayley),

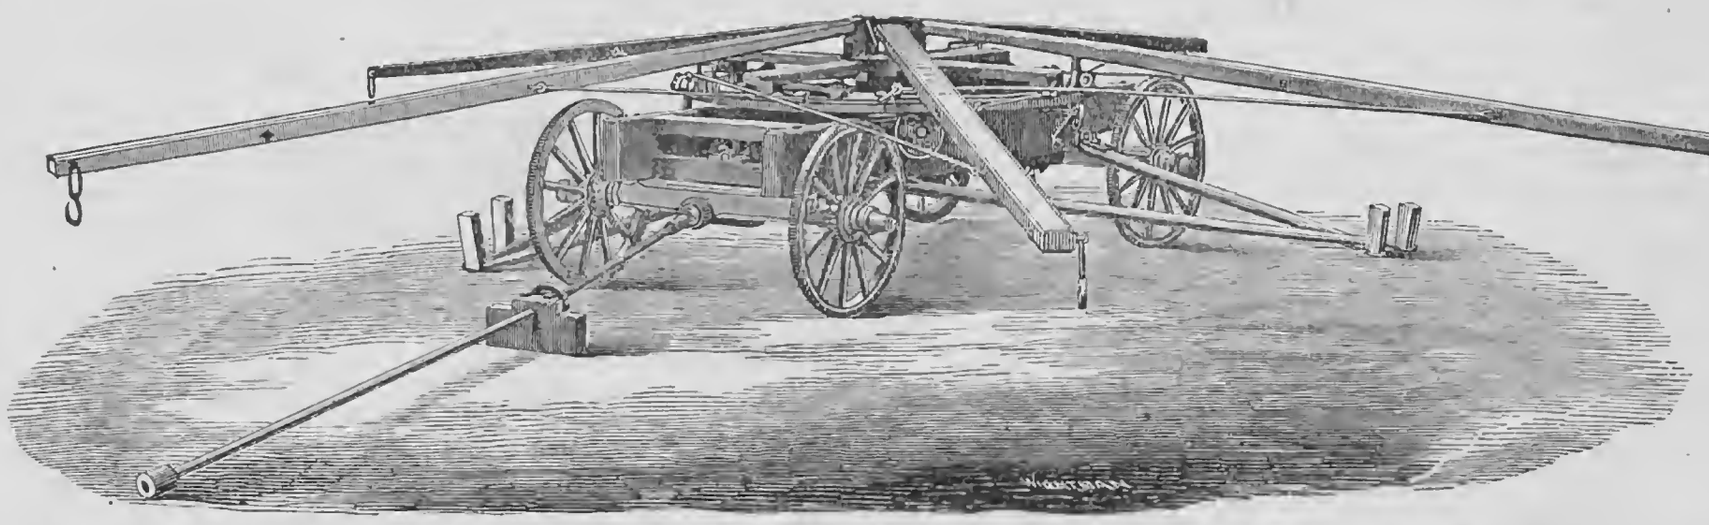
Sole Manufacturers of the celebrated



Buffalo Pitts Grain Threshers and Cleaners,

Rice Threshers, Double Pinion Horse Powers, mounted or down, etc.,

THE "Buffalo Pitts" threshes and cleans FIT FOR MARKET all kinds of *Grain, Flax and Timothy Seed.* With a given amount of power it will *thresh more grain or seed, clean it better and waste less* than any other Thresher and cleaner in the world. It is built in the most *substantial manner*, of the *best materials*, and is *handsomely and durably painted and ornamented.* It is *simple in construction, easily managed* and not likely to get out of order. Various sizes are made, increasing 4 inches in length of cylinder and width of cleaner for each size, from 24 inch threshing cylinder, with 32 inch cleaner to a 48 inch cylinder, with 56 inch cleaning parts. Two styles of the 24 inch, 28 inch, 32 inch and 36 inch cylinder machines are made; one driven by tumbling shaft and the other by belt. All of the 40 inch, 44 inch and 48 inch cylinder machines are built for driving by belt. The BELT THRESHERS are *extra strong framed*, have *extra heavy solid steel cylinder shafts*, with *pivot point bearings*, and in every way are built with *special reference to use with* STEAM OR WATER POWER. Special attention is given to the building of THRESHERS AND CLEANERS FOR FOREIGN COUNTRIES. Thirty years' experience in this department, during which the *Buffalo Pitts has victoriously competed with every other first class thresher in the world*, enables us to furnish for each section a *thresher peculiarly adapted to the wants of the country* for which it is intended.



THE BUFFALO PITTS DOUBLE PINION HORSE POWER,

(MOUNTED OR DOWN),

Has *for over thirty years* been acknowledged THE STRONGEST, THE SIMPLEST AND THE EASIEST RUNNING Horse Power in the world. During the last two or three years IMPORTANT IMPROVEMENTS have been made, which by reducing the friction have *lessened the wear and increased the effectivness of the power applied.*

THE BUFFALO PITTS MOUNTED POWER is a *Genuine Mounted Power built from the bottom*, with special reference to being used on wheels and is *not*, like most so called "mounted powers," only a down power fastened on a wagon. Four sizes of both Mounted and Down Powers are built, viz: for 4 horses, for 8 horses, for 10 horses and for 12 horses.

MOORE'S RURAL NEW-YORKER.

RURAL AND HOME AFFAIRS. ARTS, SCIENCE, LITERATURE, NEWS, MARKETS, ETC.

VOL. XXXVII. No. 27.
WHOLE No. 1484.

NEW YORK CITY, JULY 6, 1878.

PRICE SIX CENTS.
$2.50 PER YEAR.

[Entered according to Act of Congress, in the year 1878, by the Rural Publishing Company, in the office of the Librarian of Congress at Washington.]

PARISIAN CORRESPONDENCE.

PARIS, June 16th, 1878.

THE fourteen million francs which the projectors of this Exhibition expected to receive from the entrance fees, hardly seems too high an estimate in view of the great number of daily visitors down to the present time. During the past week the average attendance has been in the neighborhood of 115,000 each day, while on Monday last, nearly 200,000 persons entered the buildings either on the Trocadero or the Champs de Mars, and owing to the exhaustion of the indisponsable printed tickets, many thousands more were forced to remain unwillingly outside.

The Trocadero itself and still more its lavishly ornamented grounds, are favorite lounging places for the pleasure-loving Parisians and their pleasure-seeking guests. Here one of the prettiest and most frequented spots is the Japanese farm, inclosed by a bamboo palisade, The farm-house is characteristically Japanese, of the better class, and stands in the midst of a handsome garden. Instead of windows and doors, the house is furnished with shelter mats, which in fine weather are rolled up in order the better to exhibit the interior which is furnished in genuine Japanese fashion—a fashion which would be considered rude and insufficient in many of your back-woods settlements, but which answers admirably the simple customs and wants of the semi-civilized natives.

In the garden is a poultry inclosure constructed of the ubiquitous bamboo, and tenanted by a swarm of Japanese cocks and hens whose appearance, to the uncritical eye, differs little from that of the denizens of American farmyards, although either of your contributors, Messrs. HALES, MINER or WALLACE, could doubtless point out a multitude of distinctions. Close to these, a bevy of ducks of far Eastern breeds, enjoy a large sunken tub as mightily as they would the ponds or puddles of their distant native land. Scattered about are large china pots containing Japanese plants whose beauty or grotesqueness would add to the charms even of the Rural Experimental Grounds, and there be fortunate in finding an eloquent pen to describe their attractions.

The chief merit in the whole of this display, and also in the neighboring Chinese buildings, lies in the fact that they convey to the stranger a fair idea of the better class of architecture in the land which they represent, and this is a merit wholly lacking in the structure erected by the United States in the Avenue of Foreign Nations, across the river, on the Champs de Mars. In the long row of representative buildings that line the right side of this magnificent street, that which has been constructed under American auspices is certainly the least nationally characteristic, and probably the least expensive. It is a frame building, oblong in shape, surmounted with a smaller fac-simile, which is crowned with a pepper-box look-out, the whole bedecked with a considerable quantity of scroll-work ornamentation. Of the appropriation of $150,000 made by Congress for the purpose of insuring a fair exhibition here of American products, only a very small percentage could have been appropriated to the construction of this edifice. In a land whose vast extent bespeaks great differences in the climate and appropriate dwellings of its inhabitants, the styles of architecture must necessarily greatly vary, but in no part of the country has a great deal of travel ever brought to my notice a building architecturally designed like that which is here erected as a model of American architecture. If there really is such a thing as a distinctively American style of architecture, this certainly does not represent it; and if it is an embodiment of the ideal transatlantic architecture of the future, the American ideal, in this connection, can hardly be said, even by a partial friend, to be of a very high order.

SOME of our captious Parisian critics are by no means complimentary in their remarks upon the homely style and material of this building, and the entire absence in its design of those national architectural characteristics of which the structures in this avenue were designed to be specimens. But apart from this last shortcoming, it is perhaps best, after all, that only a minimum percentage of the miserly appropriation doled out by Congress should have been expended on the merely temporary receptacle of our industrial exhibits. These are displayed in a line extending away back from this building which acts as a frontispiece on the Avenue of Foreign Nations; and in view of their conceded excellence even the most susceptible patriot can endure with equanimity the sneers of unfriendly French writers, especially when he remembers the miserable display made by their compatriots at our Centennial Exhibition in Philadelphia.

THREBER.

Farm Economy.

DRAINAGE.

PROF. R. C. CARPENTER.

DRAINAGE is the art of carrying off the water from the soil and subsoil of land by means of open ditches or closed drains or trenches. By means of drainage, wet land naturally unfit for cultivation has been made arable, land which produced only rushes and frogs has been converted into the best of meadows. Drains even affect the sanitary condition of the country, for it has been shown by statistics which cannot be doubted, that on a subsoil constantly wet and retentive of water, diseases are much more prevalent and vicious than in a region with a dry subsoil. This last consideration alone, should be sufficient to induce a thorough system of drainage, for no compensation can cover the loss of health, or replace the value of human life. But the stubborn fact that drainage costs money, appears to many an almost insuperable obstacle, and hundreds, yea, even thousands of people in Michigan, are breathing the pestilence from malarious marshes, and slowly but surely infusing into their system a poison which must bring them to an early grave, without exerting a muscle to remove from existence the cause of all this evil. In many districts, where malarial diseases are prevalent, one-half the amount spent for doctors' bills, would effectively remove the stag-

AMERICAN BUILDING ON THE AVENUE OF FOREIGN NATIONS.

nant water, which to a great extent causes the diseases. But when sanitary considerations are alone involved, money considerations are with the parties interested, of more importance.

But fortunately in this case, financial as well as sanitary measures are united, and the overpowering logic of increased financial returns, induces action when all other measures fail. It needs little argument at this late day to convince persons that it will pay to drain wet lands; everybody admits that, in most cases. It is, however, extremely difficult to state just when it will pay to drain upland and when it will not pay. Each case will have to be considered from its own standpoint; you will have to take into consideration the value of your land, the total cost of underdraining and the probable increase in value of your crops. If the increase in value of your crops will not pay a good interest on the cost of underdraining, it will not pay to put in drains. But I doubt if there is any heavy clay land, except it may be above a porous subsoil, but what will return to its owner good interest from a liberal investment in under-drains. As the value of the crop is increased, this percentage of increase from drainage becomes of more and more importance, until in some cases the increase in crops alone for a single year, will more than pay the expense of drainage, or, in other words, your investment will repay you more than 100 per cent.

METHODS OF DRAINING.

Draining may be performed by open or by closed ditches, or under-drains. The method of constructing open ditches usually employed is shown in Fig. 1.

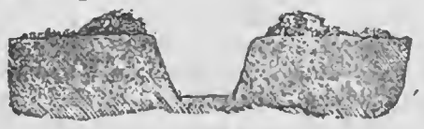

FIG. 1.

Such ditches are neither efficient nor permanent. The proper shape that an open ditch should have in cross section, is shown in Fig 2. This form can usually be made with a land or road scraper, otherwise it will be too costly for general adoption. The open ditch is at best an unsightly ravine, and it is always more or less in

FIG. 2.

the way. These objections are of so much importance that it can hardly be considered of any practical value to agriculturists, except to serve a temporary purpose, or in some exceptional cases, where a large area is to be drained, to take the place of a natural water-course.

UNDER-DRAINS.

I shall further consider only the construction of under-drains, which I shall denote by the single term "drain" now usually employed for that purpose. As drainage is to a great extent an empirical art, I cannot better illustrate the various processes employed than by giving a history of some of them.

Drainage by open ditches was no doubt the first mode of freeing land from superfluous water. The Roman agricultural writers mention the good results arising from covered drains, which were formed of wood and other substances, which served, so far, to render the land dry. More than a century ago, a large extent of clay land was drained at narrow intervals in Norfolk and Essex, England, by putting in brush, wood and even straw in the bottom of the drains. The progress of draining, which is now regardad on many soils as essential to economic culture, was slow and partial, until Mr. SMITH of Deanstone, about the middle of the nineteenth century, reduced the practice to a system, and showed the principles upon which its efficiency depended. Through the exertions of this advocate, thorough drainage came to be looked upon, in England, as a necessity on a clay soil or indeed on any soil in a moist climate. Before the general use of drain tile, stones were the common materials with which drains were formed. They were thrown into the ditch promiscuously from nine inches to a foot in depth, and covered with earth, thus forming a body that water readily passed through. Mr. SMITH recommended that no stones be used for this purpose that would not pass through a ring of 2½ inches in diameter; or when flat stones in sufficient number could be found, the stone drains were so laid as to make a box or trough through which the water flowed. This was found to produce an efficient drain, but in neighborhoods where stones were scarce the drain was very costly.

When tiles or pipes were first used, it was thought necessary to have some small gravel or stones about them, in order that the water might soon find its way into them, but it was found out that the drains were as efficient without the gravel, and moreover not as likely to be filled with sediment, as the natural soil allowed the water to percolate through it slowly, thus filtering out all impurities. Many kinds of pipes or tiles have been used. The first form tried was the horse-shoe tile without a bottom. This, when laid on the natural ground, soon became filled with earth by the rising up of the bottom, caused by the great pressure on the sides of the tiles from above. The next improvement in the tiles was the addition of a bottom. These were objectionable because they left a wide space on the bottom and did not confine the stream flowing through them sufficiently to clean out the dirt or silt which accumulated in them. The next improvement was the sole tile, which afforded a good passage for the water, but was objectionable because of the mechanical difficulties of construction, it being hardly possible to make them perfect. The sole tile affords a cylindrical passage for the water, but has a shoe or flat rest on one side, to lay next the bottom of the ditch. The latest improvement in the shape of tiles is to make them simple, circular cylinders about one foot in length, and with walls about one-half inch thick. These tiles offer a good water-way, and, having a circular section, they can be laid any side up; consequently a good joint can be secured, even if the tiles are slightly warped, as is usually the case. Again they are, next to the horse-shoe tiles without bottom, the easiest tiles to construct, and consequently the cheapest. These tiles present another advantage—they can be laid in collars, which are rings about three inches long, which pass over the contiguous ends of the tiles and form a close joint.

SIZE OF TILES.

When tiles were first used, it was thought that an internal diameter of one inch was sufficiently large for ordinary cases, but the smallest tile in ordinary use at the present time has an internal diameter of one and one-half inch, while the largest is not less than eight inches. The size of the tiles to be used should be such that all water falling on a piece of land will be conveyed away before it has time to injure any crops that may be growing on the land. The exact time that crops will stand inundating without injury, depends so much upon the variety of the crop that no definite time can be stated. Probably if the water is removed within 24 hours of the time of falling, no injury will be done to most farm crops, as in this case, water will not remain on the surface of the ground to exceed six hours, except in extreme showers. On this basis, we can calculate quite accurately the size of the tile needed, since we can find, by consulting tables of meteorological observations, the greatest rainfall that may be expected in 24 hours, and if we so proportion our tile as to convey this water off within the same time, no injury can be experienced by the crops.

In order to find the number of acres that can be drained by tile of a given size descending at a given rate, we must know three conditions: first, the amount of water that may reasonably be expected to fall on each acre during any day (24 hours) in the growing reason; second, the discharge of the drain as compared with the rain-fall; third, the capacity of drains running full at various inclinations and of various sizes.—[To be continued.

Agricultural College, Lansing Mich.

Farm Topics.

STUDY ON THE FARM.

M. OAKEY.

To every farmer I say: "Be a student." "What a farmer and a student?" Yes, certainly, both, and the better the student the better the farmer.

I like that word student. In its original meaning it signified "to desire strongly," "to be eager for," and implied the putting in operation, and diligently using every means to secure the end desired. How applicable this is to the farm in all its departments! It must not be supposed that study applies only to books. It is true there are many works treating on his profession, that the farmer cannot neglect or pass over without loss, and the same is true of the current agricultural periodicals; they should not be slighted. But it is not intended that the farmer should turn aside from the field and shut himself up in a study, and turn bookworm. It is the farm above all things else that he should strive to gain complete knowledge of, and that practically. To be wide-awake and progressive, however, farmers should obtain all information possible from every source, and digesting and modifying it, use it as a means of enlarging their experience which is too often confined to only that descending from the father.

But this is only a means to an end. The farmer must learn thoroughly his farm. He must know its soil; its needs and its adaptability. He should be eager to find out in what department, or branch of farming, he is likely to obtain the best results. He is to study its improvement, both in increasing its production, and in its appearance. A good farmer will take pride not only in obtaining the greatest product per acre, but in having the finest-looking farm in the neighborhood. In improving its appearance as a farm, he certainly will increase its yield. Study the farm.

Then study the crops. Learn their needs, their best mode of cultivation, and the most approved implements for their cultivation. All these the farmer should be eager to know. He should apply to every experience, to experiment, and even to much-abused theory, not his own alone but all to which he has access. Because a man has raised certain crops all his life-time does not prove he knows all about them, or even that he knows the best methods of treating them. He should desire and strive for the best, cleanest, and most remunerative fields and crops in his community, and no one should be able to excel him. This study makes more difference with farmers than is generally supposed. It has more to do with the success of one and the failure of another, than any difference in soil or opportunity. A successful farmer must study his stock. Sometimes I think a farmer can be better judged by his stock than in any other way. A good farmer seldom has poor stock, and, pretty generally, a poor farmer seldom owns good stock. The effect that a man's animals have upon him can not be over-estimated. A thrifty farmer will not only have good cattle, but he will study to know them, their temperament, their habits, their needed care, and their income. He will learn the safest and surest way of obtaining that income from them, and in satisfying their wants he will take new interest and pride in them because of their grateful and improved condition, as a matter of safety and economy. He should study his stock too. I knew a farmer of thirty years' experience who, raising a very fine heifer from which he expected something better than usual, lost her after her first calf because he did not know, as he said, "cows' bags ever got lumpy, and I did'nt know that any thing was the matter until too late, and did'nt know what to do anyhow."

Nor should farm machinery be slighted or neglected. The farmer should not only know how to handle his plow, but he should learn the principles involved in its construction. He should comprehend too the superiority of one implement over another. It will not do to trust to salesmen or their glib tongues, or yet to rely entirely on the experience of others, for what one will handle intelligently, and successfully, will prove a failure in the unthinking hands of another. In the Franco-Prussian war it was admitted that the chief superiority of the Prussians was in their more intelligent use of the weapons in their hands. Yet both armies were equipped with like implements.

Nor must farm economy be overlooked. Here is a vast field for diligent study and ingenuity too. "To know just where a dollar may be saved and where invested to produce its proper income, is study indeed. The fact is that many farmers instead of learning this, choose to hoard what few dollars they may grasp instead of adding them to their capital to increase their revenue. This works badly on the farm, for narrow-minded and greedy parsimony is sure to follow. And all the comfort and enjoyment that a farmer's life should possess is crushed out by the great weight of niggardliness. To save a few dollars on the preparation for a crop, or in its cultivation and fertilizing, is not always true economy. Often the few extra dollars thus spent render the whole crop profitable. The whole question of thus spending here and withholding there is of vital importance to the farmer and should receive his best thought and care. Is it not clear that a farmer should be a student?

POETRY ON THE FARM, ETC.

NORTON HILL, GREENE CO., N. Y.

THIS spring there were some failures among the farmers in this vicinity, and many good people lost by them. One of my neighbors remarked that they were men that worked too much and thought too little, a saying which I came to believe was about so, when I thought the matter over. They and their families and their hired help had worked night and day, and their hands had become calloused with labor in carrying on a large business. They had very little time to read and observe, or to keep books, so that they could know whether their business paid or not. It was with pain we saw these brother farmers of ours go under, hard-working as they had been and well as they had struggled to build themselves up. There was one case among them where our feelings of pity were not so great. The man had a good farm given him and got a good property by his wife; but he had spent the golden hours of youth and manhood in trying to accomplish nothing, and had succeeded; still we mourned his fate somewhat, but as not without hope, as he has, since his failure, gone to work. Most of the farmers hereabouts are making slow but sure progress. Year by year a gradual improvement is coming over their homes, thanks to their own energy and the agricultural press, which most of them patronize and enjoy.

In a late RURAL I saw a piece entitled "The Poetry of the Farm."

"Yes," said I, as I reviewed in my mind's eye some of the pictures which I had seen in the good RURAL time and again, such as the old fogy farmer's bull in the spring, the farmer who did not know whether it would be best to move his barn or the manure pile, and the one where the farmer stands in the cottage door at midnight, in clothing unmentionable, listening to the silver tones of the screech-owl, perched on the chimney, "Poetry," says I, "yes, I have heard it sometimes." Said I to myself, "Come to think, I heard it when one of my best hogs died this spring; when one of my best calves feeling so good while frisking joyously about, collided with his mate and broke his neck; when coming to plow my corn this spring, I found that the crows had dug and pulled out by the roots about one-tenth of one piece; and—another stanza—when one of my Jersey heifers became a confirmed kicker: yes, there is poetry in farming, come to think about it."

So I mused, and just then up ran two rosy-cheeked girls, such as can be seen only on the farm. "There is another couplet," thought I, and looking out of the window my glance fell on long lines of apple trees in full blossom, which father and I planted when I was only a little boy; then going out on the veranda to take the fresh, pure air of spring, and hearing the songs of the many welcomed feathered visitors that come to us year by year, thinks I, "there is another verse or two." Looking to the right I see my cattle in the spring grass, happy and contented on the hill-side, and the sight was by no means unpoetic.

Putting on my hat and lighting my pipe, "I guess I'll feed my pigs," thought I, and going to the pen, each of twelve upturned noses says "give me some good sour milk." By the way, a man told me last fall that the best breed of hogs he ever had, was a well-filled swill pail of nutritious food,—but in those twelve pigs were poetry and music. Visions of broiled ham, of roast spare-rib, of ham and eggs, and of sausage, danced before my eyes, and pleasing thoughts came of stomachs, owned by family, friends and help, well-filled from those plump fellows. And to fill up the measure, twelve tails all curled up in cues, or like old-fashioned musical notes, on their twelve backs. "Poetry!" said I, "yes, even in hogs."

Knocking the ashes out of my pipe, and going to the barn, I find friends there. There is Old Bill, the bay that used to carry my father so safely about the country. The hands that used to guide him are now quiet, as are those also of the driver's companion, my mother, and Old Bill, looking out of those large, honest eyes, seems to feel that he, too, is getting old and needs my sympathy and regard, as he gently whinnies and says, "good morning." There, too, in a line stand the wagons that have become so familiar to us, and in which we have all enjoyed ourselves often. "Poetry," says I, "yes, lines of gold endeared by thoughts of the past, when father and mother, as well as the boys and girls, were all at home on the farm."

Going through the barn to my poultry house, I see ducks, geese, hens, especially Guineas, and peacocks. But there! Hear them all sing together, and cackle, and gobble, and quack, and screech; and if any man with poetry in his soul doesn't feel the inspiring effects of that concert, his poetical ideas are of a very dull order.

Stepping over to my cow-barn, there are the open stalls of the cattle that fed here last winter, but which are now filling out their sleek hides and enlivening a fine landscape view, visible from my door-way. If there is anything that can find its way into a good farmer's heart, it is a good herd of cows, with well-filled bags, pasturing in good clover. For me there has always been in cows poetry of a high order.

Going from the stables into the orchard, "Popy, is there a-going to be fruit this fall?" ask my little girls who are with me now. The trees give cheerful promise that we shall have good times next winter in passing around golden Pippins and winter pears. Glad am I to see nowadays that almost every farmer has a pan of apples on his center-table, so that anybody that wants them may have almost any kind that he may desire from fall until spring.

Then, there is the dear wife, who still continues to bear the burden and heat of the day, but whose life is now cheered by the help of her boys and girls, who begin to feel and know what mother has done for them. Her step may not be as light as it was fifteen years ago, but the cheerfulness of the home which she has helped to build up and embellish, sends a ruddy, satisfied glow over her cheeks, and warms the whole household with sunshine and gladness. Poetry! yes, I have heard it; and it is in thousands of farm homes in this land. Despite all the sin and evil in the world, in the majority of farm homes poetry, love, virtue, benevolence, hospitality and charity gladden and cheer all those who come in contact with them, and make gleesome poetry on the farm. W. H. I.

Field Crops.

BARLEY ON CLOVER SOD.

WM. J. FOWLER.

THIS year I am trying an experiment in growing barley on a newly-turned clover sod. It is apparently working so well that I am much encouraged to repeat it as often as I have occasion. I had about twenty acres of clover last year cut for hay in June, and for seed in

September. Not wishing to plow and plant so much, I was at a loss what to do with it. The clover I was satisfied would not amount to much this year, as it rarely does the second season. Some advised summer fallowing and sowing with wheat in the fall; but the field was clean from weeds and it seemed a pity to lose the use of it for the year. The early days of April were bright and warm, so, putting in a three-horse team in a twelve-acre field, I had it nicely turned under in a week's time. I used the jointer plow, leaving a good mellow seed-bed on top. This was well harrowed, taking about half as much time as the plowing, and I drilled in 2½ bushels of barley on the 19th and 20th of April together with about 100 lbs. of phosphate and 100 lbs. of gypsum mixed, per acre. The field was in good heart, and the growth of barley is all that could be desired. The seeding was thick and the plants have tillered until the stalks stand about as close as they well can. No one who sees it can doubt that the barley roots are now feeding on the clover-sod whose decay is hastened by the concentrated fertilizer as also by the dense mass of barley leaves on the surface. The manure has also given the barley a good send-off, and enabled it to sooner reach the sod. I doubt not that the barley crop will be doubled by the fertilizer applied. Good judges estimate it at fifty bushels per acre.

Undoubtedly much of this favorable result is due to the moist season we have had; but in any weather, I believe that clover sod, well plowed, will insure a good barley crop, if a little fertilizer is applied with the seed. The clover decaying in the soil, keeps it moist, and this year also keeps it warm as well. After a week of dry weather we are having a fine rain which insures sufficient moisture till it is ready to cut. The joints are formed and, in a few days, heads will be pushed up, and the ground will keep moist from this rain until they are filled. It is of the six-rowed variety, which in a good season and on rich soil will yield more than the two-rowed, though the latter is safer if soil and season are unfavorable.

This fall I shall re-turn this sod, and sow with wheat, with phosphate and gypsum as before. The clover sod will be decayed enough to furnish just the pabulum which wheat roots delight in, and next spring I can re-seed with clover. I shall have an advantage in this, as a good many clover seeds were dropped last fall and turned to the bottom of the furrow. When the barley stubble is turned under, these will be brought up and will grow next fall or next spring. I have known good clover on fields from the seed scattered after a second crop of clover. Unless left very near the surface, clover seed will remain in the soil for years.

This plan of sowing barley on clover sod avoids the labor and expense of so many hoed crops, but it is only adapted to soils free from weeds. It has a very important advantage over the old-fashioned rotation of wheat and summer fallow after clover each alternate year. It gives one more year for clover roots to grow; and only takes one wheat crop in three years, instead of one every other year. In an average of seasons, I think too that the spring grain will be worth as much as the wheat, so that this rotation nearly doubles the profit in a course of three years.

Pomological.

RUSSIAN APPLES IN AMERICA.

T. H. HOSKINS, M. D.

Few, perhaps, think or remember, when reading of the "Colossus of the North," in these days of Eastern warfare, that nearly the whole of the great Russian territory, both in Europe and Asia, lies north of the parallel of 45°, the northern boundary of New York and Vermont. Yet this is the fact, as a reference to the map will show. Moscow, the central city of the Empire, lies just below latitude 56°.

Europe is not as cold, on the same parallels, as our Atlantic States; but the most thickly settled and richest parts of Russia have a winter temperature quite as severe as any part of New England or Canada. Yet orchards are abundant there, and the apple-trees most healthy and productive; while in Northern Vermont, New Hampshire, Maine, New York and Lower Canada, with slight local exceptions, the apple production is quite insufficient for home consumption, and the business of fruit-growing is considered precarious and unprofitable.

Some thirty or forty years ago, trees or cions of some Russian Apples were brought to this country, and their beauty and productiveness have rendered them popular in many localities. One, the Red Astrachan, is largely planted from Louisiana to Canada. The Duchess of Oldenburg is the "stand-by" for hardiness and productiveness in Minnesota, Wisconsin and Northern Maine. The Emperor Alexander is marked as a profitable Apple to grow for market in Lower Canada. The Tetofsky is regarded as the hardiest of all Apples in Minnesota, the coldest State of the Union. Beauty, productiveness and hardiness are the marked characteristics of these Russian Apples. In quality they, none of them, rank with the best, and not one of them is a keeping apple. The latest, the Alexander, keeps only until November.

The necessity for a strain of apples, the trees producing which should have a greater resisting power against severe winter cold than the popular sorts of the Middle States and Southern New England, led to the introduction of the Russian varieties into all the coldest parts of the country. The demand for winter apples not being met by them, our Department of Agriculture, in 1870, imported from St. Petersburg a quantity of cions, nominally embracing 251 distinct varieties. These cions were distributed about among fruit-growers, mostly in the colder sections. A considerable number were sent to Vermont. Many of these cions, being grafted into large trees, have already borne fruit, which has been tested and exchanged among the growers with a lively interest. The greater number of these are plainly summer and fall fruit; and a great deal of disappointment has been experienced on that account by growers, who forget that many remain yet unfruited, and that usually the early Apples are the first to produce fruit, and that later kinds will probably be more numerous among those which will bear their first apples in 1878 and successive seasons.

The list sent out by the Department along with the cions, was but a bare schedule of names, without a particle of description, or the conveyance of any idea in regard to the season or quality of the fruit, save what the name itself might convey. So far as the writer knows, no account of this important importation, — whence or by whom it was gathered, what were the characteristics of the fruit of each, as grown in their native localities, their seasons, qualities, or relative esteem and market value where known,—has ever been made public by the Department. If there are any data from which such an account, however brief or imperfect, could be drawn up, now is the time for it to be put forth, that growers and experimenters may compare its statements with their experience with the new fruits as they are developed.

The writer has seen and tested the fruit of some thirty varieties of these new Russian Apples,—a few from his own trees, and the remainder sent to him, as a connoisseur, from different parts of Vermont and the North-west. It is not my intention to go into an extended description of any of these now. I reserve the subject for another time, when the added experience of one or two more seasons will give both fuller material and an opportunity for a revision of judgments based only on single tests. I will simply indicate a tentative opinion that among early summer Apples of this class, No. 334—Yellow Transparent—and 344—Sultan Apple—deserve to be tested alongside of Tetofsky. Among those a little later, No. 342—Charlottenhaler—is very large, and of quality comparable with Colo's Quince. No. 336—White Transparent—resembles the Early Harvest in fineness of texture and freedom from the "sour-water" quality of juice, that seems characteristic of too many of the early Apples of this class. It has substance and richness, united to a mellow quality. No. 317—White Pigeon Apple—is down in my notes as of medium size, yellow, with delicate carmine streaks; flavor neutral, almost sweet, with an indescribable spicy mingling of apple, pear and banana flavor. No. 368—Sugar Barbel—is a good early sweet. The only winter variety that appears valuable, so far, is No. 402—Borsdorf. This seems to be a long-keeping winter apple of finest quality; size rather large, oblate, obscurely ribbed; skin smooth and glossy, green with brownish-red cheek; flavor much like Peck's Pleasant.

Orleans Co., Vt., May 24.

Landscape Gardening.

FRUIT TREES FOR ORNAMENT.

SAMUEL B. PARSONS.

For lawns and landscape effect the only essential things are variety in form and color and taste in grouping. There is generally an impression that these can be obtained only by means of what are termed ornamental trees and shrubs; hence fruit trees are planted in straight rows for bearing, rarely in groups for landscape effect.

While the best results are produced by the finest ornamental trees and shrubs, it is a mistake to suppose that no landscape effects can be obtained with fruit trees and shrubs alone. Those who are familiar with the country in May and June, know the great beauty of the orchards when Apples, Pears, Cherries, Plums and Peaches are a sheet of bloom of various shades of color. There is also great variety in form; the round-headed Apples which generally prevail, are occasionally varied by a pyramidal form like the Lady Apple or the more dwarf habit of the Siberian Crab. In Pears the Buffum is almost as pyramidal as a Lombardy Poplar, while other varieties are graded from the roundest head of the largest trees to the more dwarf Seckel or Manning's Elizabeth. In Cherries and Plums there is the same difference in form, and one familiar with them soon learns to note it.

So it is in color; the shades are varied, and an ordinary workman will soon recognize each sort by its tint.

Thus it is possible to obtain with fruit trees alone those contrasts which aid to make a picturesque lawn. The Purple Peach is almost as dark as the Purple Beech, and occasionally dotted among other varieties, gives a good picture effect. Then the blossoms of Peaches are of all shades, from snow-white to carmine. Nothing can be more ornamental than the American Chestnut, with its tall, pyramidal form, and its abundant racemes of flowers, while the round head of the Spanish Chestnut is very different. The darker Hickory is stately and sturdy, and always valuable for its Shellbark varieties. The very dark purple-leaved Hazel contrasts strongly with the common sorts, while the different shades of Currants, Raspberries, and small fruits can form the shrubbery.

Were I making a country home, I would appropriate five acres of land, or ten acres if my ambition were larger, in the middle of which I

JAPANESE FARM ON THE TROCADERO.

would place the dwelling or other buildings. I would then surround it with a strong, pale-fence six feet high. On the inside of this fence, which faced the north, I would plant Blackberries and Raspberries; on that which faced the south, east or west, I would plant hardy grape vines. Next the fence on the inside there should be a space of five feet, then a drive of twelve feet, then a space of five feet, thus leaving an open space of twenty-two feet before planting anything which could shade the Grapes, Blackberries or Raspberries. Until the trees planted inside of this twenty-two feet become large enough to make shade, the five feet each side of the drive could be filled up with Strawberries or other fruits, or the more ornamental vegetables. Then at this distance of twenty-two feet from the fence I would plant apple and pear trees, choosing the sorts for their contrasting forms and colors.

To avoid the stiffness which a square gives, the drive should be the gently-curving segment of a circle, and the plantations should conform to it without falling into any regularity. The effort should be to make the space around the house an amphitheater, with turf in front and trees for the boundaries.

The larger trees—Apples, Pears, Cherries, Chestnuts and Hickories should be planted on the outside of this amphitheater. Then in front of these should come the lower-growing Pears and more dwarf Cherries, like Early Richmond, with Plums, Peaches, Nectarines, Apricots, Mulberries, Crab Apples and English Walnuts. Then should come Quinces, Raspberries, Currants and Gooseberries, while Strawberries could finish the embroidered belt, like a rug upon the turf carpet.

Some will prefer a broad, open lawn in front of these trees, but for many the effect would be improved by extending out occasionally a spur or peninsula of plantation, forming between them coves or small lawns visible to each other, by small vistas through the spurs. The broad spaces of lawn would still remain, and the outlook from the house would be full upon it as upon a Roman arena, with the graded hights of trees on the outside for the galleries of spectators. No trees should be near the house, and nothing be permitted upon the turf excepting bedding-plants or low growing shrubs for color, and even this effect could be obtained by fruit-bearing shrubs alone. Purple Hazel, Purple Berberry and other fruit-bearing plants could be planted in masses and kept low with great effect.

I have clearly in mind the charming results which might be obtained in a lawn planted exclusively with fruit trees and fruit shrubs. I here only sketch an outline; should any one wish to form such a place, I will take pleasure in furnishing a more carefully elaborated plan.

Arboricultural.

THE CONIFERÆ OF CALIFORNIA.

WM. C. L. DREW.

THE native evergreens of California are not surpassed by those of any other part of the world, and for gracefulness, majesty and rapidity of growth, they have few, if any, equals. It is for the purpose of drawing the attention of intending planters to the peculiar merits of the most beautiful of our Coniferæ, that I submit the following brief description of those I believe will give the best satisfaction as ornamentals or for useful purposes.

PINUS LAMBERTIANA.

Lambert's Pine, was discovered and named by Douglas. This magnificent tree is usually known as the Sugar Pine; when the trunk is burnt or wounded a sweet substance exudes, and from this circumstance arises its familiar appellation. It is excelled by no other in California for timber—making clear and handsome lumber.

The trunk of this Pine grows from 125 to 275 feet high. It is characterized by an unusually straight growth, and is destitute of branches for from one-half to two-thirds of its hight. The foliage is similar to that of the Pinus strobus—White Pine; it is rigid and of a bright-green color. The cones are from one foot to twenty inches long, and ten to twelve inches in circumference in the thickest part; they are pendulous from the ends of the branches; like the foliage, they also in form resemble P. strobus. The seeds are large, sweet and palatable. They are gathered in immense quantities, slightly roasted, and used as food by the native Indians; the shell is thin and easily broken.

It is a stately and magnificent tree, and next to the Sequoia, it is the giant of the forest. It occurs in groves with P. ponderosa, in the higher and moister sections of California; in the Sierra Nevada it is very abundant in the higher altitudes. As it grows where snow lies on the ground for four or five months, it should be hardy in the East. [It is.—EDS.]

P. PONDEROSA.

This variety was also discovered and named by Douglas, and was sent by him to England as early as 1825. The timber is solid and heavy; indeed, so great is its weight and solidity, that it will scarcely float in the water. It grows from 85 to 125 feet high, with a handsome straight trunk, for 30 to 50 feet of which are free from branches. It is remarkable for its strength and luxuriance. Its branches are very regular, become pendulous with age, but are horizontal while young. It is familiarly known as Yellow Pine.

[Pinus mitis, the short-leaved, and P. Australis, the long-leaved Yellow Pines. We do not know how many other *Yellow* Pines there are.—EDS.]

Its foliage, which is flexible, is long, broad and sharp-pointed and very thickly set on the branches. While young it is straight, but becomes twisted with age. Its cones are small, ovate and straight, and are borne erect; seed small.

This for an ornamental tree, is the handsomest Pine known. The head is very close and full, and of the greatest symmetry conceivable. The foliage is a very rich dark-green. It is widely distributed over California, but grows to the greatest perfection in the Sierra Nevada.

P. CONTORTA.

Like the preceding, this was also discovered and named by Douglas. This is the most dwarf of all our Pines, attaining to a hight of only eight to twenty-five feet. It is popularly known as the Twisted-Branch Pine from its peculiar habit.

Foliage somewhat succulent, flexible, a dark, rich green in color; cones small, ovate in form while young, but becoming nearly round with maturity. Its twisted branches are borne at almost right angles with the main trunk, and produced in whorls. Its native haunts are moist, swampy situations, and in such positions it is very striking. Useless except for fuel.

P. MURICATA.

The true name of this species is not as yet satisfactorily settled; besides the above, it is also known as P. Edgariana and Obispo; its familiar name is Bishop's Pine.

It grows from thirty-five to sixty feet high, but is useless except for fuel. It has an extensive range, but is always found in moist situations, near the sea-shore or in very high altitudes. The foliage is flexible, silvery on the under-side, a pretty green above. Its small, ovate cones are very persistent, clinging to the tree many years after the seed have perfected and been distributed. It is a ponderous and noble-looking tree, remarkable for its freedom of growth and hardiness. Likely to do well in the East.

P. INSIGNIS.

This tree, one of our handsome and stately forest kings, was the discovery of that indefatigable worker, Douglas, who also named it. It grows from 50 to 125 feet. It is principally found in the section of country around Monterey, from which the familiar name of Montery Pine is derived. It abounds in that region in immense forests of many acres.

The foliage is of a very dark green hue, very thickly set on the branches, and twisted in every direction: indeed, for irregularity of length, diversity of habit, and the way in which the foliage is twisted, it would be hard to find a counterpart to it in any other Pine. The outline of the tree, like the leaves, is very irregular, consisting of only a few irregularly spreading branches. Cones, small and persistent. The whole appearance of the tree is remarkable and so distinct from any other species, that it cannot but be desirable.

P. SABINIANA

Is another discovery of Douglas, it being also designated by him. While young it is halfway pretty, but when matured it is positively ugly. It has several local appellations, as Nut Pine, and Bull Pine, Digger Pine, and White Pine. The foliage is thin, long and straggling and of a light-green color. The cone is very large and heavy, ovate or conical in shape; the scales are terminated in upturned hooked spurs. The nut is large and much prized by children, who gather immense quantities of them. The shell is hard and thick, requiring a pretty heavy blow to break it.

The tree is flexible and of very crooked growth. This Pine has always appeared to me to be diseased, it having large, ugly swellings on all the branches. I have never seen one but what was thus affected. The wood is useless, except for fuel and miserable for this purpose, on account of its crooked growth

[There are many who speak of Pinus Sabiniana as one of great beauty. Mr. HOOPES says that the beautiful, regular form presented by a perfect specimen of this tree is all that he could wish for in that respect: and when to this is added a compact mass of deep-green verdure, gracefully extending to the ground, he does not know of anything more desirable. EDS.]

P. HEISTATA.

A fine species and sure to meet with favor. It attains a hight of from 40 to 75 feet. The foliage is of a rich green color, well set on the branches. Cones of small size, conical in shape; branches somewhat crooked, but of pleasing outline in general. Like P. Sabiniana, this has several local names, as Bent Pine, Soft Pine and Scar Pine. Seems to prefer a moist situation.

P. TUBERCULATA.

A handsome Pine is this, attaining to a hight of 75 feet. It is a very slow grower. The trunk is usually of small diameter, neat habit and straight. Foliage of a bright green hue, set moderately thick on the branches; cones are borne in clusters, usually of three each, oblong in shape, four to five inches long. They are usually persistent, having been found on the tree at least ten years old. Prefers a moist situation.

P. FLEXILIS

A peculiar and handsome Pine, growing from 30 to 75 feet high. Foliage rich green color, well set on the branches. Branches somewhat irregular and flexible. Cones of medium size, persistent, conical in form; outline neat but sometimes very irregular. Found in high altitudes and moist situations. Growth rather slow, but will be found of peculiar merit on small places. Only useful at fuel.

LIBOCEDRUS DECURRENS.

This is one of the handsomest of California's coniferæ; discovered and named by Torrey; familiarly known as California Arbor-Vitæ, and Cal. White Cedar. It attains to a hight of from 30 to 75 feet, and a diameter of 2 to 4 feet. Foliage a beautiful dark-green hue, well set on the branches; forms a handsome and moderately dense head of beautiful form.

CUPRESSUS MACROCARPA.

This species was discovered and named by Hartweg. The tree is the most magnificent Cypress in cultivation, attaining a hight of from 30 to 60 feet. Foliage a brilliant dark-green color, very finely cut, and densely set on the branches. Cones large, conical in form. Familiarly known aa Monterey Cypress. A tree of such remarkable growth and beauty cannot be but desirable in any collection. The tree is very hardy and will grow in any soil. [Not hardy here.—EDS.]

TORREYA CALIFORNICA.

Discovered and named by Torrey. Familiar name, California Nutmeg. The rich dark-green of the foliage makes this at once a bold and beautiful tree. Foliage resembles that of the Spruce, but rather light and thin. Tree attains to a hight of 50 to 60 feet. Branches of a slender, drooping habit. The Torreya belongs to a group of cone-bearing trees peculiar for the excellence of their wood; but the cones are entirely distinct from those of any other of our native trees, resembling the nutmeg of commerce. It will be found very desirable in all collections; and, as it is found in high latitudes, I think it will prove hardy in the Eastern States.

ABIES DOUGLASII

One of the handsomest Spruces known, attaining a hight of from 50 to 175 feet. The foliage is a rich green color, well set on the branches. The trunk of the tree is destitute of branches for over one-half of its hight. The tree is of very erect growth and very symmetrical. The wood is of fair quality and makes fine lumber. This Spruce cannot but prove desirable.

SEQUOIA SEMPERVIRENS,

or, as it is commonly known, Redwood, is a grand and stately tree with no rival except Sequoia gigantea. The timber of this tree is fast superseding all others in California for house building and other purposes. The grand and beautiful green foliage of the tree makes it one of the finest of our native evergreens for ornament. That it will prove valuable either as an ornament or for profit there can be no doubt.

SEQUOIA GIGANTEA,

also known as Sequoia Wellingtonia, the well-known "Big Tree" of California, requires only a passing word. The beautiful cypress foliage renders it a fine ornamental tree. The cone is small—about two inches long by one and a quarter in diameter—conical in shape, somewhat persistent. The bark is very thick, in some places 12 to 16 inches through. The wood is of fair quality and makes good lumber. In the East, where it will grow, it will be a valuable tree.

JUNIPERUS CALIFORNICA,

or, Cal. Cedar, a magnificent evergreen; Cupressus Mac-Nabiana, or Golden Cypress; Abies Mertensiana, or Cal. Spruce; Pinus Coulteri, all fine Coniferæ, must be passed for want of space and time.

El Dorado Co., Cal.

Horticultural.

GARDEN TALKS AND WALKS.

THE BEECHES, Mass., June 20, 1878.

A GENTLEMAN came to me the other day for information regarding planting some shade trees. He stated his case in substance as follows: "I am building a house on Belmont Hights, where the situation is high and exposed on every side, and I want to plant a number of large shade trees around the house, so as to give us some shade right-away. I can get any number of fine large trees such as I want in the wood near by our place, but how to move them is the question. I have read a good deal about very large trees being successfully transplanted that were lifted with large balls of frozen earth about the roots. Now, what do you think of the applicability of the plan to my purpose?"

I explained that forest-trees are mostly "natural" seedlings, that, never having been transplanted or otherwise artificially cared for, have formed a vital tap roots, and their surface-feeders are so far-stretching and sparingly fibered that it is almost impracticable to lift and transplant a ten to twenty-year-old tree from the forest or wood with safety as regards its life. Digging a trench around the trees before removal, in order to secure the frozen ball, in the case of trees in the woods, would, too, be almost useless, because it is not the ball of earth that is to save the tree's life, but the number of fibrous roots that are therewith secured unhurt; and as the roots of such "natural" trees, never having been checked, stretch out so far, it is very improbable that enough of them could be secured to save the tree. And the tap-root, which in the case of one or two-year-old trees is severed or checked in transplanting with benefit to the plant, is, in the case of wildlings, allowed to develop unhurt, till after a few years it is of such vital importance to the tree that to dissever it would be to almost, if not quite kill the plant. Besides, I am no advocate at all of the frozen-ball system. It certainly has been used very satisfactorily, and its advocates have as much right to their good opinions regarding it as I have to mine in favor of fibrous roots, and lots of them, without frozen earth. But in your case, I should adopt certainty, by going or sending to some reliable nurseryman for such trees as you want. They keep big trees in stock for just such purposes, and as these trees have been transplanted in their infancy, and again, maybe once, twice, or thrice since, they will have secured such a large mass of fibrous roots, and that so close to the stem that they can not only be lifted easily, but packed for shipment to any distance with facility, and they are almost certain to grow away briskly. And even if the nursery trees be considerably smaller than the trees you refer to in the woods, in a few years you have living and thrifty trees, and not stumps as dead as a fence-post. I am a strong advocate of fall planting, but in the case of such a bleak exposure as yours, I would prefer planting in early spring. Dig big holes, deep and wide, and fill up again with the best of the old soil and some good fresh soil, peat or old muck. Spread out the roots and introduce fine soil among the rootlets; never dump a tree up and down in a hole to settle the earth about the roots. Pack the soil firmly about the roots. If necessary, stake each tree securely. For a year or two after planting, a heavy mulching of old manure, pine "needles," or any other like open material will be of great benefit.

I walked through the garden of John C. Gray, Esq., at Mount Auburn, the other day. Mr. Welch, the gardener, has quite a reputation for growing peaches under glass, and he has a very nice crop, indeed, coming on. Those in pots are ripe and ripening, and are stood outside since a few weeks to give the fruit its proper flavor. Mr. W. complains severely about the borers. They usually enter the tree a little below the surface of the soil, and then their first presence is often unnoticed; but in order to stop this practice he has little zinc collars some four to six inches in diameter, and three or four inches deep round the base of each tree, so that they are imbedded a little more than half their depth in the soil, and then between the zinc and the tree is firmly packed with clay. Mr. W. claims that this prevents the borer entering beneath the earth surface, but instead, it enters above the clay, where its presence is immediately observable, and itself killed by the punch of a wire. RENOCLAF.

STRAWBERRIES.

H. HENDRICKS.

Now that we are in the midst of the season for this luscious and wholesome table fruit, is it not well for cultivators to compare notes as to varieties, soil, and the general management of bearing plants? Many, yes most of us, have grown Strawberries for years, either in private gardens, or in larger areas for market. Some, if not indeed the majority, have been content to grow only one or two common varieties, as the Wilson for example; being satisfied with an abundant supply of fruit, with no special regard for fine flavor. Others with more sensitive palates and greater facilities for their gratification, have planted sorts of more recent introduction, and found places in their gardens for many of the new, fine-flavored varieties as they came from our enterprising hybridizers and propagators. A few of this latter class have grown an extensive variety under varying circumstances, carefully noting the habits, peculiarities and merits belonging to each; and the results obtained, and opinions formed by these persons must, of necessity therefore, comprise the most reliable data we have on the subject.

To the non-producing consumer we must, however, accord a share of judgment in the general estimate, so far as relates to flavor. For some of these fully appreciate fine fruit and are willing to pay for it with nice discrimination; others claim to be connoisseurs in fruits and flavors, and will not desecrate their delicate palates with common varieties. Now, among so large a circle of readers as that possessed by the RURAL NEW-YORKER; it is surely fair to assume that all these various classes are fully represented. As one belonging somewhere in this list, I

will say that my own experience extends through many years and during that period I have grown and tested most of the new kinds that gave any promise of value, and also that it would be entirely proper to place myself and family in the category of consumers; for surely none have a better right to eat than those who produce; and the singular notion has prevailed in my mind that the berries which grew on my grounds and with my care and attendance tasted better than any others; which impression, if erroneous, is still most agreeable, and I would therefore advise every family in possession of a garden to raise strawberries at least for their own use. And yet in passing through the country I am sadly reminded of very many strawberry beds, that, from lack of care in culture or poor management, have become disgraceful failures, a tangled mass of weeds and grass. To all owners of such, I would counsel either more careful management, or that they devote the ground to some crop requiring less trouble and attention. For weeds grow spontaneously everywhere, and nowhere more luxuriantly and defiantly than under the fostering care and peculiar protection of a neglected strawberry bed where the runners are allowed to grow and take root. Thus it is that lazy people should never attempt the growth of Strawberries, unless they have the ability and willingness to pay for their proper culture.

The cultivation of the Strawberry in private gardens is of comparatively recent date. We find no record of its cultivation prior to the fifteenth century, and all varieties now known to us have originated during the present century. Previous to this all were wild varieties, there being only four or five. European cultivators were the first to raise successful seedlings; and it was from crosses on our American species found growing wild. The origin of the name, Strawberry, still remains unknown or obscure, I believe, the accounts of old authors being varied and conflicting. I can readily recall to mind the first introduction of this fruit into our family garden when a boy, and I was then old enough to be impressed with the fact that our strawberry bed was looked upon by friends and neighbors from far and near as a very doubtful and unpromising experiment. The variety then planted was the old Hovey seedling, the Pioneer Strawberry in this country, which I believe is still cultivated to some extent in certain localities. It being a pistillate, it proved unproductive grown by itself, and we therefore obtained plants of the Brooklyn Scarlet which were alternated with the Hovey; and thus the bed yielded some fine fruit the following season.

Since that time we have added new varieties as they were introduced and proved of sufficient value, discarding a very large number and retaining those only that most nearly answered all the conditions and requisites of a good, reliable family strawberry. Of late years the business of raising new varieties has grown to an enormous extent, and now the simple enumeration of them would require a volume, one cultivator alone having over three thousand promising sorts now growing. It is, of course, obvious that the difference between many of these is often so light as to be scarcely discernible to the unskilled. The Strawberry is more easily crossed than any other fruit; and although the business is not usually attended with any very alluring results of a pecuniary nature, the pleasure in sending out for the first time these little gems of their care and skill, together with a sort of fascination for the pleasant pursuit, seems a sufficient compensation to these enterprising originators and they keep at it from year to year; and we, more than they, are the gainers. Out of the many thousand seedlings thus obtained only a few are found worthy of propagation; and then again this list must be very materially reduced before going to the public; and then thirdly, it has to undergo another very severe reduction and elimination at the hands of cultivators in varied soils and climates. We have indeed, become very particular in this matter. A few years since the people were glad to get anything in the shape of strawberries with very little regard to flavor or variety; they were a luxury that required neither name nor special quality. But now we have passed that point, and the Strawberry of the present day must have a certified pedigree, with reliable references as to good behavior under any and all circumstances in which it may be placed.

From much careful observation and considerable reading I am led to conclude that the variety most generally needed throughout the entire country and by all classes, is one having the best possible flavor invariably, and which will grow in any kind of soil or climate and produce abundantly without any care, or at least with the most careless and slip-shod management that can be devised; and he who shall meet these requirements will be a benefactor indeed. If erroneous in this belief, I shall be most happy to receive correction. In view of this desideratum, then, it is obvious that the industrious hybridizer who seeks to meet the public demand, has a difficult task in hand. That he may fully accomplish this object is quite impossible; but that he can more nearly approach it than has yet been attained, there can be little question. In order to see how nearly this desirable result has been reached, let us look briefly at the leading varieties now in cultivation.

Some years since I obtained all the most prominent Strawberries then known, and not already in any collection, from Messrs. ELLWANGER of Rochester, N. Y. My collection then comprised the Jucunda, Triomphe de Gand, Lennig's White, Agriculturist, Napoleon III., La Constante, Nicanor, Colfax, Peak's Emperor, Romeyn's Seedling and many other varieties that I do not remember, both of home and foreign origin. I gave them every advantage of soil and culture in my power and brought most of them through three years of doubt and uncertainty with varying results. Of that entire list, however, but one has retained a place in my garden, and that is Lennig's White. And I consider this in many respects a most excellent family berry; a very healthy, vigorous grower, and its flavor is so fine and delicate, with that exquisite aroma that leaves nothing to be desired in that way. A dish of these pale pink beauties, on the table, is to me a very tempting desert. It is true, however, that they are somewhat less productive than some others, also the last portion of the crop is apt to run small in size. But for these reasons it is perhaps the best family berry we have. The Jucunda, grew and bore fairly, but the berry was not solid, and lacked flavor. Triomphe de Gaud tasted better but was less productive and lacking in vigor. Agriculturist was fair in flavor but somewhat defective in habit. Napoleon and La Constante, though both fine-flavored, large berries were weak and tender in growth and unsuited to the climate. Nicanor proved of no value on my grounds, surprising as this may seem to its worthy originators. It was small, sour, a poor grower and poor bearer. But for the fact that my plants were obtained from headquarters, I should, in view of all the praise that has been so generally bestowed on it, have doubted the identity of my plants. The Colfax proved a most wonderful bearer; and my plants were so fine that I was induced to exhibit a few in full fruit at the summer meeting of our Horticultural Society here, where they received a special premium. But the berries were small, rather sour and very soft; and though the most prolific variety I ever saw, I discarded it for these reasons. Romeyn's Seedling is a good berry, a rather vigorous grower and in most respects so similar to the Triomphe as to lead many to regard it as identical therewith. Burn's New Pine is an old variety, but in my estimation the finest-flavored strawberry yet produced. It is however a pistillate variety and not very productive; and still those who have room for variety should not fail to have this fine-flavored sort among them. Another very fine berry is the Charles Downing, and I regard it as a most desirable family variety every way, it is also quite productive. I am glad to see that it is now becoming more generally appreciated throughout the country as it well deserves. President Wilder has too good a name, for though pleasant-flavored, it is soft, unproductive, and most unreliable. Russel's Seedling is large and handsome, but of little value from its strong tendency to rot even before it ripens.

I might name others, all of which have proved defective and unsatisfactory here. I am now testing a few varieties of more recent introduction, among which Boyden's No. 30 is now very promising. It is the finest grower I ever saw, winters well, forms strong plants early, and bears abundantly: berries very large and fine-flavored, and very firm and solid in texture. I am much pleased with it thus far. Concerning Monarch of the West, Springdale, Star of the West and Cumberland Triumph, I am not yet prepared to speak with certainty. They are all doing nicely at present, and I trust they will bear out the glowing promises of their enthusiastic disseminators. During the past year or two a whole list of new seedlings have been let loose over the land with much *eclat*; but it is, of course, quite impossible to judge of their value at present. Among them may be mentioned Great American, and several others of Durand's seedlings; also Sterling, Crescent, Miner's Prolific, Duncan, Black Defiance, Duchess, Barnes' Mammoth, and hundreds of others. Col. Cheney has been highly commended by many, but my own experience with it has been somewhat unfavorable. It fails to ripen evenly to the end, is not productive, and lacks in vigor.

For years past the universal opinion of the people, all things considered, has been largely in favor of Wilson's Albany Strawberry, especially as a general market sort, and, on the whole, I think it has been accorded more good points than are found in any other variety; and yet I am inclined to the belief that now this great popular notion is undergoing considerable modification, and that ere long it will be largely discarded. It is very sour, variable in size and quality, and a very poor berry under the best conditions of growth. And still its great productiveness must be admitted; and it will, perhaps, bear abuse with better grace than any variety we have. It certainly has been the most successful variety of strawberry ever introduced into this country. When we read that the annual sales of this fruit in the four cities of New York, Boston, Philadelphia and Cincinnati, amount to the enormous sum of 1,500,000 bushels, it would seem that this strawberry interest is one of considerable magnitude, and well worth talking about.

ULSTER CO. N. Y.

Miscellaneous

JOTTINGS AT KIRBY HOMESTEAD.

COL. F. D. CURTIS.

WE are satisfied seed is not generally planted deep enough. Covering grain with a cultivator is better than with a harrow. Hereafter we shall use a harrow to mellow and pulverize the ground, and then take the cultivator to cover the seed. After the ground is made ready by the harrow, sow in the seed, and then with a two-horse cultivator go over the field, lapping enough so as to be sure not to leave any spots uncovered. This is for broadcast sowing. When grain is put in with a drill, the use of the cultivator is not required, as the drill does the work.

Clover seed will catch a great deal better sowed after cultivating than after harrowing. Clover seed is usually rolled in after the harrow. We are convinced this is a mistake; the practice of rolling in clover or other grain seed after a cultivator is a better plan, and when this is not done, clover and timothy seed should be harrowed in. When grain is drilled in, the grass seed may be covered by a roller and do well. Unless the season is very favorable, a great deal of grass seed rolled in after a harrow, will dry up, resulting in disappointment and loss. We have ten acres which is almost a total failure. This was rolled in. If the seed had been covered with a harrow it would not have dried up during the drought of last summer. A neighbor sowed his clover seed after the first harrowing and before the second, and his clover stood through the summer and resisted the frosts of winter, and now promises a splendid crop.

The above belief is proven by our barley this spring. It was covered by a cultivator with sharp steel teeth, each one rolling up a nice furrow and burying all the seed. High winds prevailed immediately afterwards, drying every bit of moisture out of the surface of the ground; but the barley came up promptly, and grew right on notwithstanding this check, which would have prevented the crop from growing if it had been covered as slightly as the harrow does its work. The cultivator will cut up weeds and tear in pieces clods the harrow slips over, and will leave the ground in better order for the crop. We are so convinced of these facts that we urge them upon the attention of farmers.

Every chicken which had the gapes has been entirely cured by being made to inhale tobacco smoke. The treatment has done them no harm, and the trouble of smoking is but little, if it is done when the chicks are in the coop. It takes but a moment to put them into a basket, and five minutes is as long as they should be subjected to the inhalation of the smoke, and not so long, if it is strong enough to produce stupor. As soon as a chick is stupefied, it should be taken from the basket and laid on the ground, when it will soon revive. Our chickens were nearly dead with the gapes when first treated, but got better with each treatment, and were cured after the seventh.

Sixty years ago a Mr. Hewitt bred a half-Jersey heifer, and as she proved an excellent cow, her progeny were all saved, and this family of cows are still owned and bred by Mr. Hewitt's son. They all have marks of the Jersey blood, and now and then a calf quite closely resembles the pure-bred type in color. They have always been noted for the richness of their milk, and butter made from them has always sold at the highest price, showing that "blood will tell."

When lambs are taken away from their dams at this time of the year, if the ewes have large udders, they should be milked several times, or else inflammation will follow in the glands of the bag and teats, and next year the udder may be spoiled. The lamb of a large ewe last year nearly starved before we found out what was the matter. We thought, at first, the lamb was sick, as the ewe had a full bag; but upon close examination we discovered that the milk could not be drawn through the teats. Neglect the year before had caused the stoppage. This year the ewes are milked. If they are shut up and fed dry food for a week, it will hasten the drying up of the milk, and save the trouble of going to the field for them.

In olden times the stripping-pail was thought to be a necessary part of the dairy furniture. The "strippings," the last milk drawn from the udder, is richer in butter than the rest of the milk, and this portion was carefully saved by itself, and put directly into the cream-pot. The "stripping-pail" naturally begot "stripping," and so the milker pulled away at a cow's teats as long as a drop of milk could be had. When dairies became enlarged, and cows were counted by scores, there was no time for "stripping" People who have large experience with cows think it entirely unnecessary, as the cream is not lost, and the practice tends to dry up cows, as milking is generally done at a time of day when cows feed best, but the time spent is a decided disadvantage.

The most economical way to milk a cow, all things considered, is to milk the two fore teats clean, leaving off with a pretty full stream, and then milk the hind ones down to a short stream, and, returning to the fore ones, milk them to the same condition, not touching the hind ones again. This will leave the teats empty, and the bag too. It is a false notion that tugging away at the teats stimulates a cow to give more milk; but, on the contrary, emptying the bag as soon as possible yields more; then the cow can have the extra time to eat, which is a better stimulus than either. A slow milker is never tolerated in the dairy districts, and a "stripper" is an injury anywhere. The sooner a cow is milked, and all of the organs connected with feeding, digestion, and secretion, are left in their natural condition, the better it is for the cow. For these reasons cows should always be treated gently, and never worried, as all of these excitements and disturbances have the effect to arrest the normal action of the functions, and consequent loss in the gain of flesh or the flow of milk.

Mr. SAUNDERS, the accomplished superintendent of the agricultural grounds of the Agricultural Department, Washington, D. C., sent us this spring cions of two of the varieties of Russian Apples imported from Russia a number of years ago. He has two hundred and fifty varieties now growing in the grounds connected with the Agricultural Department. They are all very hardy and useful kinds. One sent us is a very late keeper, and has been named by Mr. SAUNDERS the Saun-Ker-Matty, embracing his own name in part, and those of two of his associates. The other is the Yellow Transparent, or in the language of Russia, "Skwosnoi-Schotoi."

Mr. SAUNDERS informs us that he sent out, this spring, principally to the northwest, 17,400 grafts of these Apples. Among them were several kinds well known, as they have been so long grown in this country, such as the Astrachans, and some of the larger Crabs. The Apples are suited to our colder latitudes, where many of our native varieties kill out, and on this account are a valuable acquisition. And no doubt, too, on account of their individual merits, they will be welcome in other parts of our country.

CONNECTICUT AGRICULTURAL EXPERIMENT STATION.

NEW HAVEN, June 22, 1878.

Bulletin No. 17.—Fertilizer Analyses.

144 MAPES' GRASS AND GRAIN TOP DRESSING. Claimed 4.1-5 8 per cent. Nitrogen, 6 8 per cent. Phosphoric Acid, 3-5 per cent. Potash. Manufactured by Mapes' Formula and Peruvian Guano Co., N. Y. Sent May 28th, by S. M Wells, Wethersfield.

159. UPTON'S SUPERPHOSPHATE OF LIME. Claimed 2.4-3 3 per cent. Nitrogen, 10 12 per cent. soluble Phosphoric Acid. Manufactured by Geo. Upton, Boston, Mass. Sent June 6, by E. Stiles & Son, Willimantic.

163. BRADLEY'S SUPERPHOSPHATE OF LIME. Claimed, Sulphate of Ammonia 10 per cent., soluble Phosphoric Acid 7.5 per cent., insoluble Phosphoric Acid 7 per cent. Manufactured by Bradley Fertilizer Co., Boston, Mass. Sent June 2, by M. S. Baldwin, Secretary Nanqatuck Farmers' Club.*

165. SOLUBLE PACIFIC GUANO. Manufactured by Soluble Pacific Guano Co., Boston, Mass From stock of Rodney Kellogg, Hartford. Sampled and sent May 2, by J. J. Webb, New Haven.

	144	159	163	165
Nitrogen in Am. Salts	3.24		0.59*

* Potash in 165 is valued at 7½cts. per pound to make the analyses comparable with others previously published, but is obviously too high. Potash in 159 is valued at 4½cts per pound.

* This is represented to contain 10 per cent. Sulphate Ammonia, which is equal to 2.1 per cent. Nitrogen as Ammonia Salts. It really contains not more than 2.3 per cent. Sulphate Ammonia, equivalent to 0.59 per cent. Nitrogen. Nitrogen in Nitrates and Ammonia Salts is valued at 24cts., Nitrogen in Organic Matters at 20cts. per pound

S. W. JOHNSON, Director.

ANNUAL FAIR LIST.

THE following list of dates and places appointed for State fairs will be supplemented by full lists of local and county meetings as fast as they are received. We should be grateful for dates and particulars concerning these latter from any trustworthy source:

American Institute, New York	Sept. 11, Nov. 23
California, Sacramento	Sept. 16, 21
Colorado, Denver	Sept. 24, 28
Connecticut, Hartford	Sept. 10, 13
Dakota, ——	Sept. 10, 13
Georgia, Macon	Oct. 28, Nov. 2
Illinois, Freeport	Sept. 16, 21
Indiana, Indianapolis	Sept. 30, Oct. 5
Iowa, Cedar Rapids	Sept. 16, 20
Maine, Portland	Sept. 17, 20
Michigan, Detroit	Sept. 16, 20
Maryland, Pimlico	Sept. 24, 27
Minnesota, Minneapolis	Sept. 2, 7
Minnesota, St. Paul	Sept. 2, 7
Missouri, Madison	Sept. 9, 13
Nebraska, Lincoln	Sept. 23, 27
New England, Worcester, Mass	Sept. 3, 6
New Jersey, Waverley	Sept. 16, 20
New York, Elmira	Sept. 9, 13
Ohio, Columbus	Sept. 9, 13
Oregon, Salem	Oct. 10, 18
Pennsylvania, Erie	Sept. 23, 27
St. Louis Association, St. Louis, Mo	Oct. 7, 12
Texas, Austin	Oct. 29, Nov. 2
Texas, Houston	Oct. 22, 28
Vermont, St. Albans	Sept. 10, 12
Virginia, Richmond	Oct. 29, Nov 1
Wisconsin, Madison	Sept. 9, 13

The Querist.

ANSWERS TO CORRESPONDENTS.

Cranberry Culture.

P. G. Tracy, Hennepin Co., Minn., having a marsh of 25 or 30 acres, which, unimproved, bears a good stand of wild cranberry vines, wishes to learn the best method of improving, draining, flooding, and managing it as a cultivated cranberry plantation.

ANS. The most profitable sites for cranberry culture are heath ponds or low basins, places naturally flooded with water in winter; swamp lands in which deep deposits of muck are found; savannas or grounds lying between swamps and uplands; mill ponds whose water has been drawn off. Although cranberries are not infrequently cultivated successfully on alluvial uplands, still such locations are generally less desirable than the low, damp sites just mentioned. The best soil is a mixture of coarse sand and muck, made by covering a deposit of muck with a layer of sand. Both soon became thoroughly incorporated, forming a soil not unlike black sand. An abundant supply of water is necessary to profitable cranberry growing, but as stagnant water is injurious to the plant, the site of the plantation should be such as to permit of its drainage at least one foot below the surface. Another important material used in the preparation of cranberry beds is sand, which is spread over the surface of the ground to the depth of from two to eight inches, the amount being regulated by the compact or loose nature of the soil. This sand should be as pure as conveniently possible, free from any admixture of clay or loam.

In draining a swampy patch for cranberry culture, usually the first step is to dig a broad, deep ditch around it, for the purpose of drawing off the surface water, so that the ground may be cleared. The excavated soil, if sufficiently compact, may be used for embankments; otherwise, a firmer soil must be added or substituted. One or two main ditches should then be cut through it, and a number of side drains dug running into these, sufficient to drain all parts of the meadow at least twelve inches, or better still, eighteen inches below the surface.

The usual time for planting cranberries is in the spring from the first of April to the first of June, although the vine is sufficiently hardy to bear transplanting considerably later in the summer. Too much care cannot be taken in securing the plants from fruitful beds, as well as those that produce the largest and best fruit. They should be set in rows from eighteen inches to four feet apart according to the kind of plants obtained; the object being to mat the ground with their growth as soon as possible. There are several methods of planting, such as sod planting, hill planting, drill planting, planting by pressure, and sowing cuttings, for details of which space here is too limited.

In cultivating a cranberry plantation the main object is too keep down weeds and grasses and thoroughly drain the meadow.

To flood a meadow successfully; it is necessary to construct across the lower end of it a substantial dam the hight and strength of which must depend on the inclination of the meadow and the amount of water required to flood it. The time for letting in the water will vary in different locations, but it is a safe rule to apply it as soon as cold stops vegetation, and the vines commence to have a dull-red appearance. It should be kept on all winter, and until about, say, the first of May. Sometimes it is advisable to flood in summer, but then it is only necessary to apply water enough to give the soil a good soaking during a drought.

As a cranberry plantation is a permanent investment yielding returns for a life-time and needing a considerable preliminary outlay in its preparation, it is important that every precaution should be taken at the outset to render it a success. Sometimes the crop brings upwards of $1000 per acre and is nearly always remunerative. It would be well therefore, for a man intending to embark in this branch of industry to thoroughly post himself on all its requirements, by visiting some successful plantation, and also by purchasing some one or more of the works in which the subject is discussed by adepts. A lengthy article on Cranberry Culture appeared in the RURAL for December the 22nd last.

Chufas.

J. M. Butler, Jeffersonville, Arkansas, says: "Our lands off from the river bottoms are what are here termed piney-wood land. The growth of timber is principally Yellow Pine and Black Oak. There are also some Shellbark, White Hickory, and Dog-wood. The soil is light and sandy, and without manure, will produce, on an average for five years, twelve bushels of corn, 250 pounds of lint cotton, or 125 bushels of sweet potatoes per acre." He has never seen the Chufa there, but having noticed several references to it in the RURAL, he inquiries if it would thrive in that latitude.

ANS.—Chufas would certainly do excellently in the above latitude; in fact, hitherto they have been cultivated more successfully about that latitude or a little farther south than elsewhere. It is too late, however, to plant them this year, as the usual season for planting them so far south, is in March or April. On poor piney-wood land the crop is reported to be about 150 bushels per acre, increasing all the way up to 500 bushels, as the land is naturally or artificially richer.

Gilliflowers.

F. G. F., Roxboruogh, N. C., asks whether there is any way to extract the pollen from the double Gilliflower and put it on the single flower, so that the seed from the same might produce a greater amount of the double. He finds that by planting the double and single varieties close together, the cross-fertilization is not very thorough.

ANS.—By removing the stamens of the single flowers, fertilization (if it occur at all) by the pollen from the double flowers will be insured. "Double" flowers are those in which the anthers are changed into petals. If, therefore, the flower is fully double, there is no pollen. If semi-double, pollen can be collected on a camel-hair brush and applied to the stigmas of the pistils of the single flowers. In this case the stamens of the latter should be removed to avoid self-fertilization.

The Harlequin Potato.

Mrs. M. F. McCloud, Beaver Co., Pa., asks whether the Harlequin potato has variegated folisge. She sent for a specimen for her flower-garden to D. M. Forry & Co. of Detroit, but the top is green, just like that of the ordinary sorts; and in answer to a note from her to the above firm, they write back that they sold her the genuine Harlequin variety and made no mistake. She wishes to know whether her opinion, that it should have variegated foliage, is correct; and where she can get a specimen of that kind.

ANS.—We have this variety nine inches high. Every leaf is variegated with creamy-white. Our seed-potatoes were sent to our experimental farm by Messrs. B. K. BLISS & SON of this city, among other things, to be tested. We should suppose that D. M. FERRY & Co. are not a concern liable to send plants or seeds not true to name.

Drying Cows of their Milk.

J. B. T. Wheeler, Kane Co., Ill., having a lot of cows coming in, in early fall, is anxious to dry them off, and asks if there is any preparation which, if applied internally or externally, would do so without injuring the animals.

ANS.—We know of no preparation of the kind. In drying off a cow, it is best to put the animal where pasture is scanty, so that she will have to work hard to pick up a livelihood, and if there is no short pasture on the farm, then the cow should be kept in the yard and fed only on straw for a few days. The animal should be milked every third day to clear out the bag so as to prevent the milk from caking, which might cause injury to, or even the loss of, a teat next year. Many people draw a little milk daily from a cow, to relieve her; but this causes more to be secreted, and prolongs the drying off. For a week before the actual drying off begins, it is well not to milk oftener than once a day. Physicking and bleeding cannot be recommended. Should a cow show any signs of inflamation in the udder, it might be fomented with warm water as hot as the hand can bear it, and give a pint of salts; but the milking out of the liquid will generally be sufficient. The evil following the drying of cows is usually caused by feeding them too well. It is well to notice the udders and teats for a week or two after the milk has ceased to flow, as sometimes one or two of the teats will require stripping. Wild animals often lose their young, yet they come round all right, and with cows the best way is not to fuss too much.

Aphides on Grapes.

J. R. Roselle, asks whether the little brown aphides that are gradually covering the bunches of young grapes, will do any harm and how to get rid of them. He has used tobacco water and soft-soap with good effect on cherry trees and English beans, but is afraid it is too strong for the grapes.

ANS.—These aphides are injurious to the fruit but far more so to the young shoots and tender leaves on which they feed so liberally as to cause the parts they infest soon to wither and die. With regard to the best means of getting rid of them, we have asked ourselves the question every day for the past week. All that we have done is to pinch off the ends of the shoots infested, collecting them in a basket and throwing them into the fire.

Miscellaneous.

J. Halcomb, Hartford Co., Conn., asks for the name of the best work on botany and speaks of the artificial system of Linnæus.

ANS.—The artificial system of Linnæus is not used now. The elementary botany (How Plants Grow), by Professor ASA GRAY, will serve his purpose as well as any.

J. N. Whelmore, Rutland Co., Vt., wants to learn how to prevent mice from eating his harness.

ANS.—Nothing occurs to us that has not probably been thought of by our correspondent. We should naturally reply: hang the harness up out of reach of the mice, or, if kept in a harness-room by the use of sheets of tin, it may be made mice or rat-proof. When our rats get over-troublesome, we use rat-poison.

N. Y. Z., Nineveh, N. Y., having a cow troubled with "snuffles," asks for a remedy.

ANS.—This inquiry is too indefinite to enable us to give a correct answer. When advice is sought, with regard to the maladies of cattle, it is necessary to give a description of the disease inquired about, for not only do names for diseases vary in different parts of the country, but, to prescribe appropriately, it is also necessary to know the condition of the afflicted animal, as well as the disease.

C. E. P., Bay Ridge, L. I., N. Y., sends us a defunct insect for a name, and 1. asks how best to get rid of it. Its living kindred are ruining his verbena beds and destroying his Roses. Though he has scattered sulphur liberally on the plants, it seems to injure the flowers more than the bugs. 2. Lately he found a light-grayish toad, with a streak of gold down his hind legs, and around the eyes, and around the body a few black streaks like those found on marble, and he wishes to know whether it is a specimen of a distinct species or merely a "sport."

ANS.—1. The insect is a Rose-bug, best got rid of by picking them off. Will somebody pested in toads please answer question No. 2.

J. E. F., New York City, asks whether the Leghorns are the best fowls for laying and what breed is the most profitable for marketable young chickens.

ANS.—The White Leghorn is generally considered second to no breed as layers, though Brahmas and Cochins are not without admirers who prefer them. These are also held by most poultry keepers to be as profitable as any for marketing young chickens. A cross between a Brahma cock and a Dorking hen also produces an excellent fowl for market.

C. L. Toppert, Jefferson Co., Ky., asks for an article each on the culture of Peanuts and sweet potatoes.

ANS.—A lengthy illustrated article on the peanut and its culture appeared in the RURAL for Oct. 13, last year. Another on the culture of sweet potatoes will be published soon.

Mrs. M. A. Poppino, Muskingham Co., Ohio, sends flower for name.

ANS.—It is Lilium superbum.

Veterinary

MALADIES OF STOCK.

INQUIRIES ANSWERED BY D. E. SALMON, D.V.M.

Sprain of Horse's Hip.

Alex. Moore, Chickasaw Co., Miss., has a fine mare lame in her left hind leg for twelve months. After working she walks on the tip of the hoof; is more lame going up hill than on level ground. The hip has recently shrunk; the muscles seem drawn up from the stifle to the upper joint; using her makes her much lamer and seems to cause the flesh to quiver between the stifle joint and the point of the hip. He wishes, from this diagnosis, to learn the mare's ailment and its treatment.

ANS.—The symptoms enumerated indicate sprain of the tendon of the glutens maximus muscle at or near its insertion on the trochanter major of the femur. The quivering of the muscles above the stifle is caused by the effort to keep the limb raised and thus throw the injured muscle out of use. In most cases of this kind there is more or less swelling at the point of the hip joint, *i. e.*, over the trochanter major; there should also be tenderness and flinching from pressure at this point. What is known as a high-heeled shoe, should be put on the foot of the affected limb to relieve the strain on the muscles; the joint should then be bathed with hot water (as hot as the hand can bear) several times a day for a week (the oftener the bathing is repeated, and the longer it is continued at each time, the better); the affected part should then be repeatedly blistered with cantharides (cantharides 1 part, lard 4 parts), and if not cured in this way, may be fired. Would advise Mr. MOORE to get Law's Veterinary Adviser, and read up on blistering and general principles of treating lameness unless he has had experience.

Paralysis in Swine.

J. Winans, Crawford Co., Pa., has a barrow hog about fourteen months old, which he intended to kill last Christmas. The animal, however, saved his life by suddenly losing the use of his hind legs just a week before his intended introduction to the butcher. Although he came to the trough dragging his hind quarters after him, his appetite continued first-rate, and at first it was thought that he had merely strained his back and would soon be all right again. As this didn't happen, a neighbor thought it was "kidney-worms" that ailed him, and prescribed a pint of soft-soap in his food once a day for five days. That hog, however, couldn't be soft-soaped into good health. Another neighbor then prescribed a pound of pulverized indigo; but the blue draught didn't make a shade of difference in his condition. Every neighbor all around had a different remedy for the case, but not one of them cured the animal, and, stranger still, all combined failed to kill him. So soon as folks ceased doctoring him the hog began to get better of his own accord, and soon became able to walk about in the pen. When the weather began to get warm, he was let out into a pasture lot, under the impression that the soft sod would be better for him than the hard floor. But here again the treatment failed of its anticipated effects, for in a couple of weeks the animal grew lame again, and is now as bad as when the subject of experimental doctoring. A name and a remedy are sought for the ailment.

ANS.—This trouble may arise from different causes, and it is not always an easy matter to decide in regard to its exact nature; although it is generally ascribed by farmers to kidney worms, this is, perhaps, the least frequent cause. It may be brought on by disordered states of the digestive organs, liver or kidneys, and also by congestion of the spinal cord. It is best to clean out the bowels with three to five ounces Glauber salts, according to the size of the animal; to apply irritants along the back (mustard, oil of turpentine, ammonia); to give soft, easily-digested food, and to keep the bowels in a laxative condition, by giving one to two ounces of salts daily. If not successful in ten days, this may be followed by nux vomica, in five to ten-grain doses, twice a day. Do not allow access to stagnant or muddy water, or musty food of any kind.

Parturition Fever.

W. H. Keplinger, Tuscarawas Co., Ohio, says: "Within the last few weeks, among our farmers and especially our dairymen, quite a number of cows in good condition, and aparently in good health, have died soon after dropping their calves. Nearly all seem to clean or pass the after-birth all right. In from ten to twenty-four hours after calving, the horns are found to be cold and hollow. The cow is unable to remain on her feet and becomes very weak and tender in the small of the back or across the kidneys. The spine, in the region of the kidneys, is quite hot, and the points of the hip are cold in some cases. The cow at once becomes helpless and lies down all the time, showing by her repeated turnings of the head toward the sides and hip, and her constant moaning, that she is suffering great pain. The nose at times becomes very dry, and at others breaks out in a cold, clammy sweat. The animal generally lives from one to three days after getting down—only a few recover. I would like to know what is the cause and the remedy, and if there is a way to treat the cow before calving to prevent the attack of this fatal disease?"

ANS.—This disease is known as milk fever, parturient apoplexy, parturition fever, etc., and is quite frequent in cows which have been fed too well before calving. The condition of the horns has nothing to do with the causation of the disease; it would seem that after boring the horns of cattle in all manner of diseases for over a century, our farmers would finally find out that the horns of all the cattle are naturally hollow after they reach maturity. Cold horns, hips and limbs are merely symptoms of serious internal disease. The trouble may be prevented by keeping the cows on *very spare diet* for ten or twelve days before calving, and for a week after. Treatment has never proved very satisfactory even in the hands of veterinarians. If the disease is recognized while the cow is still on her feet, and while the pulse is full and hard, she may be bled to the amount of four or five quarts; after this period bleeding is injurious. Give as medicine two pounds of Epsom or Glauber salts dissolved in warm water; just before administering, add to this half an ounce of carbonate of ammonia and half a drachm of nux-vomica (powdered), and repeat the ammonia and nux-vomica three times a day. A weak solution of carbolic acid injected into the uterus, two or three times a day, is of considerable assistance. Keep the milk drawn from the udder and apply bags of pounded ice to the head.

Red Water.

M. B., Andover had a cow taken sick. Her water and milk were part blood; she soon lost her appetite, milk and strength, and died three days after the beginning of the attack. He asks the name of the disease, its cause, and best treatment.

ANS.—This affection, which is known in Europe as *wood disease*, only occurs where cattle pasture on unimproved lands, *i. e.*, in woods and uncultivated meadows. It is said by some to be caused by various irritant plants (Ranunculus, Colchicum and Asclepias). It is also said to be caused by eating the branches of resinous

trees, while still others claim that even roots, grass, etc., grown on certain undrained soils, will produce it. As prevention, keep the animals from unimproved pastures till the grass is well started, and feed on sound, bright grain and fodder, free from acrid weeds. As medical treatment, give a purgative (Glauber salts, 2 lbs; ginger, 2 ounces); or, if there is colic and other signs of an irritated condition of the bowels, the treatment must be restricted to a laxative, such as olive or linseed oil. If signs of weakness and sinking are shown, give diffusible stimulants (sweet spirits of niter) and tonics (tincture of iron); food should consist of gruels and other easily digested substances.

Fistula in Horses.

W. Wright, Benton Co., Mo., having already lost a couple of horses by fistula, is naturally anxious with regard to another now afflicted with the same disease, and asks for a remedy.

ANS.—The great point in treating fistula is to make an opening from the lowest part downwards to the outside to allow the pus to escape; in such cases a surgeon is almost indispensable. A probe must be introduced into the tubes or sinuses, which are often three to six inches deep; the probe must then be cut down upon at its lowest point, and a seton inserted to keep an opening below till healed above. The wound should then be dressed once a day, and an astringent solution applied; this may consist of acetate of lead ½ drachm, water ½ pint, or acetate of lead and sulphate of zinc, of each ½ drachm, and water ½ pint.

Scientific and Useful.

COMPOSITION AND DECOMPOSITION.

S. RUFUS MASON.

THE title of this article indicates the two powers or forces which are the primary causes of life and death. All creation is governed by them; they are the beginning and ending of all things. I propose to consider their influence and action in the vegetable kingdom, in the interests of the cultivator, and to show that unless it is well understood and taken advantage of, no crops can be grown successfully, except by accident or by fortuitous seasons.

Composition is that property by which every living thing grows up to its maturity; and decomposition is the process commencing at maturity, which finally reduces it to its first principles. As animal life is forced into activity and motion by a chemical combination, and then begins to form or compose itself with the aid of food, warmth and moisture, so the vegetable embryo, its energies awakened by the chemical action of heat, light and moisture, at once begins to compose or form itself into the adult plant, producing, in time, the seed or future embryo. This is the first phenomenon of life.

Decomposition, or death, is the destruction, by a natural process, of the adult plant, the final end of that particular embryo, as far as its increasing period of life extends, and this is the last phenomenon of life.

Composition is the result of a close affinity between the embryo and the surrounding influences necessary to it, and decomposition is the result of a gradual decline of this affinity, produced by the natural changes of the season—heat changing to cold, light decreasing in intensity, and moisture giving way to autumnal drought. These are the principal agents, and the active principles of life and death, and it is evident that to insure a perfect life, all the attending circumstances must be not only in harmony with each other, but particularly so with the embryo to be acted upon.

In reality, there is no such thing as death, but in place of it, only a cessation of growth or increase, passing to a decrease of bulk and into another form of life called destructive fermentation, ending in the living body taking the form of food suitable for a new living body, and this is Nature's mode of maintaining the fertility of the earth.

We see, then, that without life there can be nothing to die, and without death, no food for the living. These processes are simple, regular in their action, necessary to development, and form the fundamental principles of the laws of nature. They cannot be evaded without certain punishment, but they can be improved by the farmer, always to his profit. As all plant life in nature is governed by these laws, it is evident that modes and times of tillage must conform to them, and that if decomposition is also conducted in accordance with the same laws, the produce of the land can only suffer from violent or untimely changes of the atmospheric influences. Chemical action begins only when all the agents act in unison, and natural growth is always due to the uninterrupted influence of all the agents. Any irregularity of either one not only deprives the plant of that special influence, but checks the effect of the others.

Here we notice the secondary laws; and these again are governed by all the different qualities, conditions and fitnesses of the soils, as well as by the conditions of the atmosphere. No two crops demand exactly the same amount of the essential elements, and thus we see the necessity of a perfect knowledge of each one's habits. The seed, the average amount of heat, light and moisture, and the length of the season, are fixed; the farmer has no control over either; but the soil, its fitness, its preparation and its condition during the season, are entirely under his control. As to the soil, its good qualities must be utilized, its bad ones corrected by cultivation and enrichment, while even the amount of light, heat and moisture may, to a certain appreciable extent, be increased or decreased by close or distant planting, or by deep or shallow cultivation. Here is the measure of the farmer's brain capacity and skill.

From the germination to formation of seed comprises the first stage of composition, and if carried through successfully, has allowed no signs of decomposition or death, such as dead leaves. After gathering the crop, the next duty of the farmer is to prepare for a regular and thorough decomposition in time for the next crop. This final act of the season takes place under precisely the same influences as composition, but in a vastly diminished degree of intensity of each. It is the most important work of the season—the preparation of food for the land which has become weakened by its efforts in growing food for the farmer.

Again the laws of nature assert themselves, as food is only beneficial when properly prepared and timely administered. These agents of plant growth never cease their action upon vegetable matter, and as we have no other tools to work with, it is of the last importance to know how to handle them. As composition and decomposition are active alternately—one in the growing, and one in the season of comparative rest—they never interfere, thus giving the farmer ample opportunity to assist both.

A study of the subject will prove that nothing dies; that what is called death is merely a a change from the composition of fruit and seed to the composition of manure, and that these processes are absolutely necessary to accomplish two purposes: one, that of preventing the earth from being encumbered with dead herbage; and the other of changing it to plant-food. Thus nature, always in a state of preparation, admonishes the cultivator of the soil to "go and do likewise."

Entomological.

GETTING RID OF THE CUT-WORM, &C.

B. PICKMAN MANN.

ON page 341 of the RURAL NEW-YORKER, Joslyn's method of getting rid of the cut-worm is said to be "just about as sensible as many methods of destroying insects which are published in these enlightened days," which kind of comment has the appearance of indicating a contempt for the method, but on page 266, in an answer to a correspondent, essentially the same remedy is recommended as the only one known.

In an answer to a correspondent on page 266 of the RURAL NEW-YORKER, the respondent says, referring to *the* cut-worm. "We presume our inquirer refers to *the* greasy, ash-gray caterpillars that cut off young plants during June and July." (The emphasis is my own.) May I ask which is *the* cut worm? Is it what Mr. RILEY calls the "Variegated cut-worm? (Agrotis inermis), or is it the "W-marked cut-worm" (Noctua claudestina), or the "Greasy cut-worm" (Agrotis telifera), or the "Western striped cut-worm" (Agrotis herilis), or the "Dingy cut-worm" (Agrotis subgothica?) all of which are distinct kinds of "greasy, ash-gray caterpillars that cut off tender young plants during June and July." Will farmers and gardeners soon learn that it is no more sensible for them to ask what to do with *the* cut-worm or *the* current-worm or *the* wire-worm or *the* potato-beetle or *the* weevil than to ask their physician what do for *the* fever or *the* headache or *the* indisposition? In Mr. GROTE'S last list of the moths known to entomologists as Noctuidæ, over two hundred and fifty different kinds of what may generally be called cut-worms are named.

I think it is a pity, considering the dense ignorance of entomology which still exists in many minds, to rely upon the power of irony alone to combat such absurd recommendations as those given for "Death to the curculio" on page 268 of the RURAL NEW-YORKER. There can hardly be any doubt that very many of the readers will recognize as readily as the editor does, this absurdity, yet it is made plain by a sad experience that recommendations no more sensible find acceptance in many minds, if they are not plainly discredited at every turn. See rather the remarks upon the curculio on page 248.

On page 162 I referred, in a partial answer to J. J. D., to some valuable observations made by Mr. WALTER FAXON upon the injury caused to hides by certain mites. I have just received from Mr. FAXON a copy of his article, which is published as No. 2 of vol. 5 of the Bulletin of the Museum of Comparative Zoology, at Harvard College, Cambridge, Mass. This comprises six pages, beside a plate and a page of explanations, and is entitled: "On the presence of Demodex folliculorum in the skin of the ox." "In the parts about the neck and shoulders, especially, the skins presented numerous slight swellings, which under pressure emitted a quantity of soft, whitish matter. After being tanned and split, the leather appeared disfigured with pits which in many cases penetrated nearly through the thickness of the leather." These cavities were found to be immensely enlarged, and they were filled with a fatty substance containing multitudes of the same mites which live in the little black-headed, worm-like masses that may be squeezed out of the face of a man, woman or child. The same mite is found in the skin of the cat, dog, fox, bat, ox, horse and sheep, and perhaps occurs in animals generally. In dogs it causes the mange. It is not known whether it makes hair fall from the skin of the ox or not. Fresh specimens of skin, preserved in rum, alcohol or whiskey, are needed to determine this question. The method of treatment is described.

Everywhere.

RURAL SPECIAL REPORTS.

HARRIS CO., Texas, June 16th, 1878.

THE severe drought we have had here ever since early spring, has been terminated by plenty of very heavy rains. Sweet-potato planting, which had to be delayed on account of the dry weather, is being pushed rapidly. There is a general want of plants and slips this year, which will, to a certain degree, limit the area of this crop, usually so sure and remunerative. Tomatoes and water-melons are plentiful; the drought caused the latter to be smaller than usual. Peaches are mostly curculio-stung and rotting on the trees. This fruit does not succeed as well as in former years, down here in lower Texas. Grapes are ripening. The mocking birds and other members of the feathered tribes are in for their lion's share.

In flower-gardens Crape-myrtles are in full bloom; so are the Althæas and Hibiscus mutabilis. I never have seen these two last-mentioned plants bloom so soon in the season, as they are properly fall-flowering. The Mignonette tree is loaded with flowers which shed their powerful perfume profusely. It is a pity that this shrub is not entirely hardy here. Perennial Phloxes exhibit their flower-trusses; they are not so plentiful in flower-gardens about here as they deserve to be, being comparatively little known and owned only by a few. Dahlias, too, make a fine show, after those few rainy days. They are apt to deteriorate in this climate, especially in a strong and heavily-manured ground. It is preferable to raise new tubers by cuttings every year, than to save the old ones; which latter get, on account of the long season, overgrown, carious and inclined to rot, producing flowers inferior both in color and fullness.

G. MARTI.

RURAL FARM, June 29.

THE hottest day of the season. Men have been obliged to quit the fields and to keep quiet under the shade of trees. During such "heated terms" it is wise to do all the work that can be done before the sun has full power in the morning, or to wait until the cooler part of the afternoon. To work through the heat of such days is the poorest kind of economy and results too often in sickness and death.

CEDAR MILLS, Meeker Co., Minn. June 14 1878.

CROPS of all kinds are looking very well, indeed, especially the small grain which never looked better. Some fields are heading out already, and an early harvest is expected.

We have been having an abundance of rain for the last four weeks. Immigration is pouring into the State at a rate never before equaled, and still there is room for more. Everybody seems prosperous and happy, and times are better than for several years.

M. E. B.

WARREN CO., N. C., June 10.

THE oldest inhabitant says, "We never had so cool a May and so far in June." We can rake and bind our fifty dozen of wheat, with "nary" a perspiration. Wheat is fine, the rust caused but little loss. Cotton is doing nothing. A good stand, July and August, may make a crop. Severe storms of wind, rain and hail have done considerable damage to fruit and other crops in some localities, some fields of wheat being literally threshed in the field. M. B. PRINCE.

POUGHTOWN, Chester Co., Pa., June 27, 1878.

WE are busy making hay which is a large crop. Wheat will be cut this coming week; it looks well and so do oats. Fruit will be a short crop. Hay sells at $6 per ton; wheat, $1.15; corn, 60c. per bushel; butter, 18c. per pound.

DR. HAINS.

DE RUYTER, Madison Co., N. Y.

I HAVE a hive of bees from which have issued four swarms within the thirteen days past.

THE

RURAL NEW-YORKER.

PUBLISHED EVERY SATURDAY.

Address RURAL PUBLISHING CO.,
78 Duane Street, New York City.

SATURDAY JULY 6, 1878.

MANY of our old subscribers have written to us requesting that we would sell them the Cricket Clock. Others have complained that the offer (now withdrawn) was of advantage only to new subscribers. In order to satisfy all so far as we are able to do so, we have now the consent of the manufacturers of the clock to offer it to our subscribers—*and to them only*—until the 20th inst. at $1.75 each, delivered to the express office.

INDIVIDUALITY AND SELECTION.

NONE of our readers needs to be told that there are no two animals, even of the same breed, exactly alike—the fact is so apparent that it fails to excite either the interest or study which its importance would seem to warrant, for if we are not mistaken, these individual differences may and should, be made the basis for a great and rapid improvement of our live stock. It is not to external characters alone that we refer, but rather to internal functions, the activity of which decide the profit which an animal is to bring to its owner. With the same food, the same ration, the same surroundings, one of several animals will digest a large per cent., another will make more live weight from a given amount digested, and still another will furnish a greater proportion of dressed carcass. Of a given number of cows under the same conditions, one will be conspicuous for her large yield of milk, another for the quantity of butter which she produces, and still another for the amount of casein. Consequently, among a given lot of animals we find some that are very profitable, others that scarcely pay for their keeping, and still others that are a source of certain and continual loss.

If a merchant finds that he is paying more for a certain line of goods at one house than they can be bought for at another, he would be considered an incompetent business man if he continued to buy at the former establishment; it is a part of his business to get his goods at the lowest market price, and inattention in this respect often makes the difference between success and failure. And is it any less the business of a farmer to see that he gets his butter and cheese, his wool, beef, mutton and pork from such animals as furnish it at the lowest cost? It is self-evident that the greatest profit from animals can only be made by those who know at what price each one furnishes its products, who are particular to keep only the most profitable individuals, and who understand and practice the most certain methods of obtaining such animals.

It is not necessary to keep an intricate system of accounts to discover the profits yielded by individual animals, nor does it involve serious labor. In almost every farmer's family there is some young person who would be interested in keeping a record of such experiments, and to whom the experience thus obtained would be of immense value in after years. If the relative profit of the cows in a butter dairy is to be determined, the food of each should be carefully weighed and measured, and their milk, for a certain number of days, churned separately. It is then an easy matter to compute the butter yielded per day, the cost of food per day, and the cost of the butter per pound. Of course, the time since calving should be taken into account, and the mistake should not be made of limiting all the animals to a determined quantity of food, for butter is not manufactured from air, and it is those animals which have the capacity to eat, digest and transform the *greatest quantity* of food, which are the most profitable.

Our breeding stock, above all, should be selected according to such principles. If breeding mutton-sheep or hogs, lambs and pigs should be regularly weighed once a month, and their weights recorded; if it is a ram or boar that is to be selected, we should, when they are from one-half to two-thirds grown, in addition to the above weighing, select three or four of the most promising, weigh their food, and determine the actual gain for a given quantity of food. We may rest assured that by following this plan we will soon have a uniform flock or herd, and one that is capable of making the most of the conditions to which we subject them; and no one can doubt that the profit from animals bred in this manner would be far in advance of what it would have been had no such care been practiced.

This is practical selection. No farmer can afford to neglect it; and its general adoption would make an incalculable addition to the value of our animals, and to the profits of our agriculture—an addition that would make all the difference between an unremunerative business on the one hand, and a highly profitable one on the other.

CROP PROSPECTS.

"WHAT will the harvest be?" is at all times an interesting question to the farmer; but especially so at this season when the attention paid to the gathering of the crops in each section, naturally begets a desire to know their condition elsewhere. Agricultural statistics collected from every part of the country give ample data for an approximate estimate of the yield of the various crops during the present year.

Of the 120 million acres under the plow in the United States, 30 million acres were sown to wheat this year, an increase over the area sown to wheat last year, of fifteen per cent. for winter and eighteen per cent, for spring wheat. Of the entire yield from this area, about four-fifths are produced by twelve states, namely, Minnesota, Iowa, California, Missouri, Kansas, Wisconsin, Ohio, Illinois, Indiana, Pennsylvania, Michigan, and Tennessee. A medium crop from 30 million acres would be 360 million bushels; but the present will be more than a medium crop. At thirteen bushels per acre the yield would be 390 million bushels, and probably it will not fall short of this amount. But placing it at the low figure of 350 million bushels, 45 millions will be needed for seed, and 235 millions for home consumption, leaving a surplus of at least 70 millions for exportation.

Of corn, the great cereal crop of the country, there are under cultivation nearly 50 million acres, or about four-tenths of all the arable land in the nation. Of this area Illinois alone has nine million acres and Wisconsin five millions. It is too soon yet to predict the yield of the present crop, but out West much of that planted early, rotted in the ground, or if up before the advent of storms and frost, a great deal of it has suffered severely, particularly on heavy soils, on which much of it is stunted and yellow. On the better drained lands, however, and on those well cultivated, the growth is vigorous and the outlook highly promising. In the South, also, a larger area than usual has been sown to corn, and there an early and very favorable stand has been obtained. While the average relation of the yield to the exportation of wheat is about twenty per cent., only from three to five per cent. of the corn produced here is exported, and the price of the latter, therefore, depends much more directly than that of the former on the ratio between domestic demand and supply.

The impetus given to cattle feeding, by the exportation of meat and live stock, will do far more towards keeping up the price of corn than any increase in the exportation of maize or corn-meal, although this too has been slowly augmenting. This increase, however, is scarcely desirable, as it can never amount to any considerable part of the crop, and there is greater profit, and much greater farm economy in the shipment of meat, lard, cheese, butter, wool, and other concentrated products of maize, than in the exportation of the grain itself. Since 1860, the area under corn has increased twenty million acres, and this year the prospect is for a fair rather than for an unusually good crop.

The area under oats is greater than that under wheat, and stands next in extent to that under corn, while the annual value of the crop amounts to 100 million dollars. Its cultivation is constantly increasing, and about ten per cent. more land has been planted to it this year than last, mostly in the West and South. Farmers, in many places, have been cautious about cultivating this cereal on account of its liability to rust, but of late years, by obtaining the principal growth in winter, harvesting it early, and especially by carefully selecting acclimated, hardy, rust-proof varieties, this liability has been to a great extent avoided. The crop this year has, on the whole, been free from serious injury from rust or insects, and will be above the average.

Of barley, California produces nearly one-third of the crop; New York comes next, and in this State as well as in Illinois and Iowa, the prospects for a large yield are not favorable, while in Minnesota, Kansas and California the yield will be above the average.

The prospects for an average crop of rye are fair—but little importance is attached to this product.

The great yield of tobacco last year depressed prices so much that a smaller area has been this year planted to it, especially in the Ohio valley. The weather has not been generally favorable to transplanting the "weed," as heavy rains have interfered with the work. Still, the prospects for a remunerative crop are fair, as the decreased crop will tend to increase prices.

The area planted to cotton is about three per cent. greater than in 1877. The crop was put in early; came up well; was promptly brought to a stand; is, on the whole, cleanly cultivated, vigorous, and in better condition than at this time last year. In North Carolina and Tennessee, however, the weather has been too cold, too much rain has fallen, and the crop is, therefore, somewhat backward, but is rapidly improving.

The late frosts in May seriously injured the fruit crops in many places, so that, on the whole, the prospect in this direction is somewhat unfavorable; still late advices indicate that the damage done is less than at first anticipated.

AN OVERSIGHT.

OUR excellent contemporary, the Maine Farmer, speaks of "An English Recognition of American Agriculture," and refers to what Mr. J. B. LAWES, the great experimental farmer of Rothamsted, England, says of our wonderful changes in agriculture. But it gives the London Farmer credit for the long article from which the editor of the Maine Farmer takes his notes. The article in question was copied from the RURAL NEW-YORKER and duly credited by the London Farmer. See RURAL, April 6. We are surprised, first, that our contemporary did not read the article in this journal, and, second, that it did not observe the credit which the London Farmer gave to us.

BREVITIES.

THE best vegetables for undrained lands—Leeks.

"THE true investigation of Nature leads to God."

How would it answer to call the report of the Potter Committee "The Book of Revelations?"

RURAL GROUNDS, June 30.—The ground is moist — the weather hot. Melons grow like weeds and corn's in clover.

THUS far we have to report that Pearl Millet promises to be a failure with us, but the promise may be broken later in the season.

THE last roes of Summer, is the appropriate melody for the June shad as she penetrates into shallow places to perpetuate the species.

AND now by the aid of the microphone the pleasing hum of the mosquito will sound like the roar of a buzz-saw. The advantage of it is to stop emigration to New Jersey.

IN setting out late cabbage plants, it is better to twist off the outside leaves, leaving only the central ones. They cause needless evaporation, and delay the plant's growth.

MR. A. B. CRANDELL answers a friend who inquires whether wheat will turn into chess, in the affirmative, and even gives the time when the change takes place, viz.: when two Sundays come together.

SEEDS of Rutabagas or Swedes may still be sown. A pound of seed is enough for an acre. Sow in drills two feet or more apart, according to the richness of the soil, and thin out to ten inches in the drill.

WE hope, after all that has been said upon the subject, that farmers will take pains to select the best corn for seed. The suggestion to plant a plot by itself for seed, removing all weakly plants or cutting off the tassels before the pollen ripens, seems worthy of general trial.

LAST week it was stated in the Notes from the Rural Grounds that the plums (save one) of two plum trees were not attacked by the Curculio upon which our insect preparation had been used. We have now to state that many of the plums have been attacked. We merely stated what seemed a fact at that time, which has since proved otherwise. The Curculio *is* a little rogue! But we still contend that the mixture, prepared and applied as directed, is excellent for the other insects.

IT is usual to plant three or four times as many melon seeds in a hill as would be needed if all were to grow, so as to provide against the destruction of the cut-worm. As soon as they are out of such danger, it is better, as we have stated, to cut off at the surface of the ground with a pair of scissors, the plants not needed, than to pull them up as is the common practice. It does not disturb the roots of those which remain. On the contrary, the decaying roots afford, no doubt, an appreciable amount of food.

Now is a good time to begin the propagation of hardy shrubs by layering. Select the lowest branches, strip off all but the terminal leaves and ascertain by bending the stem where it will bury in the ground. In that place scoop out the soil as if to insert an earthen bowl—bend the branch into it and while holding it down, cover it with enough earth to keep it in place. Remove the other hand and fill in compactly. No forks or anything of the kind will be needed. Next spring the layer will be found well-rooted and may be transplanted where it is to remain.

FOR Tomato-stakes we use stems of young trees varying from one to two inches in diameter the larger end wedge-shape so as to enter the ground more readily. These we provide from the woods during the winter. Three, set triangularly and diverging upwards, suffice for each plant. Cheap, coarse cord is then tied about these stakes horizontally as the growth of the plants renders it necessary. Some support of this sort is indispensable in a well-kept garden, and we have found the above as simple and effectual as any other.

PROBABLY the Green Prolific Cucumber is the best variety to plant now for winter pickles. Beans, if picked when one-third grown, make excellent pickles and may be preserved in brine, the same as cucumbers to be pickled in vinegar, at any time during the winter. For this purpose the Golden Dwarf varieties are among the most tender. Asparagus, the tender shoots of Brussels-sprouts, Broccoli, young beets, and even those of the Chinese Yam, are all available for pickles. Young tomatoes, an inch in diameter, and Strawberry Tomatoes, make fine pickles, and may be placed in jars the same as canned fruits.

IN the garden, old pea, or worn-out strawberry beds may be manured and prepared for celery, a vegetable that farmers would do well to cultivate a hundred times more than they do. Trench-planting is not so much in favor as in years past, many preferring to use dwarf varieties, setting them on the surface and earthing up later. In Washington Market, New York, the dwarf varieties are sold almost entirely. The leaves and outside green stalks are cut off, leaving only the white, tender parts of each root. Retail purchasers prefer them thus prepared. They are more easily carried and are, after washing, ready for the table.

WE would impress it upon our readers that if poultry-runs and houses ever require care, they require it during the hot season. Our largest poultry-house has a cement floor. As often as twice a week the droppings are hoed into a heap, thrown into barrels and covered with a little earth. These are removed when filled. As often as every two weeks kerosene is poured through a fine nozzle along the perches and into all crevices where vermin accumulate. A small quantity of sulphur is sometimes mixed with fine coal-ash siftings for dusting baths. It is a good deal of trouble to give poultry the steady attention which they need at this season. But if it pays to keep poultry at all, we are confident it pays to give them this unremitting care.

IT is folly longer to talk of the "dreaded potato beetle." The notes we have published from time to time, for the most part in jest, partly in earnest, that it was really the poor man's friend and had done more than anything else for potato culture, are not without a smattering of truth. The potato beetle is an indolent and a stupid enemy, and by a united action on the part of those who raise potatoes, could be substantially wiped out in a single season. Speaking for ourselves, plant-lice (Aphides) have pestered us more than any other insects, and more the present season than ever before. Every growing shoot of every Cherry tree is alive with them. The leaves become blackened, curled and dried up. It is so with Plums and Apples and many ornamental trees and shrubs.

Literary Miscellany.

WHEN YOU WERE SEVENTEEN.

JOEL BURNS.

When the hay was mown, Maggie,
In the years long ago,
And while the western sky was rich
With sunset's rosy glow,
Then hand in hand close-linked we passed
The dewy ricks between,
And I was one-and-twenty, Mag,
And you were seventeen,

Your voice was low and sweet, Maggie,
Your wavy hair was brown;
Your cheek was like the wild red rose
That showered its petals down,
Your eyes were like the blue speedwell,
With dewy moisture's sheen,
When I was one-and-twenty, Mag,
And you were seventeen.

The spring was in our hearts, Maggie,
And all its hopes were ours;
And we were children in the fields,
Among the opening flowers.
Aye; life was like a summer day
Amid the woodlands green,
For I was one-and-twenty, Mag,
And you were seventeen.

The years have come and gone, Maggie,
With sunshine and with shade;
And silvered is the silken hair
That o'er your shoulders strayed
In many a soft and wayward tress—
The fairest ever seen—
When I was one-and-twenty, Mag,
And you were seventeen.

Though gentle changing Time, Maggie,
Has touched you in his flight;
Your voice has still the old sweet tone,
Your eye the old love-light,
And years can never, never change
The heart you gave, I ween,
When I was one-and-twenty, Mag,
And you were seventeen.

CORA.

CHAPTER XXX.

(Continued from page 414.)

MEANWHILE, Cora and Lady Lucie Belmont had driven rapidly from one fashionable shop to another in search of wedding finery and presents, for Mrs. Colston's favorite niece was about to be married, and the heiress was pleasing herself in making the young people happy by loading them with all kinds of ornamental and useful gifts.

"I have so much money, Cora," she said, half-sadly, half-jestingly as they drove away, from one great *magasin*. "If I do not use some of it, and make other people happy, of what good is it? You were a happy girl not to be an heiress, Cora; it must be so pleasant to be loved for one's-self alone."

"But is there any reason that you should not be loved for yourself, Lucie?" said Cora, smiling. "And it would be so pleasant to make anyone you cared for rich. I should not have imagined that Alan had married me for money if I had been ever so rich."

"A burnt child dreads the fire, Cora," said the heiress, still a little sorrowfully. "I am inclined to put faith in the old saw: 'Men are deceivers ever.'"

"Not all, dear Lucie."

"Of course not all, Lady Vincent," laughed Lucie, patting her companion's hand lightly with her own. "There are bright exceptions; my friend, Sir Alan Vincent, for instance."

"And my friend, Mr. George Leeson," said Cora, smiling; and, giving Lady Lucie a sly glance, she saw the color deepen on her cheek.

"He too," said her ladyship, quietly, "I believe him to be loyal and true. Here we are at Marshal's, Cora; come and tell me whether you think *ecru* or moonlight-blue will look best for my dress; that is a more interesting subject than mankind for you and me!"

When Cora returned home she found that Sir Alan was there before her, and he came out to assist her to alight. Lady Lucy would not get out, as she was anxious to dispose of the numerous parcels with which the back seat of the carriage was covered, so that if Mr. Leeson expected to see anyone but his hostess when he came in to afternoon tea he was disappointed; and it was, I suppose, the disappointment which made him quiet and absent while Cora and her husband discussed Mr. Marks.

"I always thought we had met before," said Lady Vincent. "You remember, Alan, I told you I was sure there was something familiar about him; that momentary anger of yours almost cost you dear, Alan."

"It cost me very dear, my child," he said. "It seems very awful that a man should cherish revenge so long and bide his time. In my opinion it was not so much his revenge as his advantage that he sought."

"I suppose he quieted his conscience with the idea that he owed you some retaliation," said George Leeson, as he rose to take leave. "But directly Lady Cora told me her story, I felt sure that Marks had something to do with it, and Lady Lucie and myself have long been on the lookout for him."

"How can I thank you for your friendship?" said Cora, in a low tone, as he bent over her to say good-bye. "Can I do anything for you, Mr. Leeson?"

"Yes," he said eagerly. "Say a good word for me——" Then he broke off, sighing heavily. "No, it is better not. It would be impossible."

And with these disjointed words he departed, mentally anathematizing the cruel fate which had made Lucie Belmont an heiress and himself a painter with a small income.

CHAPTER XXXI. AND LAST.

The marriage of Miss Andrews, Mrs. Colston's niece and adopted daughter, was celebrated at the Brixton mansion, with all due *eclat*. The crimson drawing-rooms were decorated with flowers; the breakfast offered to the wedding guests was of the most expensive and *recherche* description, taxing Mr. Gunther's resources to the utmost. Mrs. Colston herself was conspicuous in ruby velvet and cameo ornaments, and the little fair lady in *ecru* satin and lace, whom many of the guests hardly noticed at all, turned out to be Lady Lucie Belmont, the great heiress, whose name headed the list of names in the newspaper report the following day.

When the bride and bridegroom had driven away and the guests had departed, Mrs. Colston and Lady Lucie returned to the drawing-room, and sat down to talk over the happy event, while they waited for the return of Lady Lucie's carriage, which had taken the newly-married couple to the station, where, it is to be hoped, the officials were duly impressed by the powdered servants and dashing grays.

"I think all went off very well, my dear, don't you?" said Mrs. Colston, as she gave a satisfied glance at her handsome, portly person as it was reflected in the numerous mirrors hung round the room. "Emily behaved beautifully, did she not?"

"All was very nice, Emma," answered Lady Lucie's gentle voice. "I hope they will be happy."

"I wish you would stay and dine with me, dear Lady Lucie," pleaded Mrs. Colston. "I shall feel so lonely to-night. Emily was so bright and cheerful."

"I would with pleasure, Emma," replied Lady Lucie, "but I promised Lady Cora Vincent that I would spend the evening with her."

"Ah! poor Lady Cora! How is she now? Is she bearing her trial more resignedly?"

"She is bearing it well," said Lady Lucie, a little coldly; "but it was a bitter one. Her husband's love is a great consolation to her."

"I suppose so. Do you know, my dear, I always fancied, I may have been wrong, that she did not care much for Sir Alan."

"Why did she marry him, then?"

"Oh, she was flattered by his preference, and pleased that such a distinguished man should——"

"You are quite mistaken, Emma. I know that Lady Cora has been, and is, most sincerely attached to her husband."

"Well, perhaps so. At any rate, my dear, he was not her first love."

"Few of us marry our first love," said Lucie, smiling. "I agree with the poet, who says 'that the last love's the best.'"

"Still I don't think she behaved well during her stay here," persisted Mrs. Colston.

"I am glad you have mentioned that," said Lucie, quietly, "as it gives me an opportunity of setting you right on that point. Before Lord Almane left London he wrote me a letter, telling me of Cora's complete innocence with regard to him. It is true that he loved her, and unaware of his engagement, she returned his love; but directly his relations with me became known to her, she refused to listen to any more protestations, as dishonoring to herself as well as to him. I am glad to be able to tell you this, Emma, because I think you were a little unjust to Cora."

"Will you tell her that I am sorry that I misjudged her?" said Mrs. Colston, readily. "It was for your sake that I was annoyed, Lucie."

"I know that, dear Emma," and Lady Lucie rose and put out her hands in farewell. "I will tell Cora, and now I must say good-bye. There is the carriage, and it is late already."

It was a very quiet party of four at Sir Alan's that evening, but none the less a happy one. Cora was at the piano, trying over some new songs and singing some old favorites, while Sir Alan leant over her with lover-like tenderness, and mingled his rich deep notes with her sweet contralto.

Lady Lucie, in her dainty dress of *ecru* satin, her ornaments of pearl and diamonds, looked very fair and sweet; and George Leeson, from his seat at her side, watched her with very tender eyes, and wished that the satin and lace were cotton and braid, and that the pearls and diamonds were not in existence. In his eyes she was no longer what he had called her to Harold Sinclair—"a pretty creature, but rather insipid;" but the one woman in the world—"a daughter of the gods most divinely fair," his ideal of all that was sweet and true, and womanly. What had wrought this change, when to all other eyes Lady Lucie had not improved? She was thinner and paler, and the sweet rose-bloom had fled. Simply that George Leeson loved her—loved her with all his heart; yet loving her, would not speak, would not tell her so, because she possessed these broad acres and that long rent-roll which had tempted Stanley St. Roger in the past, and had made poor Lucie doubtful and mistrustful in the future.

And she! did she guess the love she had inspired? I think she did, I think she must. No woman can wilfully remain in ignorance even if the man who loves her keeps silence. Now, as she sat there in Cora's pretty drawing-room, she felt the earnest gaze of his eyes fixed upon her, and she knew that the color would rise in her cheeks and would not be prevented, and that her voice when she spoke would have a little nervous tremor, so she kept silence and held her peace; and George, thinking he had offended her, kept silence too; so that they sat apparently calm and appreciative listeners to the music, but in reality restless and ill at ease.

"You are silent, Lady Lucie," he said, at length.

"I was about to make the same remark," she replied. "Is anything wrong with you, Mr. Leeson?" she added quickly, as he sighed.

"Wrong? No; unless it be wrong to long for things out of one's reach," he said, with a bitter sadness.

"Have you tried to reach them," she said, in a low tone. "Most things are attainable if one tries long enough. Don't you remember the Italian proverb, which says that 'he who would be Pope must make up his mind strongly to be Pope, and he will attain the triple tiara at last.'"

"Would that wishing could do it!" said the artist, a little less mournfully.

"Nay, there must be action as well," she answered, gaily, but in a troubled, uncertain voice.

Softly rose Cora's rich tones, filling the room with melody; and the words she sang, set to a quaint old melody, were these:

"I knew that this was life—the track
Whereon with equal feet we fared;
And then as now the day prepared
The daily burden for the back.

"But this it was that made me move
As light as carrier-birds in air.
I loved the weight I had to bear
Because it needed help of Love.

"Nor could I weary heart or limb,
When mighty Love would cleave in twain
The lading of a single pain,
And part it, giving half to him."

As the rich tones died away, Cora lifted her eyes to Sir Alan's, and he bent over her with a tender gesture and loving words, whose import might be guessed if they themselves were unheard. With a stifled exclamation, George Leeson rose and walked away into the conservatory, a spasm of pain passing over his face. Lady Lucie sat still for a few moments, then Cora rose and came over to her, smiling.

"Has my song driven Mr. Leeson away, Lucie?" she whispered. "Will you not call him back? Dear, I think you care for him; he is too proud to tell you how deeply he loves you."

"Do you want me to take the initiative, Cora?" was the half-laughing, half-tearful answer, as Lucie hid her burning cheeks on Cora's shoulder.

"No, dearest, of course not; I only want you to give him enough encouragement to prevent him giving way to despair."

And Cora flitted back to the piano, where Alan had replaced her, and stood watching him as he played. A few minutes elapsed, and Lady Lucie arose, and soon the pretty, creamy satin draperies disappeared in the same direction as George Leeson had taken. Lady Vincent smiled to herself, and Alan, meeting her glance, looked up laughingly into her happy eyes.

"I hope he will win her, Cora," he said, softly. "He is worthy of her."

"She is won," said his wife, triumphantly. "She loves him already. If he will but speak, she is his. Oh, that tiresome money, Alan! It is always in the way, somehow. There is either too much of it or too little. Sing something, Alan."

"What do you want me to sing, Cora?" he said, merrily. "Something appropriate? '*Si tu savais*,' for instance?"

"Don't be absurd!" she replied, petulantly, atoning for the petulance the next moment with a kiss.

Sir Alan hesitated a moment, then he played a soft, dreamy prelude, and his deep, rich voice rose softly on the stillness, reaching the conservatory, where George Leeson and the heiress stood together. And the words he sang were these:

"Ask me no more. The moon may draw the sea;
The cloud may stoop from Heaven and take the shape,
With fold to fold, of mountain or of cape.
But, oh! too fond, when have I answered thee?
Ask me no more.

Ask me no more. Thy fate and mine are sealed,
I strove against the stream, and all in vain,
Let the great river take me to the main.
No more, dear love, for at a touch I yield,
Ask me no more."

George Leeson, standing with Lucy Belmont in the shaded conservatory, in a perfect grove of ferns and flowers, heard the words, and glanced down at Lucie's face, as she played with some starry blossoms of stephanotis which she had gathered. A pretty rose-color had risen in her fair cheek, and the white flowers trembled in her little fingers, as Sir Alan's words reached her:

"'Let the great river take me to the main
No more, dear love, for at a touch I yield.'"

"They are very happy," said George Leeson, at last, to break the silence. "Do you not think so, Lady Lucie?"

"I am glad," she answered, softly. "I rejoice that it is so. They have passed through the thick of life's battle and have not escaped quite unscarred; now, as long as they have each other they will be happy."

"Having each other," said Leeson, meaningly; "yes, they can be happy."

"Happiness is not always out of our reach, Mr. Leeson," she said, very hurriedly, the rose-color deepening into crimson as she spoke; her eyes persistently dropping upon her hands. "Some people do not care to reach it."

"Do not care?" he repeated eagerly—"do not care? Some people dare not; happiness is too high for them—too far above their heads."

"Too high? If so, it is because they do not try to reach it," she said, softly.

"Do not try," he rejoined, quickly, catching her hand in his, and looking eagerly into her downcast, blushing face. "Lady Lucie, do you know what you are letting me believe? Do you know that you are letting me think that the mad, presumptuous feelings I have dared to cherish towards you are not displeasing to you? Ah! Lucie, forgive me! I love you so dearly. I have loved you for so long and so hopelessly, I can hold my peace no longer. Send me from you if you will—hate, despise me for my presumption—but the secret is out now—I love you!"

He had dropped her hand at the first movement she made to disengage it from his clasp; and now, as she did not answer, he turned away from her, covering his face with his hands. She stood by him silently for a moment—not doubting his love, the ring of passion in his voice was too genuine for that—but almost fearing he would deem her unfeminine if she told him too readily that his love was returned.

"Perhaps I wish you to believe it, Mr. Leeson," she said, at last very softly. "Perhaps that which you call mad presumption is very precious to me. Perhaps"—as he turned and caught her hands, full of flowers as they were, in his, pressing them, stephanotis and all, to his lips.—"perhaps, I, too, have a secret I wish to let you share. Perhaps—no, not perhaps—I love you, even as you love me."

With that Lady Lucie's fair head sank on the artist's shoulder, and the kisses he had been pressing on her hands were transferred to her face. I will not even say that she did not return one of them.

So the "lady of high degree" was happy in the honest, steadfast love she had won. "At a touch she had yielded," and she was his own for ever.

* * * * *

A few months after a paragraph appeared in the first sheet of the "Times"—that portion of the newspaper so dear to feminine readers, which caused no small excitement among the "upper ten."

"At St. George's, Hanover Square, George Alfred Leeson, Esquire,, to Lady Lucie Matilda Belmont, only child of the late Earl and Countess of Fernhill."

Cora Vincent and her husband were among the guests at that wedding, which, indeed, had been delayed a little to allow her to be present, for little Harold had a tiny successor in the nursery now, and the rooms he had filled with childish mirth and the patter of little feet are no longer silent, although he is not forgotten.

"So you have got your wish, wife mine," said Sir Alan, when they had returned from the wedding, and Cora glided to his side in her soft robes of shimmering moonlight blue—she had put off her mourning for the occasion. "Are you satisfied with your manœuvres, little match-maker?"

"Quite," she answered earnestly, leaning her fair cheek, a little pale still, on his breast as he drew her within his arms. "Lucie is very happy. She has the best husband in the world but one, (an adoring upward glance here into Alan's face), "and their future may be briefly summed up like ours, dear Alan, in the words with which we used to finish our fairy tales, "They lived happy ever after."

* * * * *

And the same newspaper which chronicled George Leeson's marriage, told all who cared to know it that the Earl of St. Maur had succeeded in obtaining freedom from the ties which bound him to the worthless, beautiful woman who had been his wife, and Lady Helen St. Maur was free to wed with the man for whom she had given up all.

Can it be said of them, I wonder, that they "lived happy ever after?" I think not—I fear not. They that sow the wind must reap the whirlwind, and such seeds that they had sown could bring forth no sweet or pleasant fruit. As soon as it was practical after the divorce, they were married, and as Viscountess Almane, Lady Helen found many a foreign *salon* open to her, many a titled and distinguished foreigner, ignorant of her story, and ready to receive, with open arms, the beautiful and charming "Vicomtesse," with her *ravissante* toilet, her high-bred manner, her queenly grace. It was but a few, and they were very close observers, who detected the false ring of her laugh, the real bitterness underlying her light and careless manner, and none knew why, when she bent over a child, her lips trembled and her eyes softened.

"Perhaps miladi has lost a child?" said a great French lady, gently, one day.

"I have lost four," said Lady Helen, passionately, thinking of the four little children who had once been her pride and delight, whose very memories gave her a shooting pang now; of her son who would be heir to a fine title and noble estate, and who would never know his mother, and if he knew of her could but despise her sin and her shame.

But when such thoughts as these came to the unhappy woman, breaking in unwelcomed on the few quiet moments her gay life allowed her to take, did they humble her and make her penitent? did they make her strive to do her duty to her husband and to the little child which came to her after a time? No; whenever the unpleasant intruders came, she dismissed them promptly, redoubled her smiles, flirted, danced and laughed, and was the queen of every *fete*, the belle of every ball.

And he, the man for whom she had renounced her husband, her children, her position, and for whom she had sinned so deeply—what of him? Would he pass his life in foreign cities, a passive spectator of his beautiful wife's triumphs, haunted continually by the recollection of a pale, pleading face, lighted by lustrous eyes, which was still so dangerously dear to him, whose misery he had once attempted?

Lord Almane became a sadder and wiser man! He still thought of Cora Vincent often, and heard of her sometimes, when a chance meeting with an old home acquaintance allowed him to hear of Sir Alan's artistic triumphs and of his domestic happiness. His feeling then was not envy but regret—regret that he, who had once such happiness within his reach, should have passed it by—that he who had once possessed Cora Sinclair's love should have sold it for the chance of wealth. But a gentler influence has taken possession of the Viscount now, and his life may be purified and ennobled yet by his love for his little child. She is a pale, delicate, puny little girl, but for her sake he may find courage to lead a better life and to retrieve the past as far as it may be retrieved, the baby-fingers may lead him to a higher path, and the clear trust and innocence shining in her sweet eyes make him wish that the page of his existence was not so sullied and blotted. Let us hope it may be so.

Of one more personage in our story we must make passing mention—I mean Mr. Marks. George Leeson was right in predicting that that

worthy individual would meet with his deserts at last. It was so; success in imitating the handwriting of his employers and their friends rendered him yet more daring, and the forgery of cheques for large amounts at length led to his discovery and ultimate punishment—a punishment which was richly merited and thoroughly deserved.

Sir Alan Vincent was never again troubled by any visits from his *folle du logis*, "the green-eyed monster;" never again did a doubt arise in his mind as to the sweetness and truth of his wife; and Cora looks up to her husband with almost adoring reverence and love, and her past experience has only made her more humble and gentle.

Marianna still flourishes; there is a charming little Lucie, as well as a bold, gallant, high-spirited Alan, to pay a yearly visit to grandmother Vincent, at the Bungalow; and though no one is exempt from trouble, Cora was not far wrong when she said of George and Lucie Leeson, as well as of herself and Sir Alan, that "They lived happy ever after."

RECENT LITERATURE.

Free Ships. The Restoration of the American Carrying Trade. By JNO. CODMAN. New York: G. P. Putnams' Sons. Price 25 cents.

IT is to be regretted that people do not study for themselves the relative merits of "free trade" and "protection" instead of relying, as many men do, on demagogues and partisan newspapers for information on questions of such vital import. Our prosperity, as a nation depends on intelligent tariff legislation, but so long as the matter is left, as at present, to professional politicians, what better can be expected than that these honorable (?) gentlemen should, to further their own personal ends, continue to tinker at the tariff, changing and modifying it, thereby causing such a fluctuation in values, as to seriously derange commercial affairs?

To those who deplore the loss of our carrying trade, the monograph under notice cannot fail to be of interest, and we commend it to the careful attention of all who desire an intelligent exposition of "free trade" as applied to ships. The author says, very truly: "Whatever may be the arguments in favor of, or opposed to, the protection of industries under the control of our own Government, none of them can apply to those pursued upon an area which is the common property of the world. It is a proposition so evident that no words need be wasted in its demonstration, that, other things being equal, the cheapest and best ships, most adapted for the purpose, by whomsoever owned, will have preference in the carrying trade over the ocean. You may pile the duty, for instance, on iron, and grant bounties on the production of the American article if you please, to any extent; you may, if you choose, prohibit the importation of plows, and then assess farmers ten times the cost of their plows for the benefit of the home manufacturer. You would undoubtedly succeed in compelling them to purchase American plows. They must have them or starve, and we should all starve likewise if they did not use those protected plows to cultivate the soil! Indeed, in a less exaggerated way we are doing something very like this continually under the guise of 'protecting home industry.'

"It is a legitimate business for the advocates of that doctrine. If they believe in it they are quite right in 'trying it on,' and in making the people at large pay as much as can possibly be got out of them for the benefit of a few.

"But fortunately they cannot build a Chinese wall around the country. We are necessitated to have intercourse with other nations. We have a surplus of agricultural products to dispose of to them, which they cannot pay for unless to a certain extent we take the merchandise they offer in exchange. The carrying trade is the means whereby commerce is conducted, and this carrying trade, an industry once of vastly greater importance to our people than all ship-building has been, is now, or ever can be, is a business that Congress has deliberately thrown into the hands of Europeans, and sacrificed American *shipowners* at the instigation of American *shipbuilders*.

"In face of the prosperity achieved in consequence of the abandonment of a ruinous system by other nations, in face of the lamentable decadence its maintenance has brought upon ourselves, we still persist in packing this Sindbad of prohibition, the worst offspring of protection, upon our back, and then we wonder that we alone make no progress!"

* * * * * * *

"The flags of all nations are at their peaks—the British, German, Dutch, Danish, Belgian, French—but among the three hundred and more there are only four that carry the stars and stripes, and these were put afloat mainly at the cost of the Pennsylvania Railroad Company. Three hundred steamships, employing fifty thousand men earning a million and a half dollars monthly; these men supporting and educating families, and themselves becoming reserves for their respective countries to call upon for naval service in time of war! Look at the ports from which these vessels wherever built, now hail, and which they enrich by the capital they distribute. Behold the warehouses, repairing shops, foundries, and other various industries connected with these enterprises, and the ship-owners engaged in promoting them pursuing a legitimate business.

"Then look at home. First calculate the sum of one hundred and thirty millions of dollars that has been annually paid by us to those foreigners for transporting ourselves and our merchandise. Then go back in memory to the time when in the days of sailing ships, our packets almost monopolized the ocean on account of the skill of our officers and seamen.

"Reflect that if a policy of ordinary foresight had prevailed in our national councils when these sailing ships were killed off by the competition of the newly-invented iron screw, their old commanders and their noble crews would have kept their employment, and as they died would have been succeeded by men as worthy as themselves, adding to our revenue in time of peace, and, when needed, supplying a navy now maintained at an immense expense—God save the mark!—for the protection of an extinct merchant service!"

* * * * * * *

"Old things did not pass away and all things did not fairly become new until the discovery of gold in California and Australia revolutionized values, created universal national intercourse, and by thus giving a sudden impetus to commerce, made the carrying trade an industry of far greater importance than it had ever been before.

"At that epoch, our restrictive laws were productive of no harm to us, because it so happened that most of the business of the seas was done in wooden sailing ships, and it also happened, fortunately for us, that we had the faculty and the means of constructing them better and cheaper than they could be produced elsewhere. Accordingly our ship-yards became wonderfully active in supplying the demands of our ship-owners, and the *personnel* as well as the material of our merchant fleet being of the highest character, it was consequently in active employment. In the ratio of the increasing value of our carrying trade there was a corresponding decrease in that of Great Britain, simply because her restrictive laws, which were the same then as ours are now, prevented her people from owning such magnificent clippers as we were able to build, on equal terms with us.

"But British statesmen were not inattentive to the situation. They wasted no time in appointing committees to investigate the cause of the difficulty.

"Parliament deputed no half dozen of its members to spend six months in running around among ship-builders, asking them what bounty they required to build clippers like the Americans, and how long it would take them to equal American ship-builders in skill, material and cost.

"But, realizing that the interests of commerce and ship owning were of infinitely greater value than that of mere ship-building, they did not propose to lose them, while the latter industry should endeavor to gain new life. Regardless of any such consideration as that which solely actuated our investigators, Parliament at once *abolished* the *prohibition* to purchase *foreign-built ships*. The *greatest good of* the *greatest* number was the *motive of this wise decision*.

As soon as they were thus allowed to do so, English ship-owners ordered clippers from our ship-yards, and putting them into profitable employment under their own flag, kept on with their business, sharing with us the supremacy of the seas, which, but for the timely action of their government, they would inevitably have lost. In this way they maintained it until there came a new era in ship-building, when circumstances becoming reversed, their mechanics were enabled to accomplish what ours could not, in the construction of iron screw steamships. Had Congress then been as wise as Parliament was in 1849, our ship-owners would, in their turn, have maintained their prestige by supplying themselves from abroad with new vehicles of commerce they could not procure at home, and we should never have heard of 'decadence.' Instead of such obviously judicious action, it has done nothing but condemn us year after year to enforced idleness in the name of 'protection.' So we have endeavored to compete with these new motors on the sea by means of wooden sailing ships and paddle steamers, until they are of service only in our coastwise monopoly or rotting at the docks, if not broken up. We have gone on steadily protecting ourselves to death, and protecting England and Germany, the chief of our rivals, to life at our own expense of vitality. England's justice to her ship-owners, which at first seemed harshness to her ship-builders, was eventually the means of their prosperity. It set them to 'finding out knowledge of witty inventions,' and now they have one hundredfold the capital invested and labor employed in iron steamship building, more than ever found occupation in their old ship-yards."

* * * * * * *

"Almost immediately after the repeal of the British Navigation Laws the revolution in shipbuilding to which I referred had its commencement, and we have seen how British ship-owners avail themselves of it. Nor were they alone in adopting the change from sail to steam and from wood to iron. We can remember what a large trade we had with Germany twenty-five years ago, although it was small compared with that of the present. At that time it was chiefly conducted in American vessels. But when iron steamships came into vogue, wooden vessels, both American and German, were abandoned. If we had been permitted to do so, we should have still kept the greater part of that important carrying trade in our hands. But we were shackled by our navigation laws, while the Germans were unconstrained by any such impediment.

"The *personnel* of our mercantile marine was, in every respect, superior to theirs, but it was consigned to annihilation by our protective government; while Hamburg and Bremen took their galliot skippers in hand and educated them to the responsible places they now fill in command of the splendid lines of iron steamships, making their semi-weekly trips across the Atlantic, having absolutely monopolized the whole American trade!

"Thus our government protected the Germans as well as the English. By citing other examples, we might show how the 'fostering' hand of protection has been extended by our government to every nation choosing to trade upon the necessities of prohibited Americans."

* * * * * * *

"The iron screw steamship is now the great and profitable carrier upon the ocean, and all we care to ask is the privilege to avail ourselves of this 'survival of the fittest.' Whence then comes the opposition to what should be the inalienable right of an American citizen to own the best ship that he can buy with his own money? Naturally, from the few iron shipbuilders in this country."

* * * * * * *

Mr. CODMAN concludes his essay with the following parable: "There are two large towns on the opposite banks of a wide river. There is a constantly increasing passenger and business employment, supporting several ferries, between them. In former days the principal ferry-masters were an American, an Englishman, and a German. They all employed boats propelled by sails, and especially the first did a very profitable business. Indeed, the American was the most successful, as he and his boys had a way of handling their craft much superior to either of the others. Each had a large family of relatives, and, naturally, as these relatives of theirs were willing to work for the same wages as other people, they built new boats for their kindred whenever they were required.

"It so happened, however, that the American's family built much better than the Englishman's. When the latter noticed that the superior craft of the former were better patronized by the public than his own, he asked the Yankee boys if they wouldn't build some boats in their style for him? 'Sartain,' they said, 'if you'll pay us what Uncle Sammy pays for his'n?' 'Aye, of course I will,' said Mr. Bull, 'for boats like yon I must have, or Sam will run away with all my business, and my family will starve.' So Uncle Sam's boys built the boats for Mr. Bull, and the two old gentlemen got on amicably, for there was business enough for them both, and the Dutchman did not interfere with them a great deal. The few carpenters among Mr. Bull's relations did not like this very well, but the old man said to them squarely, 'Look you here, now, d'ye think I'm going to let fifty of my relatives stand still because two or three of you, who can't build boats as well as Sam's people, are growling about it? That's not my way; I work for the good of my family at large. Go to work now, and see if you can invent a better boat than they build; if you can, I will employ you, and so will Sam.' They took the old man's advice, for they saw the sense of it, and in a short time they studied out a craft superior in every respect to anything they had before, or that Sam had now. 'That's right, boys!' exclaimed old Bull, rubbing his hands with glee, 'now build some of them, and I'll buy them of you, and so will Sam if he isn't a fool.' They did build some excellent boats, to which the public took at once; and everybody who wanted to cross the river; or to send any goods over immediately, gave Mr. Bull their custom. He grew rich suddenly, not so much from *building* boats as from *using* them. Nobody patronized Sam's now old-fashioned craft. Uncle Sam, generally supposed to be a 'smart old fellow,' couldn't understand it at all. 'It's one of those things that no fellow can find out,' he said, 'but next time we have a family meeting we'll appoint a committee to get at what this here 'decadence' comes from.' So he appointed a committee, and they ran around six months among the carpenters of the family, and came back with a report that 'Whereas, a few years ago, during a family row, a lot of old ferry-boats had been stolen by or sold to Mr. Bull, this had killed boat-building ever since; and it always would be dead until every one of the family put their hands in their pockets and supported the carpenters till they had learned to build just such boats as Bull was using.' In the meantime it may be remarked that the Dutchman had got Bull's boys to build some new boats for him, and he was now doing a better business than he had ever done before. Uncle Sam looked on and observed, 'By jingo, this here's a fix; I've asked my family to hand over the cash to support these carpenters of mine, and they preemptorily refuse to do so. Well, never mind what, and now that whole raft of boys, who were earning money for me on the ferry, are digging clams or gone to farming, and when I want to go across the river I have to go with Bull or the Dutchman, and pay them for it, instead of getting money for doing what they do, myself.' His boys, who were thrown out of employment on the ferry, thereupon approached the old gentleman and said, 'Uncle Samuel, don't you remember how, a while ago, when those carpenters of ours built better boats than Mr. Bull's could build, the old fellow came to you, and asked you to let them build some for him? If he hadn't got them from us his fellows would shortly have been high and dry, as we are now; but we sold them to him, and so he kept up his business on the ferry. Now, why don't you do what he did, and give us something to do, instead of spending your money going across in his boats and the Dutchman's?' Uncle Sam reared right up at this mild remonstrance. 'Git out,' he exclaimed, 'you ain't no account, the ferry's no account, there ain't nothing of no account in this here family but just a half-a-dozen boat-builders. Say, Jonathan, what are you doin' with that ar' jack-knife? Did you make it?' 'No, sir; I bought it of one Bull's boys.' 'Well, then, lay it right down; *I ain't a-goin' to have you whittle till you can make one for yourself.*' And then the old man went off—mad! And in another sense of the word, he is still mad."

We have quoted thus generously from this monograph, not for the purpose of getting converts to the doctrine of free trade, but to induce you, read—if possible, to interest yourself in the question of tariff or no tariff. Investigate the workings of the opposing systems both in this country and abroad. Have an intelligent reason for your opinions for or against free trade, and do not accept unchallenged the conclusions of political leaders who never see beyond party lines, and to whom the success of their candidate is of infinitely more moment than the welfare of the country at large.

Between the Gates. By BENJAMIN F. TAYLOR. Chicago: S. C. Griggs & Co.

THIS is the brightest and most fascinating of books. Mr. TAYLOR not only interests the reader in his narrative, he does more; by his incomparable word-painting he makes his scenes and his adventures so realistic that the reader veritably sees the mountains, woods, cities, peoples and situations so graphically described, and shares the emotions of the author. We subjoin a few extracts which illustrate Mr. TAYLOR'S claim to the title bestowed on him by an enthusiastic admirer, the "Raphael of writers."

FROM WINTER TO SUMMER.

"A California train is a human museum. Here now, upon ours, are the stray Governor of Virginia, an army captain going to his company in Arizona, a trader from the Sandwich Islands, a woman from New Zealand, a clergyman in search of a pastorate, an invalid looking for health, a pair of snobs, Mongolians with tails depending from between their ears, the proprietor of an Oregon salmon-fishery, a gold-digger, a man whose children were born in Canton while his wife lived in San Francisco, some Shoshones and dogs in the baggage car, and a family who ate by the day, breakfasted, dined, supped, lunched, picked and nibbled without benefit of clergy. It would take a chaplain in full work just to 'say grace' for that party. Victuals and death were alike to them. Both had 'all seasons for their own.' They ate straight across the continent. If they continue to make grist-mills of themselves, crape for that family will be in order at an early day.

"At some station in the Desert where we halted for water, there sat, huddled upon the platform, some Shoshone Indians, about as gaudy and filthy as dirt and red blankets could make them, and papooses near enough like little images of Hindoo gods to be cousins to the whole mythology. One of the squaws, with an ashen-gray face and white hair, a forehead like a hawk's, an eye like a lizard's, an arm like a ganglion of fiddle-strings, and a claw of a hand, looked to be a hundred years old, and her voice was as hollow as if she had an inverted kettle for the roof of her mouth, and talked under it. Near by, on the same platform, an Englishman was passing to and fro, putting down his well-shod feet as if he had taken the country in the name of the queen of 'ome and the Empress of H'India. A Frenchman, in a round cap with a tassel to it, stands with the wind astern and his brow bent like a meditative Bonaparte, trying to light a twisted roll of paper in the hollow of his hand. Two Chinamen in blue, broad-sleeved blouses, their shiny black cues swinging behind like bell-ropes in mourning, stood near, shying their ebony almonds at the whole scene. On the track, waiting for a shake of the bridle, waited the engine, breathing a little louder now and then, like a man turning over in his sleep.

"Regarded with thoughtful eyes, the grouping was impressive. Here, in the Desert, as far away from blue water as they could possibly get, standing upon the same hundred square feet of platform, were Mongolians from pagoda-land of the "drowsy East," aborigines from the heart of the continent, men from Fatherland and Motherland, and the lands of the lilies, the storks, the long nights, the broad days and the—interrogation-points, all met and mingled here for a little minute, and the cause of it is the wonder of it. There it stands upon the track. It is number 110. It is the locomotive, at once a beast of burden, a royal charger, a civilizer and a circuit-rider."

* * * * *

SAN FRANCISCO STREET SCENES.

"San Francisco! Crowned with palaces and dense with business houses as a redwood forest, six currents of life surging along her congested streets that jar with the endless thunder of commerce, four on the sidewalks and two on the cars; the ships of the world courtesying through the Golden Gate and sailing into the Bay like stately old dowagers entering the reception-room of a monarch. And then remember it was a desert of sand-dunes, strown with seaweed and white bones, and desolate as an old African Gold Coast thirty years ago, a time hardly long enough for a century-plant to get a good ready for blossoming, and now more than three hundred thousand strong, it faces both ways and confronts the world!"

* * * * *

"Street life in San Francisco is a kaleidoscope that is never at rest. There is nothing like it on the continent. The flower-stands with their gorgeous array, the open-fronted alcoves fairly heaped with floral beauty, as if Eve had just moved in and had no time to arrange her "things"; the glimpses of bright color from leaf and blossom, that catch the eye everywhere, in mansion, shop and shed; the bits of bouquets you see on draymen's coat-collars, and blooming from broken cups in tinker's dens and smithies; smiling in churches in prayer-time; adorning brides with genuine orange blossoms; strewing coffins with everlasting June.

"Then the fruit-stands that are never out of sight, with the mosaics of beauty spread upon them, as if Pomona's own self presided at the board. Rubies of tomatoes, plums and cherries; varnished apples from Oregon, as cheeky and ruddy as "a fine ould Irish gentleman"; pears, peaches, apricots, nectarines, oranges, and those cunning Lilliputs of lemons, the limes; strawberries, blackberries and raspberries, that melt at a touch of your tongue; fresh figs, looking like little dark leather purses, and full of seeds and sugar—all these grouped upon the same broad table; everything from all the year round but snowballs, as if the gifts of the seasons were converged, like sunbeams through a lens, upon one luscious spot of summer luxury and brilliance. You halt if you are not hungry, for you have learned that the richest beauty is not always in the flower. You find that fruit goes by avoirdupois; peaches are in pounds and not in pecks;

that it is not much cheaper than it is three thousand miles away; that your dimes have turned into "short bits," your quarters into "two bits"; that three "bits" are thirty-seven and a half cents, and it takes forty cents to make it; that pennies are curiosities, and poor little nickels nowhere; if an article is not five cents it is nothing; if it is twelve cents it is fifteen. So you buy something at a "bit" a bite and move on.

"This is the paradise of boot-blacks, the rainless-sky weather from spring to fall rendering 'a shine' a good investment. These artists on leather have little wardrobes of affairs set against the buildings along the sidewalks, furnished with easy-chairs and foot-rests, and often carpeted and adorned with mirrors and pictures. At the first glance, they remind you of the wayside niches in foreign countries wherein some saintly image is enshrined, but a second look, and the saint is resolved into a very earthly piece of human-ware, armed with brushes and French polish, to make looking-glasses of your upper leathers. And these Mother Hubbard's cupboards of places are as good as a weather-gauge to a stranger, telling him that the year is one long genial season, neither summer nor winter, but the tonic of the one and the glow of the other. * * *

"You notice in the ever-moving tides of street life an absence of the rainbow tints and the flickering white of woman's Eastern apparel. The hues are soberer. Seldom a day in a whole year that fur sacques, shawls and overcoats are not in order at some hour between sunrise and bedtime. It is July, but see the fur-trimmed garments and the dark cloaks and the heavy veils go flitting along, and the sun just emptying his quiver of golden arrows all the while."

* * * * *

'JOHN,' THE HEATHEN.

"You seem to be in the sign of Libra, the Scales. There is John, the taper-eyed, with his blue shirt and his wapsy trousers, and stubby shoes, and his black braid of stub and twist, thirty thousand of him, going about with a springy pole balanced upon his shoulder, and a deep bushel basket swung from each end, filled with 'garden truck.' Libra, the Scales, catches the spring of that pole in his knee-joints, and goes teetering about in the most *outre* and monkeyish manner. If you leave the city and plunge into a cannon, you meet John with his panniers, a peripatetic pair of scales. He is the only man in the world who makes a trunk of a spring-pole.

"John always forgets to tuck in his shirt, and if he is well-to-do he wears two, white beneath and blue or black without. He *finishes* dressing where the rest of mankind *begin*. What would you have? He advances backward and retreats forward, and falls upward and rises downward. He is the animal man inverted, subverted, perverted, and everything but converted. Discover how the world always does anything, and that is precisely the way John *never* does it. Thus, the other day he was arrested for stabbing a countryman, and where do you suppose he struck him? Why, in the *sole of his foot*, and that is the Chinese of it.

"To me he looks as much alike as a flock of sheep. Shepherds tell me they can distinguish any one in a flock of a thousand by its face, but John is too much alike for me. I pass him on the street, and then in a minute I meet him. To be sure he has changed his shirt and his shoes, but he has kept his face. He took some soiled handkerchiefs of mine one day to wash, which he did not return, and his name it was Foo Ling. So I went out to find him. I succeeded in three minutes. I overtook him, and passed him, and met him. He had those little wipers-away of tears, as white and square as so many satin invitations to a wedding, in his hand, in a towel, in a basket, but he said he was not he, and I was somebody else. It was a fearful case of mistaken identity. The streets were crowded with him,—but alas for Foo Ling, it was fooling he was. It was one of his 'ways that are dark.' If the devil should have his due, why not John? Without him the Central Pacific road would have waited completion many a long day. Without him San Francisco would not be the cleanest-collared and cuffed and bosomed city in America. Its inhabitants are as white around the edges as the brim of a lily. Neither in New York nor Chicago do you see faultless linen so universal. A laborer's clothes may be out at the knees or the elbows, or any other point exposed to wear and tear, but he is quite sure to show a bosom and collar immaculate. John is a laundry. He can wash, iron, crimp and flute fit for an angel. He is handier than Bridget. He is master of suds, an artist in starch, and a marvel to sprinkle. You should see him do it. He takes up a mouthful of water as your horse drinks, and out it plays in a spray so fine that were it not a breath mistier it would float away in a cloud. People have unfortunate ways of putting things. They say he *spits* on the clothes. It is as little like it as the feathery spray of a garden fountain. People visiting China, as you and I will, look through the Celestial markets for *rats*. They hunt the flie-tailed rodent like Scotch terriers. They expect to find him hung by the heels to a perch, just as good Christians bestride that same roost with the delicate and infantile hinder legs of Batrachians, which are frogs, which are tadpoles, which are polliwogs, which are the verdant scum called spawn. Let us play leap-frog and be happy! Let us suffer him to make a *bonnebouche* of hen's feet while we dispose of the gizzards, and serve up his bird's nests at will while we eat pinfeathery squabs with not a bone in their bodies.

"John is a problem that never got into Euclid. We speak slightingly of him, we despise his effeminate look, his insignificant stature, his shirt, his slouch, and the three feet of heathenism in his back-hair. We scout him altogether. But somehow he has gotten into every crack and crevice of the Pacific Coast. Like an invasion of ants, he is everywhere under foot. He is born into this country, not one at a time, but five hundred at a birth He has made himself useful within doors and without. We eat of his cookery, we wear the garments he has kissed with a hot iron, we ride over the railroads he has builded, and lie upon the pillow he has smoothed. Dogs have been known to take to cats instead of after them, but it is not the rule. Americans have been known to love John, but it is seldom. The sight of him seems to rouse something of the ugliness that lurks in almost everybody.

"But his position and destiny have assumed a dignity that commands respect. John has gotten into Congress, and inspired a virulent hatred in the breasts of thousands. They would organize him out of existence with the Anti-Coolie Societies, and the Caucasian Orders, and the White Leagues. But he is here, spring-poles, baskets, opium, pig-tails, idols and all. He came legally. He remains lawfully. He labors assiduously. The only general sentiment of admiration he inspires is when he dies and goes to—China. Sensible men want some of him, but not the five hundred millions behind. Those mighty magnates of hot water, the railroad kings, and the mighty ranchmen who cannot look upon their ranges in a day's ride, and whose flocks and herds are uncounted—these men, these monstrous and unnatural products of the Pacific Slope, want all they can get of him. They would elude the true 'golden mean' of American society, the white Christians who toil with their hands, and leave Midases at one end of humanity and heathons and slaves at the other—a social state that is a libel on the age, a disgrace to man and a dishonor to man."

Bits of Talk about Home Matters. Bits of Talk for the Young. By H. H. (Square, 18mo.) Cloth, $1.00. Red edges. Boston; Roberts Brothers.

WE have taken occasion in previous numbers of the RURAL to speak words of approval of the first of above-named books. We have sometimes wished it had a different title. "Bits" seems diminutive. The book is not large, but it contains more large thought and good sound common sense, than are often found in single volumes of any size. And still the title may not be unappropriate, for the book contains forty separate and distinct articles, each a treasure in itself. We wish every mother in the land could be so fortunate as to have opportunity to read this book. She would soon find that it was not to be read hastily or carelessly, but "soberly, discreetly and in the fear of God;" and we pity her sincerely who can read it without being made better by it. We shall be glad, too, for the children of the households where this book is read; they will be blessed and enobled by its influence. Those who read the first will want the other, above named, "Bits of Talk for the Young." A collection of twenty-six stories for children. Illustrated—and such stories. There isn't one that the most uneasy little boy or girl would'nt keep quiet to hear, and ask for another when the one was finished.

Atlas Essays, No. 3: Labor. The Republic. New York: A. S. Barnes & Co. $1.00.

THESE essays originally appeared in the International Review; the title "Atlas" being designed to indicate that the essays are contributed by writers from both hemispheres. The subjects are chosen with a view to elucidating the absorbing problems of present interest, and it is only necessary to see the names of the writers in connection with the questions discussed, to be warranted in seeking, in these discoures, edifying and useful information. Among the essays classed under the above title in No. 3, are "The Working Classes in Europe" by Thomas Hughes, M. P., "Labor in England" by Thomas Brassey, M. P., "Grangerism" by Dr. Francis Wharton, "The American Republic" by Gen. Franz Sigel, "Indian Citizenship" by Gen. Francis A. Walker, "The Chinese Question" by Dr. E. D. Mansfield, etc.

The Gospel according to Luke. With Notes, Comments, Maps and Illustrations, by Rev. LYMAN ABBOT. New York: A. S. Barnes & Co. Price $1.50.

THIS admirable work will be of the greatest service to Sabbath-school teachers and Bible-class scholars. Nothing which could possibly help to a clearer understanding of this gospel, either in the way of commentary or of illustrations has been omitted. The book reflects great credit both on the editor and on the publishers.

The Reading Club. GEO. M. BAKER. Boston: Lee & Shepard.

MR. BAKER makes it his aim to give such selections as have not as yet appeared in other compilations, and he offers the present volume with the assurance that those who are seeking for something new, cannot fail to be satisfied. The author has shown judgment and taste in the selections given.

PETTINGILL'S NEWSPAPER DIRECTORY for 1878 is strongly bound and printed on fine, toned paper. The information is concise and well arranged for easy reference. The prefatory remarks on advertising are cogent and, well digested, would save many a man's money. There is a blemish, however. In an evil moment the editor thought it advisable to put some pictures in the book. Two are good; the remainder about equal the high art that adorns dead walls, circus posters, etc.

FRESHMAN & BRO'S ADVERTISERS' MANUAL, toned paper, cloth covers, has been received. It has been bandied about, with parrot-like iteration, that a man can spend a fortune in injudicious advertising, and in the end have plenty of advertising and no results. If such a man were to profit by the condensed, practical advice set forth in the manuals, injudicious advertising would be a worn-out phrase. We commend the FRESHMANS and their manner of doing business.

For Women.

CONDUCTED BY MISS FAITH RIPLEY.

NUMBER NINE TO NUMBER ONE.

WELL, Marian, fair eldest sister,
I've come. You are sorry, I know,
For I'll yell like the other eight babies,
Now grown to a down-sloping row.
And I'll hiccup and stare and fall over,
And tear every novel and note,
I'll grab at your ear-rings and bracelet,
And twist off the tie at your throat.

I'll wake up at six in the morning,
And cry to get up and be dressed.
When poor little mother is weary,
And need's ev'ry moment of rest.
I'll hit little Ann, if I choose to,
I'll take Kitty's doll by its clothes,
And I'll hammer it over the fender
Till it hasn't a scrap of a nose.

I'll make the cat dance in your basket,
And tangle your knitting and wool,
I'll muss up my father's shirt-bosom;
And give Tommy's white hair a pull.
I won't have to be whipped for it either,
As you were. You poor "Number one."
You got all the discipline over,
While I come in time for the fun.

For the mother, you see, is so weary,
And tired of nine little cares,
And papa too busy to mind us
Whilst struggling with business affairs.
But then, when your heart is nigh broken,
And weary and worried, you cry,
I'll come with my own little apron
To wipe off the tears from your eye.

And putting both fat arms around you,
I'll kiss your soft, velvety cheek,
And I'll tell you I'll try to be better,
As plain as a baby can speak,
And then, "Number One," you will hug me,
You know, to your warm, loving breast,
And will never tell mother your trouble,
But leave her to health-giving rest.

And if I wilt down in the summer,
And, tooth-cutting, wimper and pine,
Don't I know how your tenderest touches
Are waiting for small "Number Nine?"
Ah! if I should slip out of trouble,
To the bright other side of the sky,
And your arms that are tired, were empty,
Don't I know how you'd sorrowing, cry?"

It's queer how they love us—wee babies—
It don't seem as tho' we *could* pay;
And yet, how the arms close about us
To keep the dark Shadow away!
Just wait a few years, sister darling,
I'll grow up as quick as I can;
And then—won't I smooth the rough places
For you, when I've grown up a man?

[*Ethel Lynn.*

A PARISIAN BEAUTY'S REVENGE.

AN English marchioness, resident in the legitimist faubourg, and avoiding the Napoleonites as low, gave parties on a grand scale. To one of these an English lady took, uninvited, a pretty French woman, a friend of the Empress. The pretty woman made herself conspicuous by her prettiness and flirtations, but the Marchioness found out who she was, and was disgusted. She said to her:

"I am so conscious of the honor you have done me in visiting me that I dare not expect a repetition of the unexpected compliment."

The pretty woman grew pale, but smiled and ordered a cavalier to go for her carriage. The pretty woman was clever, and finessed a revenge. She bribed the Marchioness' *femme de chambre* to give her the list of the guests invited for the next party. Armed with this she prepared a circular note which she dispatched to each of the invited late in the afternoon of the following day:—"The Marchioness presents her compliments to So-and-so, and regrets that a domestic calamity will prevent her, &c." She then went to a great Mad Doctor, representing herself as the daughter of the Marchioness, and acting with the consent of the ladyship's family, she represented that her mother, the Marchioness, was afflicted with insanity, and her madness was in the delusion that she was always having great parties. For instance, if Monsieur, the Doctor, went to her ladyship's hotel that evening he would find her dressed in great splendor, with the saloon illuminated, adorned with flowers, and buffets covered with refreshments.

The doctor went, on the understanding that he was to obtain the proper police authority to take the Marchioness to a Maison de Sante in the event of the representation made to him being confirmed by his own observation. He arrived at ten in the evening. He was the first, the only guest. And though the Marchioness did not remember his name she took it for granted she had invited him, and was profusely civil. His manner puzzled and his questions startled her; lunacy became more clear; she was at last offended and rang for her servants. At the same time he made a proper intimation of his police authority; and the end of the story is that she was taken off by the doctor in hysterics and detained as a prisoner in his asylum until the whole truth came out. All Paris was in roars; and the pretty flirt was a heroine forever. Protected by her august friend, she escaped retaliation—a British marchioness is too grand for wit.

THE MAN IN SCARLET.

It is usual for the press to chronicle the costumes worn by ladies on great occasions, and when one of the sterner sex elects to appear in public in silk attire, it seems but fair that he should also receive some recognition of his taste in millinery at the hands of newspapers. As a matter of justice then, to Cardinal MCCLOSKEY (surnamed the American flamingo), we publish the following description of the toilet worn by him on the occasion of his first appearance since his return from Rome, at Saint Patrick's Cathedral, in this city:

The cardinal's soutane was of lustrous watered red silk, the train flowing yards behind. This garment was gathered at the waist with a broad girdle of red silk, with heavy gold tassels. Over the soutane was a surplice of fine lace. A chasuble of embroidered cloth of gold fell from his shoulders. In the center of the cross embroidered on the chasuble, and surrounded by rays of gold, was a pelican, feeding her young in her nest, signifying the motherly care of the Church for her children. About the collar of the chasuble was the pallium—a distinctive mark of the cardinal's state—woven by pious nuns, whose cloister is within the shadow of the Vatican, from wool shorn from lambs by priestly hands, on the anniversary of their patron saint. On the cardinal's head was the berretta. His hands were incased in red silk gloves, crosses of golden embroidery being on the backs. On the third finger of his right hand was the signet, a sapphire, encircled with diamonds. On his feet were sandals of red kid, with crosses of gold, being embroidered at the instep. Behind the cardinal was a row of pages, in white soutanes, bound with red silk, red silk sashes, and lace surplices. Two of them bore on silken cushion the cardinal's miter, and the others held his triple cross of gold, set with many jewels, his golden crosier, and his missal, bound in crimson velvet and gold. F. R.

A ROLLING STONE GATHERS NO MOSS.

THIS proverb is only the assertion of a fact that is not very remarkable. Moss is by no means a necessary adjunct to a stone. The mossy condition is not the normal state of a stone. The moss is no more necessary to to the stone than the stone is to the moss; indeed, the stone is more *stone-like without* the moss than *with it*. So, a craving-knife that is kept in active use gathers no rust. So, an individual who has moved about over the face of the globe, and borne the attrition of life is free (or ought to be) from the many prejudices which clug to and choke the growth of one who has spent his life on the side of some obscure hill, seeing no one but some dozen persons similar to himself. I have seen some of these mossy creatures so completely covered by this vegetable growth, as to be themselves little better than plants. They could not see or hear, or comprehend anything beyond their circle. Let the moss grow over the decayed trees and barren places, but let the rolling stone keep on, on, bright and clear, and free from all incrustation. J. L.

WOMEN HELP IN MONTANA.

THE days of John Chinaman in Montana are numbered so far as his services in the kitchen are concerned. Already he has given way to the industrious and economical women cooks just arrived in Helena from St. Louis and other points below. The advent of a goodly number of these tidy housekeepers by the "Big Horn" and "Rosebud" is only the precursor of others that are to follow, seeking the remunerative wages offered in Montana. For economy and cleanliness one good woman cook is worth to any household a whole generation of Chinamen. Those who have already arrived have found agreeable employment in private families at thirty dollars a month. From letters received it is believed that every steamer that arrives at Benton will bring other additions to this desirable and profitable immigration of women help.—*Helena, Mont., Herald.*

GOOD NEWS FOR HOUSEKEEPERS.

CELLULOID has been put to ingenious uses, but its usefulness promises to be yet more widely extended. The Paterson (N. J.) Guardian states that a factory at Riverside, bolted and barred to keep out all curious intruders, has been for some time engaged in the manufacture of celluloid cuffs, collars and other articles heretofore made of linen or paper. The Guardian says:—"It will ruin the laundry business and rob Monday of all its horrors for married men, for when this material gets soiled, all that is necessary is to hold it under the hydrant, or shake it in a pail of water, and then dry it with a towel, the same as one would wash a slate or a plate. Despite its durable character, the material is said to be as pliable and comfortable to the wearer as linen, which it so closely resembles as to deceive the most thorough expert."

PRETTY HANGING BASKETS can be made of oyster or peach cans, by removing one end, and cutting them in strips one-third of an inch wide, leaving one-half of an inch at the bottom. Press it the shape you desire, and clinch the ends at the top over a strong wire, several inches larger in circumference than the bottom of the can. Paint it green, and when dry line it with green moss from the woods or with cultivated moss from the garden. Fill with good, rich soil and plant therein Kenilworth Ivy, Strawberry Geranium, or some other pretty trailing vine. Suspend it at the window by a wire or tiny chain. This is indeed a "thing of beauty," if kept in a thrifty condition. Hang it over and in a pail of rain water occasionally to water the moss.

JULIA M. W.

KISSES.

EIGHT basial diversities of kisses are mentioned in the Scriptures:—The kiss of Salutation, Sam. xx. 41; Valediction, Ruth, ii 9; Reconciliation, 2 Sam. xiv. 33; Subjection, Psalm ii, 12; Approbation, Proverbs, ii 3; Adoration, 1 Kings, xix. 18; Treachery, Matt. xxiv. 49; Affection, Gen. xiv. 15. There are some other kinds of kisses which young ladies receive over gates o' moonlight nights, which the scriptures do not mention—neither do the young ladies.

Domestic Economy.

CONDUCTED BY EMILY MAPLE

THE KITCHEN CLUB AMONG THE ROSES.

ANNIE L. JACK.

It happened by the merest accident that so many members of the Kitchen Club stood together under the Maples, and breathed the perfume of Roses and Honeysuckles, with the fragrance of the wild grape, flowers that festooned some of the trees, that pleasant day in June. One neighbor called to bring some of her visitors; another to spend the afternoon; and two others happened to run in on a friendly errand. Pale Mrs. Lockston was envying her more robust friends, their rosy cheeks, and Ellis Davenport ventured to ask why she was so delicate and pale, "for we remember in your youth you were so different."

Mrs. Lockston gave a short and distressing cough as she answered, "I think it is the sewing machine. You know I do all the children's clothing, and the way clothes are made nowadays, it is no easy task."

"Ah! there is the secret!" said Mrs. Bunster; "*the way they are made*, and until women free themselves from the thraldom of frills and fluting, there is no hope for their health or happiness."

Smiling at her energetic response, I ventured to add: "Last week I went to the city, and into a hardware store, where, after necessary purchases, I asked the obliging clerk if they had anything new in household conveniences, as on this subject I feel great interest. Would you believe it, the first thing he brought out was a new patent *fluting machine!* Useful, of course; but what I wished to see was something to ease the work of washing, ironing or cooking, with the inevitable dish-washing and cleaning; and yet he imagined my first and greatest need was a fluting machine!"

The ladies laughed, and, of course, asked me about the new patent, of which I had to confess I know nothing, and then we sat down to tea out-of-doors, under a grand old maple tree, with an oriole's nest overhead, and robbins hopping tamely around. It does not take much to make a tea in June, when butter is so sweet with clover, and strawberries are plentiful—with a bountiful supply of Roses to ornament the table, and pleasant company around it.

We talked of many things, and among others the aid the RURAL had been to us in gardening and domestic matters, of its steady improvement in matter and utility, until the hour of parting arrived. Who would be without the June Roses, the memory of which makes the summer so sweet to us? And depend upon it, mothers, the remembrance of a rose-surrounded home in their childhood, will be life's happy June to your sons and daughters, a sweet and pleasant association with "mother" long after she rests beneath the Roses they will lovingly plant above her.

BUTTER MAKING.

Every neighborhood has its good and poor butter makers and ours is no exception. Among our best is Miss C. who in answer to several questions touching the butter subject, gave me a brief outline of her method. She is at present making butter from three cows, two of them Alderneys, and averages from twenty to twenty-five pounds a week. Her cellar it quite cool, scrupulously clean, as are also the pans, pails etc. The milk is strained into both deep and shallow pans and Miss C. says she has yet to discover that the cream rises in one better than in the other.

The churning is done twice a week winter or summer, not oftener, and ice is never used. From twenty to twenty-five quarts of cream, including some thick milk, is the average churning; and time, from fifteen to twenty minutes to do it in. After churning about five minutes, she pours in two quarts of *boiling* water. This she never omits, except it may be in the hottest of weather. As soon as the butter commences to gather, two or three quarts of cold water are added, and the test when sufficiently gathered, is, "when the butter holds up the dash." The butter is then taken up into a wooden bowl and worked and washed with the ladle in two or three cold waters, that the milk may be all washed out; then salted, worked through and through and set aside for three or four hours, occasionally working it in the meanwhile. At the end of this time it receives the final working, and is weighed out and made into prints for market.

MILK PAINT.

A subscriber writes us that she has used the following preparation instead of common paint for inside work and thinks well of it. To those persons sickened by the smell of fresh paint, it would, no doubt, prove a blessing; but for general use, we have little faith in its taking the place of lead and turpentine, or the so-called chemical paints.

Into a clean pail put six ounces of newly-slacked lime, and over it pour part of two quarts of *sweet* skimmed milk. Stir with a stick, and add by degrees four ounces of oil of poppy, after which add the rest of the milk and three pounds of Spanish white, which should be powdered and poured slowly into the mixture. Apply with a brush the same as other paint.

DOMESTIC RECIPES.

Currant Jelly.

Pick over the currants carefully, and rinse with cold water; put on the stove, in a porcelain kettle, *without* any water. Bruise the currants, and when warmed through, put in a jelly-bag to drain. Strain the juice, and boil ten or fifteen minutes; skim, take from the stove, and pour *boiling* over the sugar. Do not set it over the fire again, but take to a cool room, and stir till the sugar is dissolved; also stir often until cold. Granulated sugar is best for jellies, allowing a pound to a pint of juice. Pour the jelly into glasses, and if thin, set in the sun for a few days. This method will not answer for all jellies, but is an excellent way for currant jelly, as the natural flavor of the fruit is retained more perfectly than by the old rule of boiling sugar and juice together. Currants that are not quite ripe are best for jelly.

Rice Cakes for Breakfast, (Excellent.)

A pint of cold, boiled rice, one-half pint of bread crumbs; cover with milk that is just beginning to turn sour, and leave in a cool place over night. In the morning, add one quart of sour milk, one quart of flour, two beaten eggs, one teaspoon salt and soda (bicarbonate) to sweeten. Bake on a griddle. The milk must not be too sour.

Rice Waffles, for Tea.

"One quart of thin sour milk, poured over one teacupful of cold, boiled rice. Do this two or three hours before the waffles are wanted. When ready to bake, add a pint and a half of flour, two or three beaten eggs, and soda. Oil the waffle-irons each time they are used, with lard that is perfectly sweet. The rice, used for rice griddle-cakes and waffles, should be *salted* when boiling."

Corn Cake, for Breakfast.

Beat together one egg, two tablespoons of sugar, two of melted butter, one-half teaspoon salt, two teacups corn-meal, one tablespoon flour, one teaspoon cream-of-tartar, mixed with the dry meal and flour, half teaspoon soda, and two teacups sweet milk. Dissolve the soda in the milk, and add last. Bake in a shallow tin-pan, about fifteen minutes, in a well-heated oven.

Lyons. MRS. M. G. RAND.

Jellied Chicken.

Cut up two chickens and boil in water, only enough to cover, until tender. Then remove skin and bones and season the liquor, of which there would be a little less than a quart, with butter, pepper, salt and the juice of a lemon, if liked. Dissolve one-fourth box of gelatine in a little warm water, and add with the chicken to the liquor; boil up once and pour into a mold. This is very nice for tea or evening company, when cut into thin slices. A very sharp knife, however, must be used in cutting, or the slices will break into separate pieces. MRS. BRADY.

Leamon's Aniline Dyes.

Allow me to add to Mrs. Maple's experience with these dyes, in RURAL of May 4th, that I have used them, and with great success for spatter-work on either wood or muslin. Pretty sofa pillows or chair cushions may be made of Turkish toweling by first splashing with green, then pinning clusters of small ferns in the center and corners: splash delicately with dark brown. Even unbleached muslin may be made into pretty chair covers in this way, and has the advantage of being less expensive than the toweling. MARY B.

Remedy for Rheumatism.

Just before retiring, bathe the parts affected with water, as hot as can be borne, in which potatoes have been boiled.

This remedy, simple as it seems, has been known to relieve the most obstinate rheumatic pains. E. M.

Relief for a Weak Back.

Add one pint of alcohol to a beef's gall, and bathe frequently. A. B.

QUERIES ANSWERED.

Please give recipe for a clam soup? E. G.

Ans.—Open fifty clams, strain the juice, allow as much hot water as juice and add the clams; boil ten minutes, skim, add a little minced parsley and onion, if liked, and boil ten minutes longer; season plentifully with butter, add salt and pepper to taste, and three or four butter-crackers rolled fine. Put a coffee-cupful or more of milk previously heated, into the tureen, pour in the soup and serve with a plate of butter or soda crackers.

What will relieve the sting of musquito bites? SUFFERER.

Ans.—A solution of carbolic acid and glycerine—fifty or sixty drops of the acid to an ounce of the glycerine.

News of the Week.

POLITICAL.

Monday, July 1.

Since the passage by the House of the resolution with regard to the inviolability of Hayes' position in the presidency, interest in the doings of the Potter Investigating Committee has very sensibly diminished, and the subsequent course of the investigation has tended greatly to increase this feeling of indifference. Mrs. Jenks has been the chief witness again during the week, and has, if possible, been more saucy, impertinent, flippant, and unmanageable than ever. She persists in her story about having, herself, dictated the so-called Sherman letter, and still declines to give the name of the person who wrote it, though she declares emphatically that she did not do this herself. As the committee cannot now punish her contumacy, since the House is not in session, she answers or refuses to do so, just as it suits her whim or convenience, while she makes abundant use of woman's right to be impertinent, impudent, insulting and abusive, without fear of reproof or retaliation. Her evidence is copious and amusing, but while laying bare the rottenness of Louisiana politics, is in all other respects untrustworthy.

Dennis, of Florida, testified that 219 fraudulent republican votes were added to the count in Precinct 13; that he had been appointed to several offices in recognition of his services, without being examined as to his fitness in either case; and that nearly all connected with the presidential election in Florida, had been provided for by the Administration. Ex. U. S. Marshal Pitkin, of Louisiana; W. E. Chandler, ex-Congressman from Maine, and ex-Secretary of the Republican National Committee; "Returning Board" Thos. C. Anderson, of Louisiana, were the other chief witnesses examined by the Committee in Washington. The sub-committee sent to New Orleans, has there examined ex-Gov. Packard, who is about to start to discharge the duties of his office as Consul at Liverpool. He insisted that he had been fairly elected as governor of the State by a larger majority than five of the Hayes' electors; that armed mobs in the interest of Nichols, alone prevented his peaceful inauguration; that if recognized at Washington, he would soon have been able to maintain his position without the aid of U. S. troops; and that he knew nothing, personally, of any trickery on the part of the visiting statesmen. All the witnesses hitherto examined with regard to Louisiana politics, have each emphatically contradicted one or more of the assertions made by James E. Anderson, the ex-superintendent of registration in East Feliciana.

Owing to the haste which marked the transaction of business during the last hours of Congress, the bill for making import duties payable in legal-tender notes failed to become a law. During the enrollment of the Omnibus Bill, an urgent appropriation in regard to the government property at the Hot Springs, Arkansas, was omitted in copying the document, although passed by both Houses. The funds, therefore, cannot be used, and as the failure benefits the numerous present occupiers of the property, it is considered probable that the "error" was paid for by them. More detailed returns from Oregon give the governorship of that State to the democrats by a small majority, as well as a majority of twelve on joint ballot of both Houses of the Legislature. On Wednesday last, Alexander H. Stephens, delivered an eloquent speech at Atlanta, Ga., in which he vindicated his course with regard to the Potter Committee, said that he couldn't be ruled out of the democratic party by a set of political tricksters, and that, if the coming democratic convention failed to re-nominate him, he would "go it alone" and appeal to the people. The Republican State Convention of Illinois was held at Springfield on Wednesday, and the Democratic State Convention of Ohio, at Columbus, on the same day. Both favor the greenback movement, especially the democrats, while the republicans lay the main stress upon the possible payment of rebel war claims. The former, while denouncing the means by which Hayes reached the presidency, declare the question now finally settled; and the latter have nothing to say for or against the President. No Governor is to be elected this year in either State, only subordinate officers.

MISCELLANEOUS.

At Faribault, Minn., the chief business part of the town, including two banks and seven stores, has been burnt; loss, $200,000. Lord Dufferin is reported to have refused the prolongation of his term as Governor-general of Canada offered to him by the home ministry. Gen. Escobedo, after his Mexican defeat, has again found refuge in the United States. Gen. Fitz John Porter, and ex-Surgeon-General Hammond, both formerly dismissed from the army by court-martial, are being re-tried at West Point by a Board of Officers appointed by the President, to the end that any injustice done to them in the heat of war, should be righted. It has been decided, as cattle raids still continue to be made along the Rio Grande, that the United States troops shall in future follow the thieves across the frontier, entirely disregarding all Mexican protests. In the boat race between the Universities of Harvard and Yale on Friday last, the former won easily by twelve boat lengths.

The Azor which started some time back with 250 colored emigrants from Charleston to Liberia has put back short of water after having lost 23 passengers by ship-fever. The Moffet bell-punch has been introduced into Chicago saloons. To-day Virginia's new criminal code goes into operation. Under it, whipping-posts will be set up for the special use of petty criminals and the benefit of the community at large. Farmers in many parts of the West, especially in Ohio, are receiving notices signed "Working men's Bread and Blood Committee," warning them against buying labor-saving machinery, and threatening the destruction of all such implements together with the grain stacks of their owners. Another Mammoth cave has just been discovered in Ky., quite close to Glasgow Junction and named the Grand Crystal. It is said to have been explored 23 miles in one direction and 16 in another. Mummies found in it have been sold for $400; $10,000 have been offered for the cave to Thomas Kelley the farmer on whose 23 acres of land its entrance has been discovered. Among the appropriations made by the late Congress is one of $10,000 to investigate the diseases of swine. This little sop to the farmer, added to the $10,000 already offered by Missouri for the discovery of a specific remedy for hog cholera, may stimulate our cattle doctors and others to greater efforts.

Friday was a very good day for executions. At Frederick, Maryland, Edward H. Costley was hung for murdering his cousin, Solomon Costly; at Cincinnati, Perry Bowman "stretched hemp" for murdering a toll-gate keeper and his wife; Jacob Levels, colored, was hung at Little Rock for the murder of another colored man; John Burns stepped into space at Paris, Ill, for the murder of Elijah Burdell; at St. John N. B. Vaughan, a notorious murderer, received his due, and at Chicago, Jeremiah Connolly aged 19, and Geo. Sherry aged 21, were hung for the murder of Hugh McConville. For some time before their execution these worthies received all manner of loving attentions from the Chicago female, crowds of her daily visiting their cells with all manner of delicacies seasoned with kisses from their pouting lips inserted between the bars, until the jail officials had to put a check on the gushing nuisances.

On Sunday, June 24, four companies of cavalry under Capt. Barnard, making, with the scouts, etc., about 200 men, attacked the Bannock Indians about 45 miles from Harney and killed 42, among whom was the chief, Buffalo Horn. The Indians are estimated to have numbered all the way from considerably under 700 to somewhat over 2,000. Notwithstanding his present fate, Buffalo Horn will probably fight again, as it takes a good deal of killing to get rid of one of those many-lived aborigines. As usual, Gen. Howard, by means of severe marching, reached the battle-field just after the fight was over. The Indians are being hotly pursued. Herders are being numerously murdered by the savages; settlers are fleeing in affright; the Black Hills are threatened; Chief Moses, in Oregon, is said to have 1,500 well armed and desperate warriors, mostly renegades from many tribes, and has also the sympathy of Reservation Indians, who, at a pinch, will reinforce him with 4,000 men, when it would require 20,000 troops to take care of him. Like the English Jingoites, however, he don't want to fight, but if the white men do——

The $19,000,000 deficit which has lately been claimed to exist in the Treasury accounts, is said to be not real but only apparent, and due to a change in the system of book-keeping practiced in that Department.

In East St. Louis, which is in Illinois, just across the Mississippi river from St. Louis city, there has been for a time back a bitter quarrel between the Metropolitan Police and the Mayor who, a short time ago, organized a set of City Marshals to replace the police. The latter seized upon an engine house which was attacked yesterday by the Mayor and his marshals. Three Metropolitans in the house at the time barricaded themselves in and fired at the assailants, killing two and wounding a third.

FOREIGN.

The Congress on the Eastern Question, in session at Berlin, is progressing satisfactorily with the settlement of the points in dispute. The principal matters agreed upon have become known to the public despite the silence which was to be observed with regard to the discussions of the assembly. Greece has been admitted to the meeting with a voice only on subjects connected with her own immediate interests. Bulgaria, north of the Balkans, is to become a semi-independent State, and it is proposed to make Prince Charles of Roumania sovereign of the new principality, also. By this means Russia would be repaid by the retrocession to her of Bessarabia or of the greater part of it; the two petty principalities would be consolidated into a respectable kingdom, and Bismarck's labors would be rewarded by the installation on its throne of a Hohenzollern Prince; thus making German interests paramount on the Danube, as well as on the Rhine. Bulgaria, south of the Balkans, is to be united with Roumelia, under the title of Eastern Roumelia. This is to have a Christian governor, and an administration like that of the British colonies; the governor to be named by the Porte with the approval of the Powers, for a term of five or ten years. Turkish troops are to be withdrawn from the country and to enter it only in case of insurrection or invasion. The Turks are to fortify the passes of the Balkans and to garrison them with a stipulated number of men, and on the roads to the passes, certain spots shall be specified in Roumelia, at which troops on their march from and to the Balkans shall be privileged to halt. Bosnia, and Herzegovina are to be occupied by Austria—a mere preliminary step, it is thought, to their annexation to that empire. Servia is to be independent provided she enfranchises her Jewish inhabitants; Greece is to receive an addition of territory, Montenegro to gain her independence, and all parties in Europe to be satisfied at the expense of Turkey. The arrangements leave the latter in some respects in a worse plight than the treaty of San Stefano, and very considerably worse off than she would have been had she accepted the terms which she refused owing to British encouragement, at the conference of Constantinople, before the outbreak of the late war. Discontent among the Turks is exceedingly bitter; and another revolution at Constantinople is prevented only by the proxi-

mity of the Russian army and the English fleet. Nothing definite has as yet been arranged with regard to Asia, but a considerable Russian accession of territory a small interchange of territory with Persia, and a British protectcrate over what shall remain to the Turks, are not improbable. There are a large number of other conflicting reports, and even some of the above particulars may yet be subjected to modification. The chief diplomatists will probably return home in about a week or ten days, leaving some of their subordinates to settle matters of detail.

The Prince of Hanover has agreed to renounce the royal title, and accordingly Prussia has consented to restore to him the sequestered property of the late King. Queen Mercedes of Spain, after five months of married life, died last Wednesday at the age of eighteen, of gastric fever. Young King Alfonzo, her husband, is prostrated with grief, and the whole nation is mourning. The Emperor William is now all right, and is said to be opposed to the execution of either Hoedel or Nobiling. Gen. Grant has been banqueted in Berlin by the Crown Prince and Bismarck. The Pope has given permission to the Neapolitan Bishops to accept the pay assigned them by the Italian Government. This is said to be due to the falling off in the contribution of "Peter's Pence" from which fund they have been supported since the abolition of the papal temporal power.

The Viceroy of Canton, China, has proclaimed that any attempts by Chinese to lure emigrants on false pretenses to Peru, the Sandwich Islands, or *elsewhere*, will be punished by instant death. The Emperor of Brazil, the Empress and most of the Ministers of State visited the Steamer Rio de Janeiro, the first vessel of a line between this country and Brazil. Dom Pedro says he will do all in his power to cement the ties of commerce and friendship between the two countries.

HERMAN.

VARIOUS.

The death of Marshal Barraguay d'Hilliers reduces the number of Marshals of France to three —MacMahon, Canrobert, and Leboeuf.

Cardinal Franchi has addressed a circular to the Roman Catholic prelates of Germany instructing them to spare no efforts in combating Socialism.

The Quebec rioters who broke into a flour store and stole 400 barrels of flour on pretence of being in danger of starvation, sold it to grocers for $1.50 a barrel, and used the money in buying whiskey.

A Nebraska man asks people to believe that his dog deliberately walked in front of a railroad train, laid his head on the rail, and was killed because of sorrow for the death of a child for whom it had shown a strong attachment.

Frederick Hasse graduated at the head of his class in a German University, in 1870. He was heir to $80,000, and his prospect of a successful career could hardly have been brighter. A few days ago he died in Saint Louis, where he had for a year been a porter in a medical college. An appetite for opium killed him.

A Buffalo Alderman astonished the board, in a meeting for consideration as to the building of a new jail, by remarking; "I makes der motion as der new jail build on der same spot as der old all what's now standing, dat saves der money for der land, and I makes der motion as der old jail shall not be pull down till der new jail is built, so ve vill not be mitout der jail."

Madam Rudersdorff, the popular singer, has settled down on a farm of her own, at Berlin, Mass. She manages her land entirely herself, and is solving the extremely easy problem of making money out of farming. Her dairy products and vegetables find sale at higher prices than those of her neighbors. Her house is full of Turkish and Persian rugs, old china, and precious bric-a-brac she has been gathering up for years. She rises at five in the morning, and works in her garden vigorously with a hoe herself. Besides this, she trains in music young lady pupils who reside with her, and she gives lessons in languages.

Every time the Czar announces his intention of visiting a military barrack, that place immediately becomes a show. When he went to Odessa the Colonel in command spent several thousand roubles in making his and their quarters presentable. For three days the soldiers lived, had good clothes, fine dinners, money in their pockets, vodki to drink, and clean rugs to lie on. No wonder their loyalty was pleasantly stimulated toward the sovereign, whose presence brought such luxury; but as soon as he had turned his back, things relapsed into their old condition, which is one of squalor. The money set down for the keeping of a regiment is amply sufficient if applied to that purpose, but a large part of it is stolen by those who handle it.

Hearing Restared.—Great invention by one who was deaf for 20 years. Send stamp for particulars. VERRY & HARPER, Lock Box 80, Madison, Ind.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, June 29, 1878.

BEANS AND PEAS.—The bean market has now one of the slack, listless phases that frequently occur in summer when local demands are limited and exportation calls for light orders. Mediums, Marrows or White Kidneys seldom exceed $1.60 for selected. Red Kidneys very scarce, as prices indicate. Pea beans can be hardly said to have a market here. The N. E. States formerly drew supplies from this point, but latterly the West ships right through. Canadian field Peas in bulk and hand quiet and lower, at 75½c; green peas have a fair call for warm weather at $1.05@1.10; Southern B.E. per 2 bush. bag, $3@3.25.

We quote medium beans, primo, $1 57½@1 60; fair to good, $1 35@1 50; marrows, prime, free on board ship, fair to good, $1 40@1 50; Pea, $1 40@1 65; white $1 60@$1.62½; kidney, $1.40@1.60; red do., $2.85@3.95; black, $2.35@2.40; Lima, $3.75@4.25.

Receipts of beans past week, 3,420 bush. Exports of beans, 107 bbls. Exports of peas, 1,300 bush.

BEESWAX.—There is only a small business as from 26½@27½c. for Western and Southern.

Exports past week, 5,929 lbs.; since Jan. 1, 107,432 do.; same time last year, 60,719 do.

BROOM CORN.—There is very little business with prices essentially unchanged. Quoted at 6@7c. for hurl and short brush; 5@6c. for medium green, and 4@4½c. for red and red-tipped, per lb.

BUTTER.—There is nothing favorable to note in prices. Shippers of lines or round lots have had in some cases better bargains than at our last. It must be, however, a close buyer who contends for much concession from lately current rates for fine grades of State. Still, quotations may be regarded as extreme for local trade, as business will be of light volume for the coming week—the Fourth of July will start many consumers out of town. Of late years the weeks on which the day has occurred, have been worse broken up commercially than other holiday periods. The weather has been hard on butter for several days, and as fine, strong-bodied State has a precedence of most other in hot times, we do not look for a sudden or material shrinkage in prices for choice stock. On the other hand, Western is regarded more shyly, as it does not bore out on the trier with attractive solidity after a warm ear-voyage. Very low rates are named for Western dairy and factory. In fact, low marks are good enough to fetch the extreme for the former, while the latter, either indio packed or milled, is quoted very irregular, and few dealers care to advance liberally upon it. Export demand large, considering it is not speculative.

State creamery, choice, 19@20c.; other, 16@18c.; half tubs and pails, choice, 16@17c.; other, 12@15c.; Welsh tubs, best, 15@16c.; other, 10@12c.; poor State, 6@8c.; State firkins, 15@17c.; Western creamery, choice, 19@20c.; other, 16@18c.; Western dairy, best, 12@13½c.; other, 9@10c.; factory (indie packed), 10@10½c.; other, 8@9c.; milled Western, 5@6c.; old and grease, 3½@5c.

Receipts for the week, 30,432 pkgs.; exports past week, 30,052 do.

CHEESE.—The arrivals for the week have been the largest of the season. Prices held up very well early in the week, but towards the close became weak, and ½ lower on fancy, and ½ off on good grades. The exports reach the large total of 120,000 boxes. The closing sales are at 8@8¼ for fancy white, chiefly at 8, and of fancy colored at 8¼.

Quotations are for fancy, 8@8½c., respectively for white and colored; 7¼@7½c. for good and prime; 6½@7c. for fair; 4½@6½c. for half skimmed; 3@3½c. for skimmed. State, farm dairy at 6½@7½c. for good to choice, 5@6½c. for fair to good and 2@3c. for poor skimmed. Wisconsin factory, fine to fancy, 7¼@8c.; do. good to prime, 6½@7¼c.; do. fair, to good 6@6½c.; Western factory, fine, full cream, cheddar, 7½@7¾c.; do. fine, full cream, flat, 7½@7½c; do. slightly skimmed, flat, 5½@6½c.; do. half skimmed, 4@5½c.; do. full skimmed, 3@3½c.

Receipts for the week, 146,882 boxes.

Exports, past week 120,273 boxes.

Gold closes at 100⅞.

Liverpool cable quotation, 45s.

COTTON has been very dull but closed firm, with quotations for June, 11 53@11.54c.; for July, 11.55c.; for August, 11.52@11.53c.; for September 11.21c.; for October, 11.05c.; for November, 10.91@10 92c.; for December, 10.80@10.91c.; for January, 10.8@10.86c., for February, 11.03@11.05c.; for March, 11.10@11.12c.; for April, 11.20@11.22c. and for May, 11.30@11.31c.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted:

	Uplands.	*Ala.*	*Orleans.*	*Texas.*

Stained.

Good ordinary..9 7-16c.; Strict good ordinary.10 7-16c. Low middling..9 15-16c.; Middling .....11 1-16c.

DRIED FRUITS.—Towards the close there appears some speculative demands for apples, which is prompted by the impression that current low prices will somewhat limit the production; no large sales have as yet occurred, other articles are wholly nominal.

Peaches—Fancy North Carolina 10@11c.; Choice Georgia, 10c.; good to prime Georgia; 8@9c.; evaporated, 20@22c.; unpeeled halves, 3½@4½c.; quarters, 3½@3¾c.; unpeeled evaporated, 7½@8c. Pitted cherries, choice new, 19@20c.; Raspberries, 26c. New York State plums, 10c.; Southern plums, 9c. Blackberries nominal. Apples—State quarters, 4@4¾c., do sliced, prime, 4½@5c.; good, 4@4½c.; Western quarters, 3@3½c.; Southern at 4½@5c. for prime sliced; 3½@4½c. for fair to good; Southern quarters, 3@3½c.; Tennessee quarters, in bags, at 2½@3.

Exports past week, 317 bbls. dried apples; since January 1st, 8,811 do.; same time last year, 24,741 do.

EGGS.—Receipts for the week, 9,978 bbls.; do last week, 10,586 do. Trade has been unaccountably blocked for the season and prices have dropped materially. A good trade is expected next week but prices will not have a good murmer tone. Vegetables are low and abundant and cut off considerable local trade.

Near points, 14@15c.; State and Penn., 12½@13c.; choice Western and Canadian, 11@11½c.; a few off quality lots, 10½c. Sales all loss off.

FRESH FRUITS.—There is now a very varied representation, and after the early morning sales berries have an unsettled position, sometimes the difference is 2@4c. New York apples are of good size, quoted at $2.50 a bbl. N. C., $3@4; Southern astrachan half bbl. crate, $2@2.50; Up River strawberries 3ds, 2½@4c.; Oswego prime, 2@11c. qt.; Oswego and Oneida poor to fair, 5@8c.; L. I., 5@7c.; black caps N. J., 7@8c. qt.; Del. 6@8c.; Antwerp, 6@7c. 8d qts.; red native do. 3½@4c.; Brandywine, pints, 4@5c. Whortleberries, bush., $4@5; demand good. Currants very plenty at 2½@3c. for small red, and 5@6c. for cherry. Blackberries, ib. Wilson's, 12@14c.; Dorchester, 8@10c. qt. It hardly pays to send wild lines. Gooseberries, $3@5 bbl. as to qual. Cherries are abundant, the State crop and shipments amply making up any deficiency in N. J. or S. I.; fancy oxhearts or tarpparran, 12@14c. lb.; white amber, 5@8c.; sour, 8@10c.; common, 4@5c. Watermelons were never before in such large supply at this early date; sales slow at $20@25 per C. Peaches are quite a feature, and the enlarged Southern product will be very acceptable if the unfavorable rumors about the Del. and Md. crops are well founded; Georgia choice, $4@5 bush.; others, $1.50@2.50; N. C. choice, $3@3.50; other, $1.50@2. Very glowing accounts come from the N. C. orchards, and although the enterprise of sending fruit is young in that State, nurserymen evidently mean business; several points have a setting of 15,000 bearing trees. Hothouse grapes lower; B. Hamburg, 50c. lb.; Sweet Water 30@40c. Peanuts are higher, but trade is dull; Va. hand-picked, $1.60; fine Va., $1.50; good grades, $1.35@1.40.

FLOUR has declined in sympathy with wheat, and also on account of the warm weather being against keeping stock sound.

Latest prices are $3.15@3.85 for very inferior to very choice superfine State; $3.85@4.15 for very poor to very good extra do. and lots and lines; $4.15@4.45 for good to fancy do.; $3.15@3.85 for very poor to very choice superfine Indiana, Iowa, Michigan, Ohio, &c., $3.85@4.15 for inferior to very good shipping extra do. and $4.15@4.45 for very good to very choice extra do.; common to about choice white wheat extras, $4.30@5.40; choice to very fancy do. at $5.50@6.50; red and amber winter wheat, inferior to very choice trade and family at $4.15@5.75; round hoop Ohio at $4.00@4.30, and trade and family brands of do. at $4.35@$5.75, the latter rate for choice, (very choice to fancy lots quoted higher); St. Louis, $4.25@5.00 for very poor to good extra, and $5.00@6.10 for good to very fancy; Minnesota clear, very inferior to very choice at $4.10@5.50; Minnesota "straight," inferior to fancy, at $5.25@6.50, and patent poor to fancy at $5.25@8.00; unsound stock at from $2.00@5.25; city mill extra at $5 00@6.25 for West Indies; do. for England, $3.85@4.00; do. trade and family extras, $5.65@6.75; do. for South America, $5.25@6.00 for fair to fancy; No. 2 $2.25@3.00 for inferior to very fancy.

CORN MEAL.—Sales at $2.60@2.75 for Brandywine, and $2.15@2.35 for Western yellow.

GRAIN.—For wheat prices have been steadily declining on the crop prospects, good weather on the other side and tame markets there. Corn has been held firmly until within two or three days, when the crop reports have weakened prices. Oats are offered lower.

Latest sales of wheat are of ungraded spring at 95@96c.; New York No. 2 spring at 96@97c.; do., June delivery at 97½c.; No. 2 northwest spring July delivery at 97c; No. 2 Milwaukee spring in store at 98c.; No. 1 Milwaukee and Minnesota spring at $1@1.01; No. 2 red spot at $1.05; do., July option at $1.01@1.02; do., delivery by July 27 at $1.05; white State at $1.19; No. 1 white, mainly at $1.15. Rye at 60@63 for western. Corn—steamer mixed at 42@43½c.; ungraded mixed at 41½@41¾c., New York No. 2 at 44@44½c.; New York No. 3 at 41½c.; white western at 53c., and round yellow at 43@45c.; No. 2, June, at 41c.; do., July at 44½c.; do., first half July delivery, at 44½c.; do., August delivery, at 46@46½c.; steamer mixed, June, at 43c.; do., July, at 42½c.; do.; delivery six July, at 43@43½c.; do., August, at 46c. Oats at 1or New York No. 2 white at 33c.; white western at 31@36½c.; mixed western at 30@32½c.; No. 2 Chicago at 30c.; do., July delivery, at 30½@31c.; white State at 31@35½c; mixed State at 30@31½c.; New York extra white quoted at 37@37½c.; New York No. 1 white at 36c.; New York No. 3 white at 31½@32c.; New York extra at 31@31½c.; New York No. 1 at 30½@31c.; New York No. 2 at 30@30½c.; New York No. 3 at 29@29½.

HAY AND STRAW.—The new crop now is expected very shortly, and with large supplies of old yet on hand, prices are easy.

Bale hay, 45@55c. for shipping, and 60@75c. for retail qualities; Straw quoted at 40@45c. for long rye, and 35@40c. for short rye; and 30@35c. for oat.

HOPS.—The shipments for the week have been only 129 bales. The recent advance has been well maintained. Crop reports are rather more favorable, but the stocks of desirable grades are very moderate. Quotations are for New Yorks, good to prime, 10@12c.; do., low to fair, 7@9c.; Eastern, 7@10c.; Wisconsin, 7@10c.; Yearlings, 2@3c.; Olds, all growths, 1@2c.; Pacific Coast hops, 10@12c.

Exports past week, 2,350 bales. Since Jan. 1, 34,100 do.; same time last year, 27,700.

LEATHER.—Sales at 19@20c. for light hemlock, 19@21c. for middle; 20@21c. for heavy and 17@19c. for good damaged.

POULTRY AND GAME.—Live poultry has had one of its favorable fluctuations for sellers this week, and the market closes firm in fowls. Spring chickens have an extra demand for excursions and nearby watering-places since the weather has improved. Turkeys dull, ducks and geese scarcely inquired for.

Fowls.—Spring chicks, N. J., 16@17c.; N. J. choice, 12@13c; Southern and Western, 13@14c.; Roosters, 6@7c.; Turkeys, 10@13.c.; Ducks, Choice, 62@75c. pair, other, 40@55c.; Geese, N. J., $1.25@1.50; other, 88c.@$1.12.

Dressed poultry has a fair demand; not much country-dressed asked for.

Dressed poultry, quoted nominally for country packed as follows: Dry picked Phila., 13@14c.; other fair to prime, including N. J., 11@13c.; Spring Chickens, Phila., 20@22c.; Western, 16@18c.; N. J., 18@20c.; Phila. fowls, 13@14c.; other 10@12c.

Game has no rates except for pigeons; quoted, stall-fed, $1.25@1.50 doz.; flight, 95c.@1.00 doz.; Wild Squab, 70@75c. Tame do., $1.75@2. Items will be more numerous after the Fourth.

PROVISIONS.—Hog products have been stronger under more active demands. Mess pork quoted $10 30@10 60 for spot lots; $10 25 for August; $10 40 for September, and $10 50 for October. Bacon at 5¾c. for long clear, and 6¼c. for short clear. Lard at $7 20 for spot lots; $7 20@7 22½ for July; $7 25@7 27½ for August, and $7 32½@7 35 for September. Steamline at 8 for prime. Tallow at 7 for prime. Beef hams at $21@22 50 for old and new. Beef—For extra mess, $11 75@12; plain mess, $10@11 50; packet, $10 50@12 50 for bbls.; extra India mess, $19@21 for city brands; do. Philadelphia, $18.50@$19.

TOBACCO.—The export demand has been quite brisk. The offerings of the new crop are large, but prices sustained. Quotations are for

WOOL.—The new clips are in large assortment, but a the reports from the country have indicated higher prices there and some little excitement prices here have been very strong. X and above Ohio fleeces have sold here at 35c.; one small lot of Pennsylvania fleeces at 36c.

LIVE STOCK MARKETS.

Saturday, June 29th, 1878.

BEEVES.—Receipts for the week, 9,109 head; do., last week, 11,945 do. Warm weather this week has made wholesale buyers cautious, and the market has not much animation. With a tame market we again report easy figures. Very common to best native steers, 7¼@10½c.; common Texas, 7c.; fair do., 8c.; fat Montana, 7¼@8¼c. Export demand continues steady, using fine stock.

COWS AND CALVES.—There is nothing doing upon which to base quotations.

VEAL CALVES.—The market has declined during the past few days, and at the close 6¾c. is extreme for best milk calves. Course to good grades, 4¾@6c. Buttermilk, 2½@3½c.

SHEEP AND LAMBS.—Receipts for the week 23,171 head; receipts last week 22,406 head. The market is dull at 3¾@4¾c. for sheep and 6@7½c. for lambs.

SWINE.—Receipts for the week 22,811 head; do. last week 28,720 do. No late sales alive. Nominal quotation, 4¼@4¾.

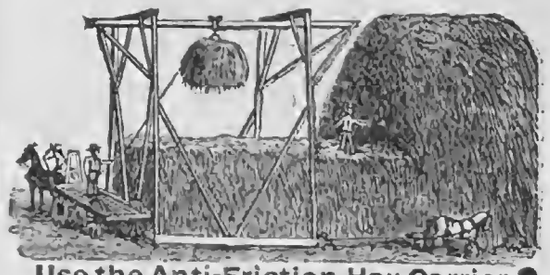
FOR SALE --- FINE DAIRY FARM.

A very fine Dairy Farm of 160 acres, two miles from the city limits of Toledo. In the most farming section adjacent to the city. 100 acres in Grass, 27 acres of Corn and Oats, 15 acres fine Wheat, 18 acres good Timber. Convenient brick residence, with barn and stable for 40 cows. Abundant supply of pure water that never fails. Three apple orchards. A valuable "lolik track," with cows to supply it, if desired. The Farm is on a good road, planked to within ¼ a mile, and is a valuable living for some one. The party now owning the farm has nearly made it clear in the past six years, from the proceeds of his dairy.

Also, a Farm of 320 acres, adjacent a flourishing city in Michigan. The dwelling upon it cost over $20,000. Will be sold for less than the buildings cost.

For further particulars, address

GEO. E. POMEROY & SON,
Real Estate Agents, Toledo, Ohio.



Use the Anti-Friction Hay Carrier.

For elevating and conveying Hay, Grain, etc., in barn, barrack, shed or field. It elevates perpendicularly and conveys horizontally any desired distance. No trouble about getting over high beams and to the end of deep mows or to the top of high stacks. Thousands are now in use. Five tons have been stacked and the frame moved in forty-five consecutive minutes. Fifty tons have been stacked in a single day with this Frame and Carrier. SEND STAMP FOR CIRCULAR. "3" as U. S. WIND ENGINE & PUMP CO., BATAVIA, ILL.

BEST and CHEAPEST.

Buchan's Cresylic Sheep Dip prevents and cures the scab and all parasitic diseases of the skin.

Buchan's Cresylic Ointment is CERTAIN DEATH to the Screw-worm or Grub.

For further particulars, send for Price Lists and Circulars to

KIDDER & LAIRD, 88 John St., New York.

***WEAK LUNGS** are cruelly racked, and the general strength gradually wasted by a persistent Cough, which Dr. Jayne's Expectorant may be relied on to cure. It will certainly benefit you also, if troubled with either Asthma or Bronchitis.*

Reading for the Young.

COATS-OF-ARMS.

It may have occurred to some of my young friends to wonder how those astonishing devices, coats-of-arms, originated. Usually the history is curious. One of those laborious, plodding German students, Dr. Grasse, has been delving into this peculiar lore with interesting results. I propose to tell you of some of them.

Many of you have read and reading, remembered, during the reign of Napoleon III, accounts of the beautiful Princess Metternich, who was a warm friend of the Empress Eugenie. Her husband was the Austrian ambassador near the Imperial Court, and was a very proud person, but his family tree was a not uncommon sapling in the beginning. His ancestor was a plain Captain at the Court of Henry II, and his name was simply Metter. The emperor had the greatest confidence in this captain of his bodyguard, and thereby awakened the envy of certain courtiers, who, imitating the favorite's handwriting, wrote a treasonable letter, and contrived to let this fall, as if by accident, in the emperor's way. The stratagem failed, for Henry had no sooner read it than he quietly put it aside, with the words "*O Metter nicht!*" (No, not Metter!) On the captain's entrance he was greeted by all present with the emperor's exclamation, which, with the slightest alteration, is repeated in the family name.

This was the beginning of his fortune. He presently acquired property which was added to by his successors, until to-day the family is one of the richest and most powerful in the Austro-Hungarian Empire. The famous Joanisberger wine grows on the Metternicht estates, and so highly is it esteemed that a present of a few dozen bottles is considered a great honor.

The family of Andrassy, whose name has of late een so conspicuously before the world, owes its ms to a tournament held at Grau by St. Stephen the year 1000, when he was crowned king of ungary. A foreign knight had unhorsed many ompetitors, and showed himself somewhat inolent in consequence, when a Magyar, of Scythian descent, named Andoras, challenged him to mortal combat. The challenge having been accepted, Andoras, in the presence of the whole assembly, severed the head and right shoulder of his heavily-armed adversary from the body with a single blow. On account of this exploit he was allowed to bear on his shield a man in armor, placed between two lions, erect, who held a crown. Through his subsequent marriage he became founder of the Andrassey family in all its branches. The story is told, however, in another way, with especial reference to a crest representing a Magyar brandishing a sabre. When, we read, St. Stephen was crowned at Stuhlweissenburg in 1100 (*sic*), a strange knight came to him complaining that a lady betrothed to him had fled, and was now in the queen's train. The king promised to repair the wrong if the plaint was just; but learned from the lady, Elsbeth of Elmenau, that her relatives, treating her as an orphan, had assigned her against her will to Willibald of Lundenburg, the complaining stranger, to escape from whose clutches she had fled to the protection of the queen, having bestowed her affections upon another. This was the Magyar noble Andoras, who had seen Elsbeth at the court of Bavaria, while the queen resided there. To settle the dispute, the king adopted the ordinary expedient of a judicial combat, which took place on the following day, when Andoras smote off the head and the right hand of his opponent. He was rewarded with the hand of Elsbeth, and was appointed governor of Transylvania. Of three sons, the issue of his marriage, only one survived, the founder of the house of Andrassey.

KIDNAPPING A SLOTH.

When I first went to live at Larangeiras, which is a suburb of Rio de Janeiro, one of my especial pets was a young sloth. Rather a curious favorite, you may say; but the fact was, that I had heard several travelers deny the possibility of rearing a sloth to recognize and become familiar with you, and I had a fancy to try the experiment for myself.

At first (as might be expected) my native friends made great fun of the idea, and were always asking how my pupil was getting on, and whether I had not better send him to school, now that he was getting too big for a private tutor. However, I stuck to my own way, and in course of time the beast got to know me quite well. Many a time, when I was sitting reading in the garden, under the shade of my favorite palm-tree, I would be startled by feeling a huge hairy paw passed inquiringly along the back of my neck, and, turning round, find myself face to face with Senhor Melhado, as I had named him, in compliment to a very take-it-easy neighbor of mine.

These reminders, I must confess, generally meant getting a bit of sugarcane or a sup of molasses, for he was a shocking "sweet-tooth." When we sat eating our sugareane on the veranda, in the cool of the evening, he used to come for *his* piece as regularly as the clock struck; and whenever he had misbehaved himself, I used to punish him by giving him none. Having got his education to this point, I began to think whether I could not carry it further still, when lo! one fine morning my pet was nowhere to be found.

This discovery was not made till after I had started for the city as usual; but my black retainers were naturally dismayed at a catastrophe, the whole blame of which would evidently fall upon *them*. Moreover, the garden being entirely surrounded by a high wall, and all the trees standing well back from it, it was difficult to imagine how he could have got out. The whole affair had quite an air of witchcraft; and (as is wont to be the case in a public crisis) a great deal was said, and nothing done.

Now, it happened that this same difficulty of getting out was Mr. Sloth's special grievance; for, although one might have thought that long walks were not much in *his* line, he had a great hankering to know what lay on the other side of that wall. And so, one morning, as if on purpose to gratify him, while he was sitting disconsolate upon a projecting bough, there came sliding up over the top of the wall, right towards him, the end of a pole, long, strong, and well-smoothed as heart of sloth could wish.

Slowly and heavily, one after another, the huge clumsy paws fastened upon this unexpeed windfall. But, alas! for the poor beast, he had no sooner trusted himself to his new perch than he discovered that there was a black man in ambush underneath it; and before he could collect his scattered ideas, he found himself whisked up and marched away down the street, to the cry of "*Preguica! boa preguica! Quem quer comprar!*" (Sloth! good sloth! Who'll buy?)

Meanwhile I, little dreaming of what had befallen my poor favorite, was riding leisurely along the great road leading from the suburb of Larangeiras to the city, when I suddenly discovered that I had forgotten some papers which I wanted. To save time, I went back by a short cut through some of the by-streets, and it was just as well that I did, for I suddenly encountered a sloth tied by his claws to a pole, and looking very much ashamed of himself: and in this disconsolate captive I recognized, to my no small amazement, my own cherished pupil, Senhor Melhado!

In an instant I was off my horse, and pounced upon the thief, who loudly protested his innocence. A crowd gathered, and there was a great hue-and-cry; but my recognition of the sloth—and, better still, *his* recognition of *me*—carried the day, and my black friend, seeing the case going against him, abandoned the booty and took to his heels. The delight of my household at the prodigal's return may be imagined; and I think the lesson must have done him good, for he never broke bounds again. D. Ker.

A JAPANESE NEWSPAPER.

Turning over the leaves of a diminutive blue-book of no particular interest, we lighted upon a translation of the six hundred and thirty-third number of the Yokohama Daily News, published on the 20th day, 2d month, 6th year of Meiji, 20th day of 2d month of Solar Calendar; that is to say, Thusday, February 20th, 1873. The date is not of the best, but the contents of the paper have lost none of their savor by keeping.

Compared with more familiar journals, our Japanese newspaper is but lightly laden. Immediately after the date comes the announcement: "Weather fine. Thermometer at noon, fifty-two degrees." This is followed by an official communication from Inouye, vice-minister of the treasury, setting forth the number and description of the ships at anchor in the bay of Yokohama, the amount of customs receipts for the preceding day, the rates of exchange, and a notification that the Budget of News, the Daily Intelligence Association News, and the Yokohama Daily News, being conductive, "be it in ever so slight a degree," to energy and progress, by furnishing correct information about home and foreign affairs, it is ordered that these journals be forwarded daily to every *fen* and *ken*—city and district—in the empire.

As at least one and a half of the four pages of the moderate-sized sheet are devoted to advertisements, the editor of the Yokohama Daily News has very little space at his disposal for chronicling the events of the day. We find only one incident recorded in its columns, but that is a strange one. A Japanese boat in distress being sighted off O'Shima by a British steamer, the captain put his ship about and picked up the six occupants of the boat, just in time to save them from drowning. One of the rescued Japanese, who appeared more dead than alive, had his whole body so scorched and inflamed, that his shirt was sticking to his flesh, and could not be peeled off him. Upon the captain questioning his companions, they stated that, as their boat was running before the wind about noon, this man and another were sitting facing each other, when, all of a sudden, a flash of lightning struck the boat, stunning the scorched man, while the one opposite him was hit right in the head by the lightning, smashed into little bits, and disappeared in the sea. "Foreigners" is the editorial comment, "have a contrivance for warding off lightning strokes, not only at sea, where there is no shelter at hand, but also on every one of their houses. Therefore, our countrymen should adopt this system without delay; if this is done, we shall have no more loss of life and destruction of houses by lightning, such as have heretofore been frequent."

Our journalist gives us a better taste of his quality, when he deals with a bit of social scandal, airing his morality in quaint fashion, as he relates the story of a frail dame, the course of whose love ran anything but smoothly: "Near the Imadobridge, in Asakusa, Yokiyo, there was a restaurant known as the Zumeiro, the proprietress of which was named O'Kiku. This lady, though fully forty years of age, is uncommonly handsome, and of very attractive manners. She is, however, of a fickle disposition, and some years ago was free of her favors to the play-actor, Suwamuro Dossho, in consequence of which she lost her lawful husband, and brought confusion on the household. Still she paid but little regard to censure of the world; and, about four years ago, the pair started off to Œsaka, intending to become man and wife. As she had slipped away from home on the sly, the lady was followed, and was overtaken and brought back by the pursuers when they had got as far as Sogayeki. Thus their intercourse was interrupted for that time. But within the last year or so they drew together again; and as love brooks no denial, the lady called in her go-between, and arrangements were made for the marriage. However, on the very night before, a fire broke out in her house, and it together with four or five houses adjoining, was burned to the ground. In consequence, the bridal preparations have had to be postponed. It is said that O'Kiku cares very little either for her own or her neighbors' losses by the fire, but that she is inconsolable because the mischance has marred her nuptials.

As regards the tender passion between the sexes, it were useless to enter upon the question of wisdom or folly. Just as in old times, so now, the cleverer the man the greater fool he makes himself; but when women like the O'Kiku, whose brows are beginning to wrinkle with age, forget, for the sake of a young spark, their family and household ties, Heaven visits them either with a fire, as in this case, or with some other calamity. As for Dossho, his family cognomen of Edderburnhouse is only too likely to be changed into Wed-her-burnt-house. Surely a man ought to guard against so scathing a fire as that!"

The Daily News complains that lottery-boxes, called "your fortune," are allowed to be placed outside fanes and temples, out of which a numbered stick is shaken, and a ticket marked with the same number, foretelling good or bad luck, sold to the devotee; while close at hand stands a fortune-reader, prepared to explain the drift of the lot, who, by talking confidentially about life and death, so frightens ignorant folk that he can extort money from them at his pleasure. "Unless these fellows," says the Daily News, "are put down by the government, it is not likely that this superstitious abuse will cease." "Such improper things as fortune-telling and saying prayers ought, as a matter of course, to be suppressed."

The Puzzler.

ENIGMA OF GENERALS.

I am composed of 96 letters:

My 48, 2, 17, 35, 18, 19, 5, 46, 1, 53 a Confederate general.
My 33, 7, 10, 13, 14, 68, 59, 8, 20 a Union general.
My 3, 28, 47, 36, 64, 11, 89, 16, 23, 21 a Confederate general.
My 57, 88, 91, 74, 26, 4, 77, 25 a Union general.
My 96, 34, 48, 30, 1, 22, 44, 15, 49, 56 a Confederate general.
My 88, 70, 24, 52, 93, 90, 58 a Union general.
My 43, 12, 6, 31, 9, 76, 81 a Confederate general.
My 10, 37, 63, 33, 40, 84, 75, 47 a Union general.
My 86, 51, 65, 54, 69 a Union general.
My 27, 32, 60, 18, 41, 39, 62, 3, 15 a Confederate general.
My 29, 73, 1, 61, 80, 89 a Union general.
My 42, 82, 83, 77 a Confederate general.
My 66, 85, 63, 89, 92, 20, 71 a Confederate general.
My 45, 87, 74, 67, 50 a sort of shell.
My 73, 95, 78, 94, 55 a masticator.
My 79, 72, 10 a pronoun.

My whole defines religion.

☞ Answer in two weeks. Floridian.

ENIGMA.

I was there with good Eve 'mongst her fruits and her grass,
And with old Tubal Cain when he molded his brass;
And I saw the rude cross on which Christ hung to die,
Nor was far from the tomb where so many did lie.
I have sailed the rough ocean, and crossed the wide plain,
And have climbed the high mountains where men seek for gain.
Quite at home with the prince in his purple and gold,
And enjoy with the vulgar his squalor and cold.
I've always loved women far more than the men,
So tell me this riddle as soon as you can.

☞ Answer in two weeks. E. S. Hulin.

FRACTIONAL PUZZLE.

1. One-tenth of strawberry. 2. One-quarter of date. 3. One-fifth of lemon. 4. One-sixth of squash. 5. One-fifth of prune. 6. One-seventh of apricot. 7. One-eighth of plantain. 8. One-sixth of damson. Take one from each and form a fruit.

☞ Answer in two weeks. May.

HOUR-GLASS PUZZLE.

1. Northern. 2. A city of New England. 3. A town of Long Island. 4. To bury. 5. Possessive case of a pronoun. 6. A consonant. 7. Overtook. 8. An ante-room. 9. The Blessed Virgin. 10. A town of Vermont. 11. A man worth several millions. Centrals form a town of Vermont.

☞ Answer in two weeks. Little One.

PUZZLER ANSWERS.—June 22.

Hidden Apparel.—1, Garter; 2, Pinafore; 3, Bib; 4, Belt; 5, Sash; 6, Ruffle; 7, Sandal; 8, Pannier; 9, Cuff; 10, Dolman; 11, Shirt; 12, Shoe; 13, Boot; 14, Slipper; 15, Smock; 16, Shift; 17, Chemise; 18, Socks; 19, Spencer; 20, Stomacher; 21, Drawers; 22, Surplice; 23, Suspenders; 24, Polonaise; 25, Redingote.

Cross-word Enigma.—Henry W. Longfellow.

Hidden Names.—1, Rosa; 2, Mabel; 3, Eve; 4, Ann; 5, Irene; 6, Emma; 7, Kate; 8, Bertha; 9, Ella; 10, Carrie.

Classical Double Acrostic.—Initials, Leverna; finals, Nemesis.

Transposition.—

The warm summer rain
Comes trickling down the window pane,
Bursting the buds of the climbing rose;
Welcome summer rain.

Sabbath Reading.

WORDS OF STRENGTH.

BY SCHILLER.

There are three lessons I would write—
Three words as with a burning pen,
In tracings of eternal light,
Upon the hearts of men.

Have hope. Though clouds environ now,
And gladness hides her face in scorn,
Put thou the shadow from thy brow—
No night but hath its morn.

Have faith. Where'er thy bark is driven—
The calm's disport, the tempest's mirth—
Know this—God rates the hosts of Heaven,
The inhabitants of earth.

Have love. Not love alone for one,
But man as man thy brother call,
And scatter like the circling sun
Thy charities on all.

Thus grave these lessons on thy soul—
Hope, Faith and Love—and thou shalt find
Strength when life's surges rudest roll,
Light when thou else were blind.

"ROCK OF AGES."

The hymn beginning,

"Rock of Ages, cleft for me,"

may well be esteemed one of the brightest gems of Christain psalmody.

It is a grand tone that nerves and strengthens faith, that associates the sublime imagery of the Hebrew Scriptures with the all-protecting love of Christ, and that has consoled thousands of Christians in the dying hour.

Augustus Montague Toplady, the author was born at Farnham, Surrey, England, in 1740. His father fell at the battle of Carthagena, and he was brought up in charge of an exemplary and pious mother. He was educated at the Westminister school.

At the age of sixteen, Toplady chanced to go into a barn at an obscure place, called Codymain, Ireland, to hear an illiterate layman preach. The sermon made upon him an unexpected impression and led to his immediate conversion. He thus speaks of this interesting experience in his diary: "That sweet text, 'Ye who were sometimes afar off are made nigh by the blood of Christ,' was particularly delightful and refreshing to my soul. Strange that I, who had so long been under the means of grace in England, should be brought nigh to God in an obscure part of Ireland, amidst a handful of God's people met together in a barn, and under the ministry of one who could scarcely spell his name. The excellency of such power must be of God and cannot be of men."

He became a minister of the church of England, maintained the Calvinistic doctrines in opposition to the Wesleys, and preached and wrote with self-consuming zeal. The only blemish of his high character was heated language and intolerance in controversy.

In the year 1775 his health began to fail. It was evident that the sword was too sharp for the scabbard. His physical energies were being destroyed by the fiery ardor of soul that over-taxed them. His physician commanded him to go to London. Here a new field opened before him, and he became pastor of the French Calvinist Reformed Church.

On the year of his settlement in London, he published in the *Gospel Magazine* an article, entitled "Questions and Answers Relative to the National Debt," in which he adverts to the debt of sin, and shows how multitudinous are the sins of mankind. By numerical calculations, he exhibits the enormity of the debt of the redeemed soul, which Christ has canceled, and impresses the readers with the transcendent love and value of Christ's atonement. With these thoughts growing like a vision in his mind, he then added:

Rock of ages, cleft for me,
Let me hide myself in thee;
Let the water and the blood,
From thy riven side which flowed,
Be of sin the double cure,
Cleanse me from its guilt and power.

Not the labor of my hands
Can fulfill thy laws' demands;
Could my zeal no respite know,
Could my tears for ever flow,
All for sin could not atone,
Thou must save, and thou alone.

Nothing in my hand I bring,
Simply to thy cross I cling;
Naked, come to thee for dress,
Helpless, look to thee for grace;
Foul, I to the fountain fly;
Wash me, Saviour, or I die.

Whilst I draw this fleeting breath,
When my eyestrings break in death;
When I soar through tracts unknown,
See thee on thy judgment throne,
Rock of ages cleft for me,
Let me hide myself in thee.

The above is the original version, from which it will be seen that the hymn in common use has been greatly transposed and altered.

It was composed in Toplady's last years, when he already felt that he was beginning to lose his hold on life, and that his feet were already standing on celestial altitudes. Some two years afterwards, when he was yet but thirty-five years of age, the full time of his departure came, and he found the prayer in the last stanza of this hymn fully and sweetly answered in the revelation of Divine love to his soul. He seemed to walk in Bulah, to breathe immortal airs and to hear the tuning of unseen harps, and by faith to discover what the Protomartyr saw and the Revelator described.

"Your pulse," said the doctor, "is becoming weaker."

"That is a good sign," said Toplady, "that my death is fast approaching, and I can add that my heart beats every day stronger and stronger for glory."

As his end drew immediately near, tears of joy filled his eyes, before which already seemed to pass visions of Paradise, and he exclaimed: "It will not be long before God takes me, for no mortal can live after the glories God has manifested to my soul."—*Story of the Hymns by American Tract Society.*

PERSONAL ITEMS.

Garibaldi gets his mail once a week, and it generally averages six hundred letters and as many papers.

Mr. Ross says it has cost him $80,000 not to find his lost Charlie. A good many men would gladly lose all their boys for half the money.

The center of public curiosity at Berlin just now is Lord Beaconsfield, and his hotel is visited daily by hundreds of people to get a sight of him.

Marshall McMahon has intimated to Gen. Grant that he may visit this country a couple of years hence, when his present term of office is ended.

A daughter of Brigham Young has lately married a man who, during her father's life time, had the care of his horses. She is young, pretty, and has $20,000.

A tall, slender, fine-looking man is Mr. Charles Reade, the famous novelist, with gray hair and a moustache; a broad forehead, and a peculiarly dilating blue eye.

Major Forsyth, General Sheridan's chief of staff, has been promoted to the rank of lieutenant-colonel and ordered to join his regiment in Washington Territory.

Mrs. Jenks thinks Butler "is just beautiful," and "when he smiles he is perfectly lovely." But "when he sits up straight and tries to look important, then he is simply horrid."

Senator Bruce, Mississippi's colored Senator, just married, was formerly engaged to the daughter of a highly respectable colored family of Cleveland, O., named Vosburg. The "happy pair" have gone on a four months' trip to Europe.

Mrs Swisshelm has been preaching a sermon for tramps. She believes that all honest work is its own exceeding great reward. We should like to see Madame Swisshelm at an intelligence office trying to hire a stout Irish girl on those terms

The author of the once famous Confederate song, "Maryland, my Maryland," is Mr. James R. Randall, now associate editor of the Augusta, Ga., Chronicle. He is a native of Baltimore, thirty-nine years of age and a gentleman of polished manner.

Mrs. Fry, of Oswego, has been smoking tobacco altogether too much of late. She is nearly one hundred and eight years of age, but still her physician thinks she is not old enough to care for herself properly, and has cut down her daily allowance.

Dr. J. C. Ayer, the millionaire pill man, who has been at Dr. Russell's insane asylum at Winchendon, Mass,, for a year past, is said to be gradually failing. His disease has reached the placid state, and he does not suffer, but his mind is wholly wrecked.

Thurlow Weed is one of the largest and most muscular of the editorial fraternity. This remark of course applies to his earlier days, for he now feels the effect of time. He is just three years younger than Bryant, having been born in 1797, and considering his age, he is in remarkable preservation.

The lady formerly known as the Princess Salm-Salm, who figured so conspicuously in this country and Mexico some years ago, is now prominent in the divorce courts of London, seeking a separation from her husband, Mr. Heneage, a promising diplomat, who willingly agrees to a separation, but demurs to the alimony.

Oxford, which made Grant a doctor, is now about to confer the honorary degree of doctor of common law on Edwards Pierrepont. Next to the conferring of a patent of nobility on that elegant and culchawed gentleman, nothing would probably give him more satisfaction than this recognition by Oxford. Carry the news to "dear Mary."

"Mais, monsieur le presidong," said General Grant, "you will be toujours le marechal de France, while I am jamais lo general, but a plain citoyen." "But ze fame of your grande battailles will make you always live in ze hearts of ze peuple as ze marshall d'Amerique," replied McMahon. "Ah, qu'estce que c'est your donnezing us; taffy?" inquired Grant.

Edward S. Rand, Jr., the swindling lawyer and horticulturist of Boston and Dedham, Mass., who fled from justice a year or two ago, is at Juraty, South America, on the south bank of the river Amazon, 700 miles in the interior. He is associated with a Portuguese in exporting rubber, gums, dyes, etc., and has every prospect of amassing a fortune, which he promises to come home and spend in paying his creditors.

There is a touch of pathos in General Fremont's remarks upon his appointment as Governor of Arizona. He expresses himself as extremely gratified at this mark of favor from the President, and says that his has been a checkered career, filled with much honor and misfortune, and that he is convinced that the only course left for him is to begin life anew. Mrs. Freemont is said to fully sympathize with her husband's new ambition, and she will share with him the honor of his new position.

Mrs. Agnes D. Jenks, the spicy witness in the Potter inquiry, is a woman about 35 years of age, with a good figure, blonde complexion, a full, round face, and is rather good-looking. At her examination, recently, she was plainly and neatly attired in a dress of light material made to fit her closely, and wore a dark turban hat. During the progress of her testimony she exhibited a knowledge of Louisiana politics that bore out the remark made by her husband, to the effect that "Mrs. Jenks was prominent in politics in Louisiana." She spoke clearly and distinctly, her slight Creole accent falling pleasantly on the ear. This accent has been mistaken for French, but the female political trickster is Scotch-Irish.

Wit and Humor.

THERE is no vegetable that can ketchup with the tomato.

THE honest sausage-maker never fails to make both ends meat.

THE man that went up in a whirlwind out West "came down with the dust."

GOOD partners at cards—a chimney-sweep and a bugler. One can follow soot and the other can trumpet.

THE Norristown Herald insists that no man likes to hold a girl baby in his arm until she is seventeen years old.

A CLERGYMEN says: "A young women died in my neighborhood yesterday, while I was preaching in a beastly state of intoxication."

A BEAUTIFUL widow of Newport, R. I., having let her chalet for the season, was asked what induced her to desert such a charming retreat. "Too much balcony and too little Romeo," was her reply.

A MONKEYISH letter—ape X. [*Keokuk Constitution.* A sharper letter—keen O. [*Cincinnati Saturday Night.* A noisy letter—blue J. [*Philadelphia Bulletin.* A stinging letter—bumble B. [*Boston Post.*

An Irishman who stood near the third base watching a game of base-ball was sent to grass by a foul which struck him under the fifth rib. "A fowl, wuz ut? Begorra I thought it wuz a mule."—*Boston Pilot.*

ELIZABETH ALLEN, in a poem, asks, "Oh, willow, why forever weep?" Elizabeth is a little mistaken as to the facts. It isn't the willow that weeps; it is the boy who dances under the limber end of it.—*Burlington Hawkeye.*

A WIDOW in the west, intending to succeed her husband in the management of a hotel, advertises that "the hotel will be kept by the widow of the former landlord, Mr. Brown, who died last summer on a new and improved plan."

A MICHIGAN school teacher received the following unique excuse from a pupil's mother: "pleas Excuse Minnie for she was helping me. She is a grate help to me thou Small she may be I would miss hur if the Lord should call hur at any time and oblige Mrs. B——."

A MINISTER was riding through a section of the State of South Carolina, where custom forbade innkeepers to take pay from the clergy who stayed with them. The minister in question took supper without prayer, and ate breakfast without prayer or grace, and was about to take his departure when "mine host" presented his bill. "Ah, sir," said he, "I am a clergyman!" "That may be," responded Boniface, "But you came here, smoked like a sinner, and ate and drank like a sinner, and slept like a sinner; and now, sir, you shall pay like a sinner."

AN intelligent farmer living in Des Moines County has invented a henophone, modeled on the principle of the telephone, by which one reliable old hen occupying a central office in the henmory, sits on all the nests about the establishment, leaving the other fowls free to lay, scratch, and cackle. As fast as a new nest contains the full complement of eggs, it is connected with the central office by a copper wire, and the business is settled. The only trouble with the machine is that it sits so hard it hatches out the porcelain nest eggs along with the others, so that one chick in every nest is born with glass eyes, and the farmer has to buy and train a dog to lead it around. This makes it expensive.—*Burlington Hawkeye.*

An Important Function Stimulated.

The kidneys exercise most important functions, which are so wearisome that they tax to the utmost the strength and endurance of these busy little organs. Every breath, every pulsation of the heart, every movement of a limb, every thought, makes waste and necessitates the development of new atoms. The used up particles in the blood are sifted from it and dissolved in a watery fluid by the kidneys, which then discharge this fluid into the bladder. A train of disasters to the system would follow if these "ashes," so to speak, were not thoroughly strained off and discharged. This is the case when the kidneys become inactive. Hostetter's Stomach Bitters, by restoring their activity, not only keeps open a most important outlet for impurities, but prevents diseases of the kidneys themselves, which when inert become liable to fall a prey to diabetes, Bright's disease, nephistis albumenuria, and other maladies specially incident to them, which, although not specially rapid in their progression, are particularly obstinate and fatal.

The Herdsman.

THE JERSEY HERD OF MR. H. S. PARKE.

BAY-SIDE is one of the most delightful spots on Long Island. It is just at the mouth of Flushing Bay, and commands views of the Bay and East River just at its *debouchment* into the Sound. The far-off Connecticut shore looms through the mist, or stands out clean-cut, showing its varied coast-line of rock and meadow and bay, flecked with the white sails which one can hardly distinguish, in the extreme distance, from the granite rocks. Nearer one sees the eastern headland of the bay crowned with wood; opposite, the green slopes of Fort Schuyler, and, quite in the foreground, the garrison flag at Willet's Point waves above the trees.

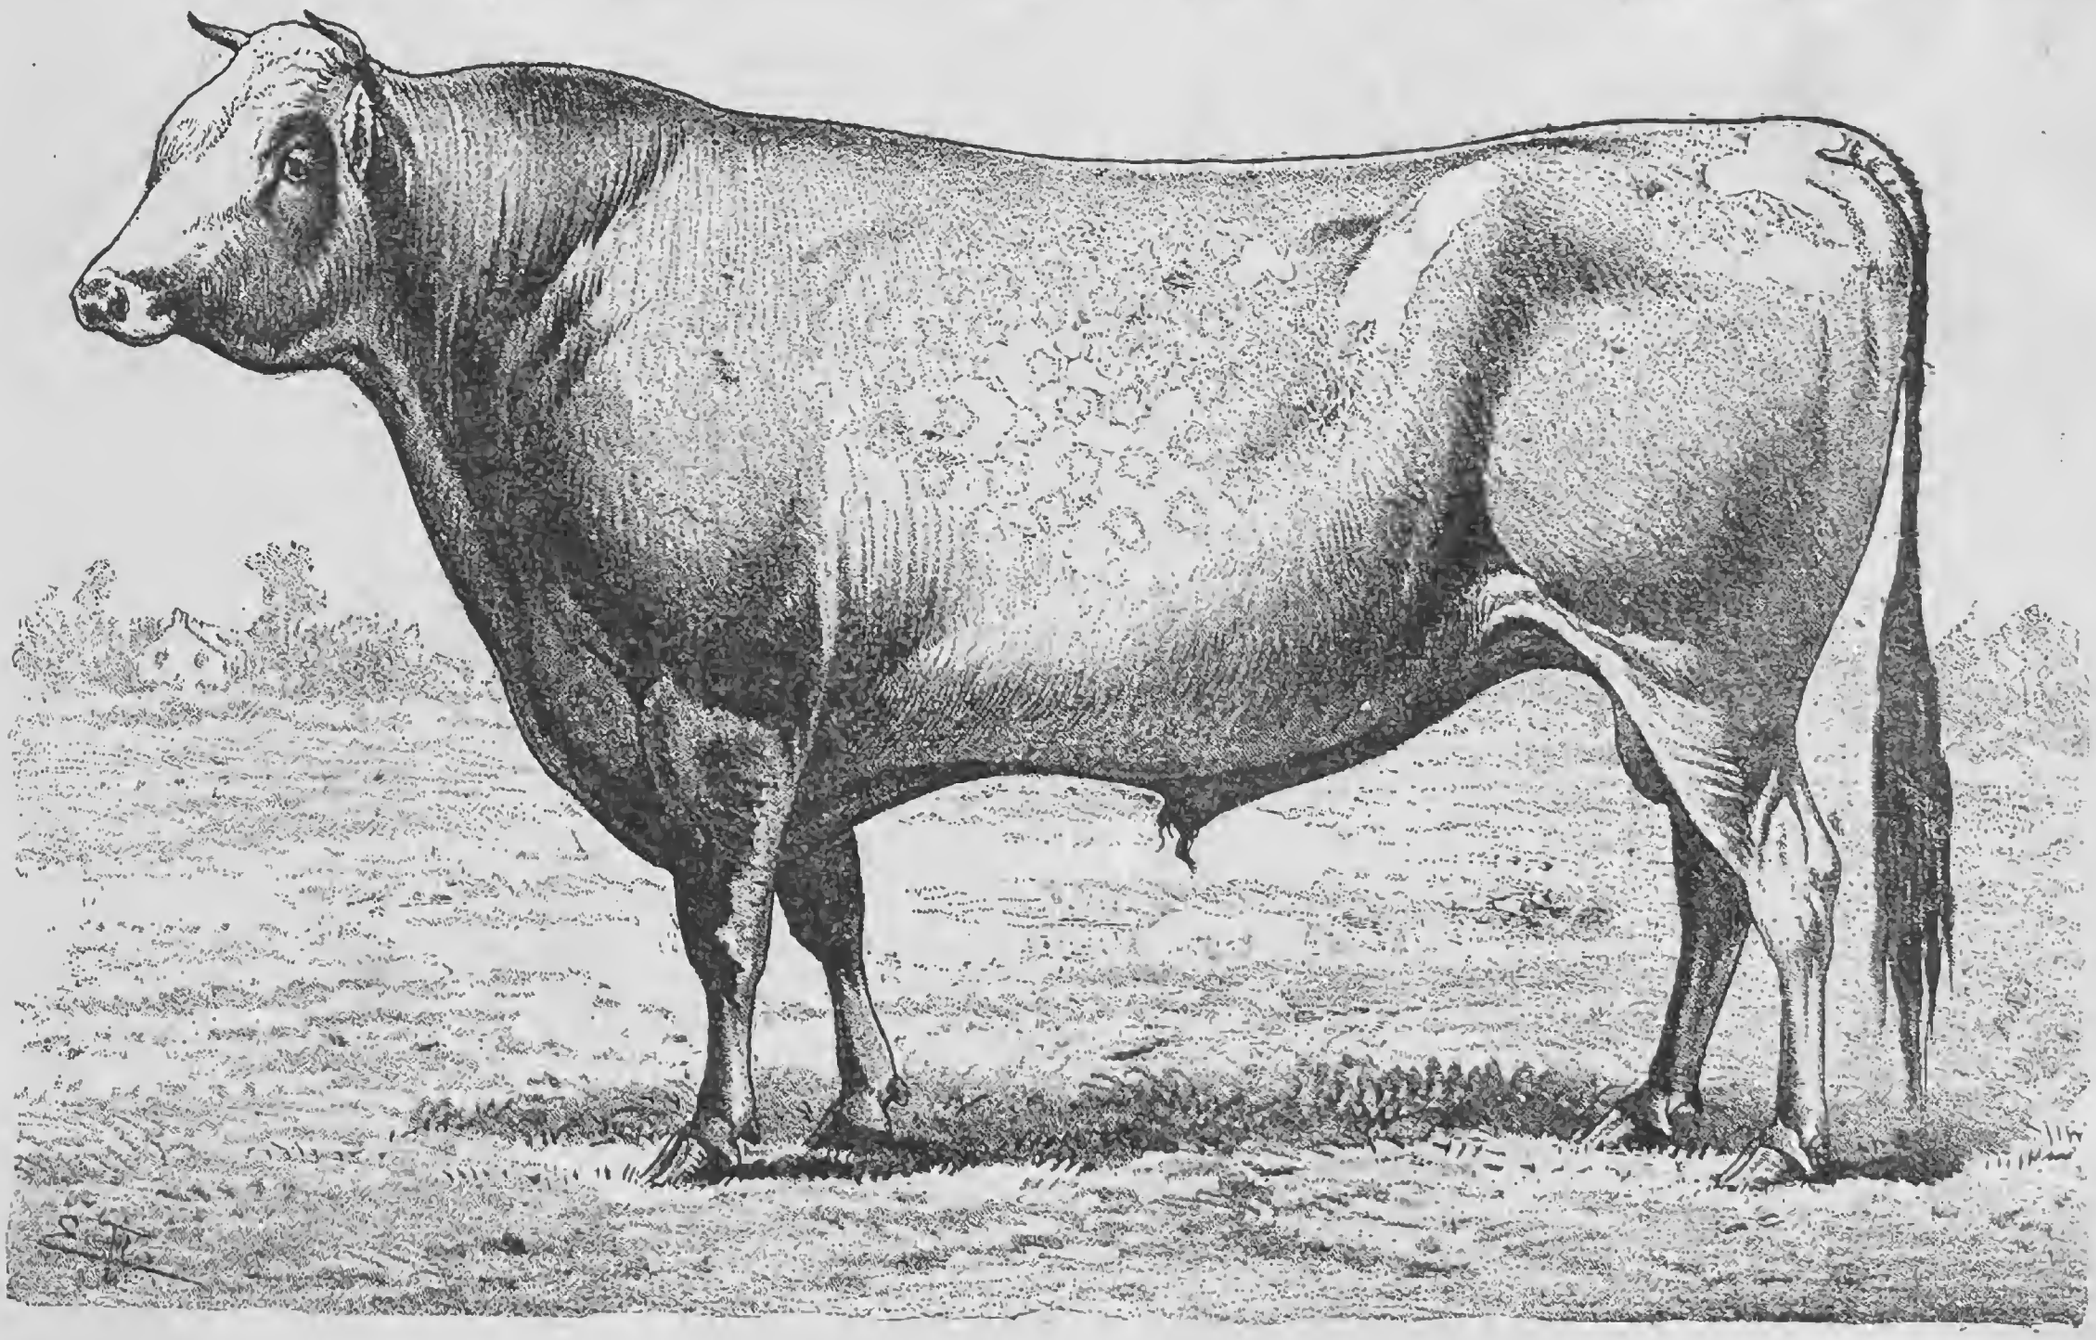
This is our remembrance of the view from the piazza of Mr. Parke's house, an old-fashioned shingle-sided mansion, laid out with a breadth and liberality of hall-ways, and a general spaciousness, indicating cheerful views of life and home comforts. Far too pleasant a home for an old bachelor, if a bachelor can be said ever to have a home, other than that of his childhood. One is struck with the excellence of the deep alluvial soil, as it is evinced by the growth of trees about the house, most noticeable among which, is a group of Pines obviously planted as lawn trees and rather crowded, now towering up, naked boles, without a branch within 20 or 30 feet from the ground, having, we should think, diameters of eighteen inches to two and a half feet.

The Bay-Side herd of Jerseys was established by Mr. Parke by the purchase of a number of the best of the dark-colored, solid, black-pointed heifers and young cows that he could buy, confining himself, in a good measure, to what was then the most fashionable type, and heading the herd with "Son of Alphea," who, like his famous dam, was solid with black points and of the richest quality. They were altogether decidedly above average excellence, but this was hardly satisfactory, and rightly or wrongly, Mr. P. took a prejudice against solid-colored Jerseys that had not more substantial merits. Going to the other extreme, he added "Young Duchess" to his herd, a heifer imported in dam by Charles Sharpless. She proved a great milker and butter-maker, having repeatedly yielded over 15, and once over 16½ pounds of butter a week. She is, however, lacking in personal beauty—spotted, flecked, and speckled like an Ayrshire; breeds well, however, and has been a valuable animal in the herd.

Gradually, by purchase, by breeding, and by weeding, Mr. Parke has reduced his herd in numbers and improved it in quality, until now it is really one of the most beautiful as well as most useful herds in the country. In fact, we know not of its equal in both particulars.

Young Duchess 497, now no longer young, sets off the beautiful proportions and colors of her younger sisters of the herd to good effect. Bluebird 599, a blue-gray cow, with some white, not herself a great milker, but very rich, is a fine large-bodied animal and a great beauty. Annie Paige 2,690, is famous for having milked ten months before she had her first calf, which occurred when she was 21 months old. She is now giving eleven pounds one ounce of butter per week, and weighs just 800 lbs. The rest of the herd are very beautiful and above the average as butter-yielders, characterized by particularly delicate and beautiful horns and heads.

JERSEY GOLDDUST 2134.—Two years ago, Mr. Parke had Col. M. C. Weld, of New York, select for him, upon the Island of Jersey, a yearling bull, to be of a yellowish fawn color, and of a form to meet the demand of his critical eye. It seems remarkable that he could have been so entirely pleased with his purchase. The portrait which we give of him, by Edwin Forbes, is a fair one; in no sense flattering, and yet representing a very handsome Jersey bull. He is of a solid creamy fawn color, with black points, more or less dappled upon the sides, with very delicate horns, dishing face, very long, broad and deep-bodied, straight-backed, very fine in bone, with superb muscular development; altogether, a perfect beauty, and of a mild and quiet disposition. His son, Jersey Golddust 2d, a year old in April, is very like his sire, but considerably larger for his age, and sure to make a very large and fine animal. He is also of a solid creamy fawn color, inclining to gray on neck and head.



JERSEY GOLDDUST 2134.

FAT-STOCK SHOW AT CHICAGO.

I SHALL be disappointed if the show of fat stock appointed to be held in the inter-State Exposition Building, Chicago, Dec., 2-7, next, under the auspices of the Illinois State Board of Agriculture, does not prove one of the most useful Agricultural Exhibitions ever held in America. The prize-list has just been made public; and while it is not just such a one as I should have prepared, it offers liberal inducements for the owners of fat-stock of superior excellence to exhibit them—more especially as the exhibition and prize-taking will directly add to their selling price, in almost all cases. The aggregate of the regular prizes, to which it is probable considerable additions will be made by special prizes offered by breeders or special friends of each class—amounts to $3,350. Of this sum $1,875 will be awarded to cattle; $725 to sheep; $580 to hogs, and $180 to poultry and game. For cattle: there are classes for Short-Horns, Devons, Herefords, "other pure breeds," grades and crosses. In each a prize of $25, with a second of $15, is offered for steer over four, between three and four, and between two and three years; with first prize of $50 and second of $25 for cow over three years. In "sweepstakes," a prize of $50 is offered for steer of each age; with $100 for a cow. A special prize of $200 is offered for best steer or cow in show; and a first of $200, with second of $150 for best car-load of cattle. It will be possible for the exhibitor of a single cow to secure $350.

In sheep the classification is into long-wool, middle-wool, fine-wool, and grades or crosses, with premiums of $15 and $10 for wethers and ewes and lambs, with liberal sweepstakes. In swine the classsification is into large breeds, small breeds, and grades or crosses, with prizes of $20 and $10 for best specimens of the usual ages, and quite liberal sweepstakes prizes. The National Live Stock Journal offers "Challenge Cups," of value of $100 and $50 each, for best beef animal, best fat sheep and best fat hog shown.

It is not unnatural that many should look on this show as purely a local affair—at most something in which the farmers of the West may be interested; but this feeling is a mistaken one. It is hardly to be expected that feeders or breeders in the Eastern States will become exhibitors, but they have a quite direct interest in this show nevertheless. The East eats Western beef; the Eastern breeder and feeder are directly in competition with their fellows in the West, and now both are being brought into competition with British meat producers. I count it quite as important to the Eastern stock-grower

as it is to him of the West, that the newly opened market for fat cattle and fresh meats, which we have found in Great Britian, shall be developed as fully and as speedily as is practicable, and the influence of such an exhibition as that arranged for at Chicago, will be an important factor in developing this trade. We have more good cattle in this country than most of our British friends believe, and it will do good to collect together a large number of the best specimens.

But, aside from this, there is another field in which such a show will do much good—that of educating our own people. There are still many thousands of farmers who do not really believe there is any advantage in "improved stock"; who do not appreciate the value of such stock. Somewhat indirectly, it is true, but still in an important sense, a first class show of first-class fat stock will be an educator to such persons; perhaps more so than are the exhibitions of breeding stock at our fairs. Again the show will give a capital opportunity for testing the correctness of the claims made for different breeds. If the Hereford will make a better fat ox at a given age than will the Short-Horn; if the Cotswold is to be preferred to the Leicester for fattening: if there are better breeds than the Poland-China, the fat-stock show will give opportunity to demonstrate these things.

No agricultural event of the year is more important, in its way, in England, than is the fat-stock show at Smithfield, London. It will not so be counted at the first, but I believe in the future we will regard such exhibitions as among the most important of our agricultural shows, and that the Illinois State Board of Agriculture will look back with pride to this first exhibition of the kind held in this country. I hope it may receive the attention its importance demands from the East as well as from the West.

G. E. MORROW.

Illinois Industrial University, Champaign.

THE sale of Bow Park Short-Horns at Brantford, Canada, July 11, under the auspices of the Canada West Farm Stock Association will comprise forty head of thoroughbred cows, heifers and bulls, all registered, or entitled to registry in the American Herd Book, besides Cotswold and Leicester sheep, and Berkshire swine. Details will be found in our advertising columns in this issue.

Farm Economy.

DRAINAGE.

R. C. CARPENTER.

DISCHARGE OF DRAINS COMPARED WITH THE RAINFALL.

To ascertain the law which governs this matter, Mr. J. BAILEY DENTON, in the year 1856-7, caused observations of rainfall and discharge from drains to be taken during the months of October, November, December, January, February, March, April and May. The area experimented upon consisted of two kinds of soil: first, soil of a mixed nature, consisting of clay gravel and sand; and second, a very stiff clay considered hard and almost impenetrable. The mixed soil was drained by occasional and wide parallel drains sufficient to discharge the rainfall and deep enough to relieve the pressure of subterranean water. The clay soil was drained uniformly by a parallel system of drains four feet deep and 25 to 27 feet apart. The total cost of draining the 800 acres included in the area experimented on was £3,357 10s. or $16,787. The discharge from the open soils was more regular than that from the clays, probably because of their greater distance apart.

The rainfall per acre was 227,240 gallons, and the discharge per acre on the mixed soil was 160,920 gallons, or about 71 per cent. of the rainfall; on the clay soil it was 59,936 gallons, or about 21 per cent of the rainfall. The reason why clay discharges less than loam is doubtless found in the fact, that it has greater power of retaining water by capillary attraction; thus Professor SCHUBLER, of Tubingen, found that 100 pounds of dry soil would retain the following amount of water, that would not flow off:

Sand	25 pounds.
Loamy soil	50 "
Clay loam	50 "
Pure clay	70 "

Observations conducted by Mr. JOHN DICKINSON, of England, for eight years gave the following mean values of the discharge as compared with the rainfall: October to March, 75 5 per cent; April to September, 7.1 per cent; average 42.4 per cent. Mr. TRACEY, in 1849, made some experiments in regard to the drainage of certain valleys near Boston, and concludes that the discharge varies from 45 to 44 per cent. of the rain-fall.

COMPUTATION OF TABLE FOR DRAINAGE.

From the tables for rainfall we see that showers exceeding one inch are rare, but that about one-fourth of our rain falls in these heavy showers. From that it is safe to conclude that if the drains are capable of conveying away the water that reaches them during the next 24 hours after a rainfall of one inch, little or no surface water will remain on the land during any portion of the year.

The amount of discharge as compared with the rainfall depends upon so many conditions, that it cannot be accurately stated; but probably will seldom or never exceed 50 per cent of the rainfall during the next 24 hours, under any conditions. In order to produce thorough drainage—that is, to so drain land that surface water shall not exist on it on an average longer than six hours oftener than once a year,—it is necessary to assume that the capacity of the drains should be sufficient to carry off, during 24 hours, one-half the water that fell the previous 24 hours. The probability of the rainfall in any day exceeding one inch, is so slight that we shall be safe in assuming the greatest ordinary rainfall to be one inch in 24 hours, and the necessary carrying capacity of the drains, one-half inch for the same time. One inch of rainfall produces 3,630 cubic feet per acre, consequently our drains, to produce under all conditions thorough drainage, should be able to convey 1,815 cubic feet of water for each acre drained.

The results in the following table accord well with my experience regarding the size of drains necessary to produce thorough drainage. Thus in the west portion of the College grounds is an area of a little less than nine acres, thoroughly drained with drains 60 feet apart. The fall of the main is 1 in 200, and it is a 4-inch tile. This is none too large, for the drain runs full several weeks each spring, and considering the perfect manner in which it works, I feel justified in considering it the proper size. Until a very recent date we did not proportion the size of the tiles to the area to be drained by the following table, and we have several instances where the drains are entirely inadequate for the work imposed on them. For instance, the main drain to the orchard, which was built several years ago, has an inclination of 1 in 200, and is a 6-inch tile. The whole area to be drained through this main is not far from 40 acres. The drainage from this area is conveyed to the main by laterals with a considerable fall. The result has been that for days at a time, although the main was running full, water has stood on the surface of the ground directly over it, in several places.

For ordinary farm drainage, where the drains are simply to run under the low places on the surface of the fields, the water will be longer in reaching the drains, and consequently the acres drained by a given sized tile may be increased with perfectly satisfactory results. Again, if flooding is of little moment for a few days at a time, it may receive another corresponding increase. I would recommend that the areas in the following table be doubled, for ordinary farm drainage, but they must be changed with caution if thorough drainage, such as a gardener would need, is desired.

TABLE FOR SIZE OF TILE.

RATE OF INCLINATION.	ACRES DRAINED (THOROUGH DRAINAGE). 2-inch Tile.	3-inch Tile.	4-inch Tile.	6-inch Tile.	8-inch Pipe.	10-inch Pipe.	12-inch Pipe.
1 foot in 21	6.7	18.6	26.8	74.4	150.0	270.0	435.0
1 foot in 30	5.5	15.1	21.8	60.4	136.0	220.8	346.6
1 foot in 40	4.7	13.9	18.6	51.6	108.8	189.6	288.4
1 foot in 50	4.3	11.9	17.0	47.7	98.0	169.4	253.4
1 foot in 60	3.9	10.9	15.9	43.4	90.0	150.4	229.0
1 foot in 80	3.6	10.0	14.5	39.9	81.6	144.4	228.1

1 foot in 1000	0.9	2.6	3.7	10.2	21.2	36.5	60.0
1 foot in 1500	0.8	2.1	3.0	8.5	16.8	30.5	47.0
1 foot in 2000	0.7	1.9	2.8	7.4	15.0	25.7	43.8

To afford a simple rule for those who wish to construct drains simply through the low places of a farm, and who do not possess means of ascertaining the fall, the following will probably be sufficiently accurate:—On the average the fall usually secured is about one in 200, and for ordinary farm drainage, doubling the results given in the table, we find that a drain of 2-inch tile will drain four acres; 3 inch tile will drain 11½ acres; 4-inch tile will drain 16½ acres; 6-inch tile will drain 45.6 acres; 8-inch tile will drain 96.0 acres; which rule does not differ essentially from the one given by Waring in his work on Farm Drainage. The above rule is for casual, not thorough drainage.

GRADE OF THE DRAIN.

From what has already been said in reference to the capacity of a drain, it is seen that the greater the fall the greater is the amount of water that will pass through in a given time, other things being equal. For this reason the fall should be as great as possible within certain limits. It is possible to have drains so steep that the water, instead of entering the drain at the joint, will run along the outside of the tile, and finally undermine and destroy the drain; this danger is to be anticipated only for large drains where there is a great deal of water, and never for small drains, which serve only as feeders. The limits of steepness for main drains that convey much water, we may put at from one in ten to one in thirty, depending on the tenacity of the soil. The least grade admissible depends entirely upon the mechanical execution. Drains cannot be laid like water pipes, alternately descending and ascending, but they must descend continuously from their commencement to their outlet. If laid with any portion ascending from the commencement, even though that portion may not rise above the head, the drains, not being tight, will let out at their joints much of the water from above them, the ground at that point being constantly wet, and the objects for which the drains were laid will entirely be destroyed. It is not material that uniformity of descent be preserved, but although it makes little difference how much the grade changes, it is absolutely necessary that it always changes in the same manner. That is, as you leave the outlet, you must continually go up, though you may ascend at times much faster than at others. Now, the greater the ascent in a given distance, the less danger is there of giving any portion of the drain an inclination in the wrong direction; but if the ascent is small, any mistake of this kind becomes exceedingly difficult to detect. Probably any one could see that an inclination of one in fifty was not a level line, but an inclination of one in five hundred is quite a different thing, and there are few persons that could detect the difference from a level line, or even tell which end was the highest. Great care is necessary to keep a continual descent or ascent, whichever the case may be, and with a less inclination than one in five hundred, the difficulty becomes so great that, except in cases of extreme necessity, it should not be resorted to.

It is thought to be better to have the steepest grades for the drain nearest the outlet, as in that case the water from above would run rapidly off without any deposit of silt. But this consideration very seldom can be taken into account in practice, as the drains must be made to nearly conform to the surface of the ground on the score of economy.

SILT BASIN.

When a grade changes from a greater to a less on the way to the outlet, it is a good plan to build a small well about six inches deeper than the drains, and bricked or stoned up. This well or basin may or may not extend to the top of the ground; the inside diameter may be from 12 to 18 inches. The drain which flows out of this well should have its first tile laid about three inches below those that empty into this well, or, as it is technically called, "silt basin." The object of this is to break the current of water which is flowing through the tile, and thus cause a deposition of all matter, technically called silt, held in suspension in the water. This silt can be cleared out at any time by removing the cover to the top of the basin. The silt basin also affords the advantage of allowing an examination of the workings of the tile at any time, without the trouble or expense of digging up the drain. The silt basin can be profitably put at the junction of two or more drains, and is usually located in such a position only.

THE LOCATION OF DRAINS.

For the economic construction of drains nothing is more important than their location, compared with the land they are expected to drain. Often the choice of a location may make half the difference in the cost of a drain, and time spent in locating a drain should not be counted as lost, for a bad location can never be remedied. No definite rules can be laid down for the location of drains in all cases. Usually the outlet must be at the lowest point in the area to be drained, and from this the main must be laid up the depressions or valleys, and from the main at various points branch drains or laterals are to be laid. That is, the main drains usually follow the lowest portions of the field, and receive the feeders or laterals, which drains make an oblique angle with the main drain, and run from the main drain directly up the slopes to be drained.

This method of running the laterals is now universally conceded to give the best results, though in the early days of drainage, a considerable number of agriculturists advocated and practiced the method of laying their drains obliquely across the slopes. After the drain is constructed, the outlet should be built so as to be a permanent record of the existence of the drain. It is best to build, at right angles to the direction of the drain, a stone wall laid in masonry, and with foundations below the reach of frost. Through this stone wall should pass the last or outlet tile of the drain; this tile should have a diameter one inch greater than the remainder of the drain, so that its end may be grated to keep out vermin, without obstructing the flow of water in the remainder of the drain.

THE SURVEY.

No matter how carefully the drain is constructed, it is liable to be obstructed or injured in some manner so as to make the whole inoperative, for

> "The best laid plans o' mice an' men
> Gang aft agley."

It then becomes necessary to know the exact location of the drain in order to remove the obstruction. This exact location may be preserved in various ways, but whatever method may be used, whether with or without instruments, it will be a method of surveying. If a permanent outlet is made as described, and a silt basin is made which rises above the surface, the whole system of drains may be referred to these two points. I suppose in this instance that all possess means of measuring distance. For instance, if the main drain runs straight from the outlet to the silt basin, the distance alone will be sufficient to thoroughly locate that portion.

If it is not straight, measure a straight course from the outlet to the silt basin, and from that, and as nearly as possible at right angles to it, measure the distance to each bend in the drain. Record these measurements in a book and also the general direction in which they were taken. If any small drain leaves this drain, record the distance from its outlet to the main outlet, and also its general direction and length. The drains beyond the silt basin can be described in the same way, by fixing some kind of permanent monument at the end of each drain, or by giving their general direction and length. When no silt basin is constructed, the direction and lengths of the drains should be stated, remembering that the most explicit direction is not north, south, east, or west, but toward some well-defined permanent point, as the corner of a building, a large tree, etc.

Whenever a drain passes under a fence on the college farm, it is our practice to set a post directly over the drain, and so protected by the fence as to be quite certain of remaining a long time. No directions, however explicit, could cover all cases, but your own ingenuity would doubtless suggest a good method of marking the locations of the drains in any one case, if not exactly, yet sufficiently near for practical purposes. The result of this survey should be fully recorded in a book that is certain to be preserved, and not left to the uncertain record in the tablet of your memory. I feel strongly the importance of preserving such a record of drains, for I have experienced all the uncertainty which results from the want of such a record. I have known quite a sum to be spent in redraining a piece of land, which had already been once drained, and the old drains could, with the expenditure of a few dollars, have been put in a good condition—all because no one knew of their existence, and having an outlet in a different place from the new drains, they were not found until it was cheaper to finish the new than repair the old.

At the College all drains are surveyed with a surveyor's instrument in the following manner: We first pass over the drain with the transit or compass, taking the bearing of every portion of the main drain and laterals. Then, commencing at the outlet, we measure toward the other end of the drain with a chain and set stakes every fifty feet; these stakes are numbered consecutively from the outlet, and are called stations. The station stakes are directly on the center line of the ditch. Two feet to the right of each station stake we set two other stakes, one of which is driven until its head is level with the surface of the ground, the other is made smooth so that its surface can readily be marked and left projecting out of the ground 12 to 15 inches; the first of these last stakes we denominate a "peg," the other is used merely to show the depth that the bottom of the ditch is to be, below the top of the peg.—To be continued.

HAY AND HAY-MAKING.

REPORTED BY A. M. VAN AUKEN.

THE Brown County, Wisconsin, Horticultural and Agricultural Society held its June meeting at the farm of Stephen Burdon, in the town of Howard, on Saturday, June 1st, the subject for discussion being that which heads this article.

The discussion was opened with a paper from Thomas Bennet, who, after a little preliminary skirmishing, said that the question of dollars and cents should cause us to look to the interest of our stock, if we did so for no other reason. It was a losing job to let an animal lose in the winter what it had gained in the summer, and then to have "deacon skins" to bring us pocket-money in the spring; but there was a higher principle, that of humanity to dumb brutes, that should keep us from starving them on poor hay. He cited several cases to show that by giving good feed we would gain one year in the growth of an animal, and that an animal could be kept thrifty on *good* hay and pasture. By way of illustration, he said that he had bought some wood from a man, which was to be good hard wood, but which when delivered, proved to be

red oak which had stood several years after it was dead, and both bark and sap were gone; he refused to take it, as his stove could not hold enough to keep his family warm; and he believed that if our animals could speak, they would most strongly object to this dead hay with which, although it has neither bark nor sap left in it, they are compelled to satisfy their hunger during the winter, owing to the idea which many farmers hold, that hay should get its full growth, which means, that it should stand till its juices are gone and its seed is ripe. The argument that cattle would eat too much hay if it were cut early, was like the economy of men who bought rancid butter.

J. H. Potter, of Pittsfield, spoke next. His paper went into statistics of the average production in Wisconsin of hay and wheat, showing that while wheat took the most labor, yet at each census hay brought the most per acre; that while wheat was all sold off the farm and much of it went abroad, almost all the hay stayed at home, and much of it never left the farm. Hence, while the hay was the most profitable crop to raise, in its actual money value, it was at the same time increasing the fertility of our farms, which the wheat was continually running down. In giving his experience with hay, he said that his farming was on new land, and that he always tried to get a good "burn"; then he dragged well with an A-harrow; sowed his grain, harrowed in, and sowed four quarts of timothy and two pounds of clover to the acre. This makes the best yield of hay, but not the best meadow. After it has been in meadow for some years, he plows it up, gets out all the stumps he can, and plants corn. After corn he manures as well as he can—twenty loads to the acre if he has enough—and plants potatoes. The next spring, he harrows his ground well with a square harrow, and sows his wheat, and with it six quarts of timothy and eight pounds of clover to the acre. His method of curing was much the same as Mr. Campbell's.

Porter Campbell, of Scott, was the author of the next paper. He began by saying that the most natural food for cattle was young and tender grass; that in the pasture they avoided all dead grass; and that the nearer our hay approached to this, the better our stock would like it; he would cut in blossom for timothy, and use the tedder till well dried. Clover he would cut as soon as the heads began to turn brown; use the tedder a little, and cock up; let it cure in the cock several days, and then open out and haul into the barn. Care must be taken not to let it get dry enough to crumble, as clover leaves are the best of the hay. He would cut as soon as the dew was off if there was a heavy dew; if the dew is light, it will do no hurt.

President J. M. Smith now called on those present to discuss the subject, ask questions, etc. Rev. Wm. Crawford, of Green Bay, made a few happy remarks and asked some questions, in reply to which Mr. Campbell said that if you let your grass get ripe, you would have straw and grain; if you cut your rye or oats green, you would have hay; timothy straw was worth more than rye or oat straw, but still it was only straw. The writer said that he understood from their remarks, that Messrs. Potter and Campbell referred to the proper time for cutting hay for market, and asked at what period of its growth it was best to cut clover for feed for milch cows?

S. Burden said: "When half or two-thirds of the heads are turned brown."

Wm. Rowbotham said: "When it has got its growth, I don't care whether a head is brown or not, for after it has its growth, it deteriorates every day it stands." He couldn't agree with Bro. Potter, that we should keep all our farm in hay, but maintained that we should keep only enough in grass and hay to keep our wheat yield up to its best.

Potter said if he had a good market he would prefer to buy his flour and sell nothing but beef and butter. Rowbotham said if all farmers were of Potter's mind and carried his view out, the people would have to "go to grass" or "come to the barn"; bread was the staff of life, and he didn't see what Bro. P. would do with his butter, if we had no bread to spread it on.

President Smith said that he had seen the statement in the principal Minnesota paper a few weeks ago, that no man had ever made a fortune in that State growing wheat. Burden said that in Illinois there was a settlement of Pennsylvania Dutch who had all become wealthy, and he said their money came from wheat.

After the meeting your correspondent moved among the farmers present to get their opinion of Millet and Hungarian grass as a food for stock. One man had sowed five acres of Millet the day before, and would sow five acres more as soon as he had cut his hay, sowing the newly-plowed sod. He could raise double the amount per acre that he could of common hay—timothy and clover—and considered it worth more per ton; it was the best possible food for milch cows. Cut as soon as it begins to turn a little yellow.

No one present had any experience with Orchard grass. Will some reader of the RURAL, who has tried it on a heavy soil, please report?

Miscellaneous

FARM NOTES.

THOROUGH CULTIVATION.

MR. M. B. PRINCE asks whether thorough cultivation is any protection against insects. All insects which infest the soil itself, or which bore the roots of plants beneath the soil, are wonderfully fond of a quiet life; they cannot stand a constant disturbance of their haunts, and will leave for quieter places. On the other hand, vigorous plants of all kinds are produced by very frequent cultivation, and are able to repel insects because they are vigorous. In the same way, a vigorous, healthy animal never becomes lousy or sickly, because it is only weakness which invites the enemy. Therefore frequent cultivation kills two birds with one stone. Mr. P. will, probably, never again apply unrotted manure to his land, unless he wants to perpetuate some pet variety of weed, of which he may accidentally have lost the seed.

He should at once mulch his small fruit-bushes heavily, after a thorough hoeing and loosening of the soil for two feet, at least, around each one.

DEPTH FOR COVERING SEEDS.

MR FOWLER'S remarks on this subject are altogether too local for a journal of extensive circulation like the RURAL NEW-YORKER. We do more harm than good when we undertake to lay down precise rules for a country so vast in extent, so varied in climate, and having such a diversity of soils and conditions of humidity as ours. If the RURAL NEW-YORKER only circulated in Mr. FOWLER'S own immediate neighborhood, or only in localities exactly similar, his rules would be entirely correct; but if the soil was much heavier and wetter, or much lighter and dryer, the depth he advises would be fatal. There must be sufficient covering to exclude light and heat—as opposed to warmth—and to keep the seed in sufficient moisture to induce germination; any more or any less is wrong.

Then, again, explicit rules for a vast extent of country, create mere "clod-hoppers"—men who are mere machines, whose minds are never exercised, who are not forced to think. Thinking, in a correct order, makes a farmer *par excellence*. He should be taught principles, and how to apply them. When writers for the agricultural Press once adopt that plan, their labors will be vastly lessened, and the thinking farmer will not have to wade knee-deep for a fact or an idea.

If Mr. FOWLER'S rules were followed here in Nebraska, we should have no crops.

S. RUFUS MASON.

Dodge Co., Nebraska.

KENTUCKY NOTES.

I REGRET exceedingly that we are compelled to postpone indefinitely our promised "farewell to the potato beetle." But "life is made up of disappointments," and this is one of them. The millions of eggs that we thought the lady-bugs had sucked, or the cool, wet weather had addled, commenced hatching the 2d of June, and, almost before we knew it, our vines were swarming with the ravenous rascals. But a liberal use of Paris-green has so nearly exterminated them that our crop will not be materially injured.

We hear of some fields of wheat in this vicinity being almost destroyed by the midge; but doubtless the reports are exaggerated. The general opinion of farmers in this neighborhood—Hunter's Bottom, which contains nearly a thousand acres of wheat—is that we will have from 10 to 25 per cent. above an average yield. Harvesting will commence just as soon as the weather permits. The Clawson, to my great disappointment, is at least a week later than the Fultz or the English Rough Chaff. But the heads are fine.

We had fine rains on the 8th, 9th and 10th, which were very much needed and have made many a joyous heart but aching back among our tobacco-growers, this being the first "season" they have had since the plants were large enough to "set out."

Apples, peaches, cherries, plums—and blackberries in Trimble Co.—will be in great abundance, cherries being already in excess of demand. We cannot grow Peaches in this Bottom and do not grow Blackberries. But in the adjoining county of Trimble they are both grown to perfection and in immense quantities.

Hog cholera has disappeared, and consequently the talk of State aid in helping us to ascertain the cause, cure or prevention of this great scourge, has ceased, and will not be revived until our herds are again decimated.

S. E. HAMPTON.

Carroll Co., Ky., June 11, 1878.

CROP PROSPECTS, [Circular No. 44]. Consolidation of Reports returned to this Dept Illinois Dept. of Ag. S. D. Fisher, Secretary

THE West Point Centennial Historic Oration, by Major Henry C. Dane. Published by C. W. Carlton & Co., New York. Price twenty-five cents.

ANALYSES AND VALUATION OF FERTILIZERS—Report to the Commissioner of Agriculture on the chemical examination of fertilizers sold in North Carolina during 1877-'8. By Albert R. Ledoux. Chapel Hill, N. C.

NEW ENGLAND CONSERVATORY OF MUSIC, Boston.—This famous music school—the largest institution of its kind in the country—gives no less than 125 hours' instruction at the low price of $15. It employs 75 of the best instructors, and offers superior advantages. It places a thorough musical education within the reach of all.

A SENSIBLE SCHOOL.—Of all our schools, Lasell Seminary, at Auburndale, Mass., seems to be quickest to feel the real needs of education for women. It has a delightful and healthful location. The comforts of its home are remarked by all who visit or attend it. The quality of its instruction is beyond question, and the moderation of its prices brings its great advantages within the reach of all—a rare combination of excellent points.

EARLY in the Spring Mr. E. P. ROE sent us plants of his seedling gooseberries, "Early Ruby" and "Late Emerald." We have now to acknowledge the receipt of fruit from those varieties. There are ten berries of Early Ruby, the average short circumference of which is three inches. They are shaded with purple-red and of an agreeable flavor, neither sweet nor sour. The "Late Emerald" is about the same size, shape and flavor, and of a bright green color. Both are fine fruit, and we hope they may meet the favorable expectations which have been raised respecting them.

WE received a can of "Naiad" Oil from the Rubber Paint Co., N.Y., for trial, and after applying it to the varied purposes for which it was recommended, we found it to be a very serviceable article. It is an excellent water-proofing and leather preservative. We gave our harness, carriage tops, and everything susceptible of being benefited by its use, a coating, and carefully noted if it came up to representations. It has been a satisfactory test. If the price is not too high, it is a good thing to have about the farm. The Company will doubtless be happy to furnish all information.

Everywhere.

GARDEN CITY, LONG ISLAND.

L. A. ROBERTS.

IN times long past—say 150 years ago—many Europeans visiting New York, were taken to see the Plains of Long Island, then a great curiosity. The visitors found a tract of country about 15 miles long and five wide, destitute of trees, and so generally level as to present an unobstructed view. The southern portion, bordering on L. I. Sound, was marshy and covered with rank grass, while, inland, the ground soon became firmer and afforded common pasturage for large herds of cattle. Of this plain 16,000 acres or thereabouts belonged to the town of Hempstead, and, although its extreme distance from New York was but 25 miles, it was allowed to remain uncultivated, and notwithstanding fertile farms and luxuriant gardens were found within its limits, the general verdict was that the plains were barren and not worth cultivating.

About eight years ago, Mr. A. T. STEWART, the merchant prince of New York, conceived the idea of redeeming this barren plain from its ignominious condition and purchased about 10,000 acres of it from the town of Hempstead, a tract extending along the south side of the Long Island rail-road, which is in about the middle of the Island, for four miles with an average width of about two miles. This tract is varied with slight undulations and has a general southern descent of about 20 feet in a mile. Its peculiar situation, in relation to the surrounding country—the sea on the south, and the hills on the north—insures a constant breeze. In the hottest days of summer, with the thermometer in the nineties, the heat does not seem unbearable, while the evenings and nights are cool and comfortable. The surface soil, from 10 to 15 inches in depth, is a dark loam, under which is a layer of yellow loam of about equal thickness. With few exceptions where a clay-loam intervenes, this rests on the gravel-bed which underlies the greater part of the island, and is from 50 to 100 feet in depth. There is not a marsh, pond, or stream, throughout its whole extent, and not a foot of the land that is not susceptible of cultivation.

Near the center of this tract Mr. STEWART determined to establish a town in which persons of moderate means could have homes healthful, beautiful, commodious, and at reasonable rates. Calling to his aid able assistants in all departments, he at once commenced work. Streets wide and spacious were opened and lined with trees; houses sprang up as if by magic; connection by rail was made with New York and the surrounding country, and before the neighbors were aware of it, the wilderness had blossomed and Garden City was a fact.

I have visited the place occasionally since its inception, and watched its progress; but, on a recent visit, after an interval of about two years, I was astonished at the change during that time, and determined to tell the readers of the RURAL what I found.

First, in the central portion of the city is a park of from 25 to 30 acres, beautifully laid out in walks of clean gravel, the borders of which were ornamented with flowering plants and shrubs. Shade trees showing vigorous growth, and the larger-growing evergreens stood further back; and from half a dozen fountains the sparkling water shot up in jets and sprays. The green and well-kept turf gave a deliciously cooling aspect; and, under the rays of the sun, shone bright and clear like emerald. In the distance a flock of fine sheep, under the careful watch of the shepherd, lest they should injure the plants and shrubs, gave a pastoral aspect to the scene. In the rear portion of the park, distant a few rods north of the depot, is a hotel, a four-story structure of brick, built in keeping with the surroundings. This I found to be commodious, clean, complete in its appointments and attendance. Near the depot, in a handsome structure which might be mistaken for a dwelling-house, is the office of the resident manager and superintendent, Mr. W. R. HINSDALE, whose ability, originality, and energy render him indespensable to the prosperity of the enterprise.

The city is divided by streets, eighty feet wide, into squares, which are subdivided into lots varying in area from half an acre to an acre or more. These, when built upon, are separated by open picket fences. The front line of each house is 75 feet from the street. The houses are of various sizes and styles—some of brick; others of wood; and rent at prices varying from $350 to $1000 a year, which sum includes payment for water, gas, removal of ashes and garbage, cleaning streets, etc. The price of rental depends mainly on the size of the house rather than on location or conveniences, as in these respects the man of moderate means fares as well as his richer neighbor. No stables or other out-houses are permitted on the lots. Those having horses are required to keep them in the building erected for the purpose, on the business square, where are also stores, shops, markets, etc., etc. The streets are bordered with trees, of which more than 50,000 have been planted, and with scarcely an exception, all are growing vigorously.

The water supply of the plains is wholly from rainfall, which is about 43 inches a year. Of this but a small proportion goes off by surface drainage, the rest sinks at once into the subsoil, which, as before said, is almost entirely gravel. The well, at Garden City, is in a depression 14 feet below the general surface, is 50 feet in diameter, and about 30 feet deep. The stratum of gravel underlying this was found by boring to be about 40 feet thick. This forms a vast reservoir, free from any mineral or vegetable material that can give impurity to the water, the volume of which is practically inexhaustable. The water enters the well entirely from the bottom, and is supplied to all the houses by Holly pumps, having a capacity to discharge 3,000,000 gallons daily. In purity it excels any other in the county, showing, in a gallon, only 2.7 grains of both organic and inorganic solids.

Notwithstanding the fact that the natural drainage is so complete, not a particle of the sewage is permitted to enter the soil. At present it is discharged into cement tanks and quickly removed, but an extensive and complete system of sewerage has been planned and will soon be completed, in which the whole will be gathered in reservoirs, covered by buildings, deodorized, and every particle used for fertilizing purposes.

Before Mr. STEWART'S death, he had planned to erect a church on the premises, which should be chaste in design and architecture, honest in construction, and free to all. After his death, Mrs. STEWART determined to make this church his monument, under which they both should rest in their last sleep. Under the sanction, and with the approbation of the Bishop and clergy of the Episcopal Diocese of Long Island, she founded a cathedral, now in progress of erection, to be completed within a year, which, with all its appointments and a large endowment, is a free gift to the Diocese. I will not attempt a description of this gem of church architecture. In size it is not equal to many other church edifices, but in beauty of design, completeness and elegance of finish, it will have no superior.

As adjuncts to the Cathedral, schools have been established in which youth of both sexes, will receive instruction from the best of teachers under the direct supervision of the church authorities, and it is probable that this alone will draw to Garden City many families of the most intelligent and refined classes in the country. For here they can have homes with all the advantages of fresh air, pure water, complete drainage—everything that is conducive to health, within about an hour's ride of New York.

But the reader may ask, "Are there not some disadvantages connected with all this, for, certainly, without them, no such place has existe since the Garden of Eden?"

As this article is not, in any respect, intended as a puff or advertisement, but as a plain statement of facts as the writer found them, he will not hesitate to say that—for him—the lack of shade-trees is an objection, one which, however, is being rapidly overcome; the monotony of the level plain that meets the eye on every side, except where, in the distant north, the view is bounded by the blue of the hills, the "backbone" of the island, is not so pleasing as a succession of hill and dale; the newness of everything—streets, houses, fences—seems unnatural, and the absolute neatness of the surroundings does not entirely agree with the habits of the writer. If you take a drive, you go on the same general level for miles, without a rock or a tree for company. The houses are as complete in appointments as they can be made, but it seems as if one must feel under constraint, as if living in a hotel. He can't go into the back-yard and build a pig-pen or a hennery, or muss up things generally as much as he pleases. The regulations won't admit of such things, having constantly in view your neighbors—as if one must consider their likes and dislikes before his own; —and you have the feeling always of a want of ownership. You may lease the premises so long as you pay rent and behave yourself, but never a foot of it can you buy. These are about all the drawbacks I can think of, and now they are written, they don't seem to amount to much, and it is a fair conclusion that there are worse places in which to live than GARDEN CITY.

NORTH CAROLINA NOTES.

REV. A. W. MANGUM.

CHAPEL HILL, N. C., June 26, 1878.

So far we have had an extraordinary summer. Up to the middle of June it was quite seasonable, as to rains; but the temperature has been lower, on the average, than I have ever known it in May and June. At present the sun is hot, but the winds are dry and cool; and signs of drought are appearing around us.

The crop reports are not very encouraging. Wheat suffered from the rust in some parts of the State, and, from that and other causes, has fallen short of expectation. The oat crop, though not a failure, is not a success. In this State oats have nearly always been treated with unfairness. They are seldom sown in any but poor land that is considered unsuited to anything else. Doubtless fewer bushels on fewer and richer acres would be far more remunerative. Where Orchard grass and clover are raised, oats are probably not so much esteemed; at any rate, they are not so much needed. Three crops of hay, during the year, are worth much more than one cutting of oats.

The farmers are much discouraged on account of the destruction of corn by the worms. They cut and destroy it to such an extent that it has been almost impossible, in some cases, to get "a stand." The best prescription that I know for the destruction of the cut-worm, is winter-plowing; but the mild winter in this State probably prevented the usual destruction in that way, there being so few freezes.

The fruit is in plentiful quantity, though the apple crop is very light. One explanatory theory is, that the trees yielded so abundantly last year that they exhausted themselves, and need a year for recuperation. This, I think, depends on the restoration of the fertility. I am almost a believer in the doctrine that a tree ought to bear every year if it escapes the frost or blight. I have a *large* tree that bears *large* apples in *large* quantities, and has borne in great abundance for the three years that I have observed it. I have fertilized it after each crop. Two other trees near it have been treated in the same way, but have not done so well. Their relative situations may explain the difference. I am thankful to the Giver of all good for the prospect for delicious peaches, as they are my favorite fruit. They, too, are in limited quantity, though they will be the better developed in consequence. One of my friends, a fruit-culturist, succeeded this year in ripening a variety of the peach in May. He is not yet certain that it will mature so early regularly.

While speaking of the Peach I will mention a singular species that appears to be a hybrid between the Peach and Nectarine. It grows in a garden in our village, and I am raising some that I got from the garden this year, with the purpose of sending you a specimen or two next season, for the Rural Grounds.

We have a rich harvest of berries which, you know, are quite a profitable article of trade with us; particularly the blackberry.

Gardens have been very successful so far. I have learned, by experience, that in this latitude where the summer is so apt to bring dry seasons, the wisest policy is to plant the earliest seeds liberally. The first crop of almost everything is quite sure to be matured before the dry weather begins. Of course, there should be a succession of certain staple vegetables where it is practicable. There has been some uneasiness about the Colorado beetle in Warren County, N. C. I have not learned, with certainty, that the fears were well-grounded. The beetles were thought to have come in seed potatoes. There was also a "huge" report about the genuine Western grasshopper having been found within a few miles of this place. The statement was made that they were destroying the clover, confining themselves almost exclusively to that; but I failed to get a confirmation of the report in a visit to an adjacent community, and therefore trust that there was some mistake about it.

The peculiar seasons have, to date, been very unfavorable to the cotton. It has suffered much injury. The early rains were helpful to the tobacco-planters, and with suitable seasons hereafter, the crop is likely to be large.

Our State chemist, Dr. LEDOUX, is taking a well-earned rest in the North, perhaps in your city or on the Hudson. He has done a noble and faithful work in testing fertilizers, and enjoys the confidence of all our leading citizens. Of course, he has stirred the ire of some whose articles cannot bear the ordeal of truth and honesty, but he has opened the way for brands that are worthy and will not disappoint.

The second session of our State Normal School is now in operation at this place. It is under the superintendence of Prof. LADD, formerly of Mass., now of the schools of Staunton, Va. He was recommended by Dr. SEARS of the Peabody Fund, who has shown us much liberality, for which we sincerely thank him. This is but one feature of the general movement in favor of more thoroughness and genuine progress in all important interests in the Old North State.

ACROSS CALIFORNIA.

TIME, the tenth day of June; starting point, the city of San Francisco; route, steamer across the bay to Vallejo, thence by rail to Sacramento. The Napa valley is a good farming region, thickly settled, and promising a plentiful harvest. As far as the sight will reach, it is very beautiful, being bounded with low ranges of mountains, which melt into the distant haze, reminding one of Indian summer.

A sharp curve through a canyon carried our train across the divide into the plains of the Sacremento. Thence, about fifty miles through a prairie-looking country, dotted with orchards and grain fields, to the State capital. Around Dixon there are some large pear orchards, containing thousands of trees in bearing. The branches are suffered to head low, for the better protection of the trunks and roots in this hot climate. The plan, here, is a good one, and interferes little with the clean cultivation given. The temptation is sometimes yielded to,—the raising of a crop between the trees,—always with bad results. For it is found that orchards thrive better with frequent and clean cultivation, and without a stolen crop. The fruit is better, and the trees are stronger. So far in our history fire blight has not troubled our pear orchards.

Hundreds of your middle-aged readers, scattered from Maine across the continent, who were familiar with the appearance of Sacramento early in the fifties, would see but little change. The street in front of the Orleans Hotel is raised ten feet higher, where in early times we descended a flight of steps. Nearly across the way is to be seen the modest two-story hardware store of Huntington, Hopkins & Co.

Most of the miners laid in supplies purchased there for the mountains. The same old sign, weather-worn and dim with age, is still above the door, as if in ostentatious humility. This firm of hardware dealers were the famous builders of the Central Pacific railroad, out of which they made colossal fortunes. Hopkins died the other day, leaving to brothers and nephews an estate valued at twenty millions.

In early days the town was a rival of San Francisco. Its proximity to the mines gave great advantages. But with the decay of gold mining, and extended facilities for travel, the rush is passing it by. There is an appearance, a something indescribable, indicating the languor of age. The city, however, will not share the fate of the mining towns. It is slowly prospering in manufactures, and building up a local trade. Away from the sea breeze, we found it uncomfortably warm. The sensation was novel. It was a reminder of old times to see people in linen suits. For, be it known, there is no change of garb the year round in San Francisco. Thick clothes and woolens are necessary in midsummer, and furs are as often worn by ladies in the evenings as at other seasons. There is no great occasion, to be sure, at any time, for wearing them; for there is but little frost. But the sea breeze, on this coast, is searching and cold in the evening. It is the great drawback to our summer climate.

The old sign of the hardware firm reminds me of the history of John P. Jones, in the early days of California. He was engaged, with nine others, at Weaverville, in Trinity County, in 1851, digging a ditch to drain Sidney Flat, for the gold supposed to be hidden there. They all worked hard with pick and shovel; but the enterprise did not "pan out," and was abandoned. In those days the future Senator made little money, and that went with a free hand. He was glad to clerk for a groceryman named Farley, I believe, in the years 1852-3, and sleep under the counter in the store. One night the weight of the snow broke down the roof, and would have crushed him but for the friendly protection of the counter. He was always a student, and would lie on his back reading nights when others were asleep. He was a Justice of the Peace from 1856 to 1858. In the latter year he was a candidate for County Judge, against R. T. Miller, who beat him one vote for the nomination. About 1861 he was the Sheriff of Trinity County. Afterwards he was a State Senator. In 1867 he was a candidate for Lieutenant-governor and defeated. Then he went to the Washoe mines (Nevada), as superintendent of a mine for Alvinza Hayward, at a salary of six hundred dollars a month. Here his star began to ascend. The student who used to lie awake and read of nights in the rough mining camp, entered a broader field. Fortune waited on him and smiled. In the tide of prosperity his abilities became known, and, thenceforth, his life is part of the history of this coast.

Leaving Sacramento by rail, at twenty miles up the American River, we arrive at Folsom. In February, 1856, it was a roaring mining camp, alive with red-shirted adventurers, whose white tents dotted the hill sides overshadowed with pine trees. Its mines are worked out, and hardly a trace of its former prosperity remains. A branch penitentiary is being built there, because the location affords granite. The writer looked in vain for the forest trees. In their stead were prim rows of Australian Gums, hiding weather-beaten rows of old houses.

Resuming our journey towards Placerville, the road began to climb the foot-hills of the Sierra Nevada. As we looked back over a great extent of the plain, yellow with ripening grain, we saw headers at work in the barley. The pastures are turning brown, and great droves of cattle are heading for the snow line, where the grass is plentiful. The snow-covered peaks seem quite near, though seventy-five miles distant, and we begin to look down on hill tops covered with timber. Away to the south, the course of the Cosumnes River can be traced by an irregular boundary of bolder cliffs. From the railway terminus it is a ten-mile stage-ride, via Diamond Springs and Mud Springs, to Placerville. On every hand there are numerous traces of ditches, and flumes, and worked-out mines. These Springs are tumble-down villages of one long street, with rows of cut-stone business houses, mingled with wooden ones, staring at each other across an empty, dusty road. One half of them are untenanted. Others, with imposing fronts and iron shutters, are used for stables and old lumber. Twenty-five years ago these places were hives of industry. A numerous population ebbed and flowed through these mines, and, later, poured along this very highway towards Washoe, like lava from a spent crater. About Placerville there is yet some hydraulic mining. Mountain sides where little more than color could be obtained in early times with the pan, places unworthy of the bold prospector's attention when he could make his ounce or two a day in the gulches, are now sluiced away with vast hydraulic appliances on a scale that pays. A mile from the town the stage crossed a sluice-box about five feet wide and three feet deep, nearly filled with muddy, red water in which gravel and stones are surging past with the speed of a railway train. The fall is tremendous from a bluff where the earth is loosened by streams of water, which wash away through this tail race, as it were. Once in six months there is a "clean up," when the amalgam of quicksilver and gold is carefully taken from the "riffle-bars," of the sluice-boxes.

The traveler looks down on Placerville from the top of a high bluff. There are numerous public buildings and cozy dwellings embowered in orchards and vineyards. It is 2,000 feet above the sea, and, in flush times, boasted a population of 6,000. In early times, Judge LYNCH had occasion to convene his court and hang half a dozen thieves and assassins on a tree by the road-side. These rough and ready men at once christened the camp Hangtown, and to this day it is better known by that name than by the modern one of Placerville. The off-hand manner of dealing with wrongs yet lingers with the inhabitants, and they enjoy the enviable distinction, to-day, of being the only community which ever "got away with" a railroad company.

The story is funny and worth relating. El Dorado County subscribed 200,000 dollars, and Placerville 100,000 dollars, in bonds, to aid the building of a proposed road to the towns. The bonds were delivered in good faith in advance of the work. Then the company sold their franchise, with the unfinished line, to parties who would not complete it. The owners of the bonds wanted their money and brought suit for its payment. On the eve of obtaining a mandamus to compel the local authorities to levy a tax to pay the debt, every one of the country and town officials, liable to be served by the sheriff, resigned. The bond-holders went for relief to the legislature where they received small sympathy; for the El Dorado people succeeded in getting an act passed granting them a board of auditors, with power to transact all sorts of public business except the levying of taxes. This flanked the monopolists, and so the matter stands.

Twenty miles south-eastwardly, on the Cosumnes River, there is a gold mine which we drove out to see, the evening of our arrival. The road leads up and down across ridges and hollows, by abandoned mines and decaying flumes, past lonely farm-houses and orchards, and through stretches of pine woods to the first bend of the river. A quartz mill on the road was thundering away, crushing rocks with a noise like a huge coffee mill. The last six miles of the way ran through an elevated plateau of pine woods, still unsettled and belonging to the Government. Within a mile of the mine we put up with a hospitable ranchman for the night. He grows good wheat, barley, potatoes and fruit, at an elevation of 3,000 feet above the sea, and, when not employed otherwise, is engaged in mining. Leaving our horses next morning we walked to the mine, where we found two Cornishmen lately from Reading, Pa., at breakfast, in a rude shanty made of boards riven from cedar. They were hospitable, intelligent men, and very willingly showed us through the works. The vein was recently discovered, and, so far as prospected, is rich enough; but it is hardly a foot thick. We followed the miners through a long and narrow tunnel, supported here and there by timbers. At the termination we examined the vein or lead, which was inclosed in slate walls. Samples of the ore since assayed at the rate of $211 per ton. The cost of milling and mining is about $12, which would leave a handsome profit with a two-foot ledge.

The surface is covered with a forest; there are no rocks cropping out, or other indications of auriferous deposits. How it happened to be discovered we did not learn, but judged the prospector to be possessed of much faith and a strong imagination. The claim, 600 by 1500 feet, the mill and free water power, were all for sale at $1,600. But there are no good mines for sale. Their owners hold them. It is no longer possible to forage through the mining region and pick up lumps of the virgin metal, as in former days. The reign of enchantment is over. Aladdin and his lamp long ago gave place to the plowshare. As a rule, every dollar of gold mined costs ninety cents in labor. SPECS.

San Francisco, June 24.

LIFE AMONG FARMERS IN NOTRH CAROLINA.

ONE may travel the world over, share the oatmeal porridge of the Scotch Highlander, under the shadow of Ben Nevis; or the Schebzieger cheese of the dwellers by Lake Lucerne; or the barley cake and pickled herring of the Scandinavian, yet he will find no kinder, truer hearts, no friendlier folk, than the plain, unpretending people of the old "Rip Van Winkle," whose simplicity of manner, dress and conversation, reminds one of Diedrich Knickerbocker's New Amsterdamers in the days of "Orloff the Dreamer" and "William the Testy." They are, without exception, hospitable, and one often gets a dainty meal of delicate, wheaten loaves, savory chicken and creamy milk, in an humble log-hut with a worm-fence straggling round it, a pole with a parcel of martin-gourds surmounting it, the sole ornament of the front yard, and in the rear of the dwelling, a rough-looking corn-crib and hen-house.

Somehow or other, these people, on land that looks poor poverty itself, raise nearly all they require for comfortable living—plenty of corn, wheat, rye, oats, buck-wheat, clover, orchard-grass, potatoes, pears and pumpkins.

Their cotton patches, too, by dint of close culture and picking, put considerable money in their pockets, which, along with other home products, enable them to procure "extras." Those poor old sand-hills produce superb peaches, apples, pears, melons and grapes; also strawberries, raspberries and blackberries, besides huckleberries, which grow in the "slashes," on moist, shaded ground along the course of "branches"—the local name for little brooks from springs. These fruits have grown into a source of income of late years, great quantities being shipped, either ripe or dried. I remember eating peaches—"Crawford's Early"—in one of those old orchards the 1st of May--blushing ripe they were; and I have seen no other pears equal to the incomparable Sekel!

The farmers' wives and daughters of the Old North State are women for the times. They keep up the old-fashioned arts of spinning and weaving, and think nothing of turning off eight yards a day. There are a good many cloth factories in the State, and from these the home-weavers buy their warp, spinning their filling at home. This home-woven cloth lasts working men and boys two years. They weave most beautiful counterpanes—such figures as the "snowdrop," "basket" and the "wreath" being commonest, and those are bleached white as snow-drifts, or if woven of wool are colored blue, crimson or orange, as taste suggests. Thrifty, cleanly, industrious and hospitable, it is a pleasure to visit those people, for they give you the heartiest of welcomes, the coziest of white oak chairs, the most tempting of well-cooked dinners, prepared by their own hands.

If you are sick they nurse you patiently and tenderly; they have balms, cordials and tonics of their own make, that will restore you to health

and strength. In the big kitchen-garden are herbs of all kinds; not only sage, fennel, pennyroyal, carraway, and the rest, but stately, Palma Christi, nodding poppies, and tall gold-hearted lilies that yield a healing salve. In the front yard are Monthly Roses of tree-like proportions, Althœas, Privet and "Virgins'-bower." In the long winter nights you hear the spinning-wheel buzzing till eleven o'clock, and the knitting needles clicking in tireless fingers. Before bed-time you are treated to mellow apples, walnuts and hickory-nuts, dry and sweet.

In the glowing firelight you look around the room and see long strings of red pepper, bunches of hyssop and tansy and numerous small bags of seed hanging on the walls. There are the piles of light-wood knots in the corner, the great fire-place filled with burning logs, and you sit up late, enjoying the stories your host tells of his grandfather's days, when the women picked the seed out of the cotton with their fingers, and the happy owner of a bale of cotton hauled it a hundred miles to market, or *trundled* his hogshead of tobacco that far for a buyer—the good old days, when 20 lbs. of sugar and coffee constituted a year's supply, being only used on Sunday.

VIRGINIA DURANT COVINGTON.

RURAL SPECIAL REPORTS.

DALLAS Co., Ala., June 28, 1878.

WE had a very wet spell some time back, but about a week ago it cleared up and the weather is now fine for getting the cotton cleaned out. The prospect never was better for a good crop. We have had fine seasons so far. Corn and cotton look well, and we have had a fine oat crop; some say it was the best ever raised in this county. I grow no cotton; the great drawback here is that they plant too much cotton and not near enough of corn. If the people would raise corn and meat to "do" them, this would be a fine country. They plant more cotton, however, than they can attend to, and have to buy their meat and corn. They say they cannot raise hogs here, but it is a mistake: they can raise anything here that can be raised in the West. There is not so much stealing as there was a few years ago.

JAS. MULLEN.

QUEBEC, July 1st, 1878.

WE have four Pelargoniums from a package of seed sent by the RURAL this spring, and all our seeds did very well. I think Pelargoniums the most satisfactory of plants, and have quite a fancy for them this season; and the children feel the same way. If they have money to spend, they do not say, "I will buy candy," but always: "*I shall buy a plant;*" even little Three-year-old, getting ten cents the other day, handed it to me to buy a plant for her garden.

A. L. J.

SHERMAN, Chautauqua Co., N. Y., July 4.

WEATHER warm, and with frequent showers. Everything growing finely. Grass looking well and with prospects of a good hay crop. Fine warm weather for corn. Potatoes, 60 cents per bushel; butter, 14@16 cents; cheese, 8½@11 cents per pound; eggs, 9 cents per doz. Haying will be commenced immediately. Quail are again heard in this section. Travel to the well-known summer resort, Chautauqua Lake, has commenced.

M. L. DORMAN.

Industrial Societies.

PARISIAN CORRESPONDENCE.

PARIS, June 21st, 1878.

THE French Exhibition is under the special auspices of the Ministry of Agriculture whose chief, M. TEISSERENC DE BORT, has been mentioned, in a former letter, as taking a prominent part in the opening ceremonies. It is but natural therefore that the agricultural interests of the country should be largely represented, and, as a matter of fact, no department of French industry occupies so much space or receives more attention than that which relates to agriculture and allied pursuits.

Of the latter, the department of forestry receives special attention, and in a handsome wooden building devoted to it on the Trocadero side of the Seine, is a fine display of materials and completed utensils made of wood together with a collection of the various tools and appliances used in manufacturing the article. More important still is the exhibit of plans, photographs and models illustrative of the planting and culture of forests, the management of mountain streams, and the reclamation of dunes and sand wastes along the sea-shore. A great part of the fuel used in France consists of charcoal or timber in some form, and both on this account, the general importance of timber for manufacturing purposes, and the destruction as well as destitution caused in past times by sudden floods and prolonged droughts due to the wasteful denudation of timber lands on mountain and plain, great attention is now bestowed on forestry by the Government. Before a tree growing even on a steep mountain side, can be cut down in France, a permit must be obtained from an official of the department of forestry and arrangements in most cases be made to set a younger tree in its place. Nor is it considered enough that trees shall grow where trees have grown before, but constant efforts are being made to win from the mountain, the sea and the desert waste, new space for the cultivation of timber trees.

In this connection, there is a very complete sketch of the drainage effected, several years ago, in the Landes of Gascony. This flat tract of country towards the Spanish frontier, was an arid waste with two feet of sandy soil, beneath which was an impermeable subsoil. Winter rains converted it into a sea of mud; summer heats transformed it into a desert fertile only in fevers. In this land 1375 miles of small canals were constructed, pine trees were liberally planted, and now 460,000 acres of communal lands bear a forest worth, at a low estimate, $16,000,000, while the value of trees on nearly 850,000 acres belonging to private individuals, amounts to about $27,000,000. All this work has been done, too, at the expense of 162 communes, or parishes, without any cost to the Government. Moreover, the land already sold after drainage has netted the proprietors upwards of $1,600,000, half of which has been expended in erecting schools, churches and other public buildings, while the other half has been laid aside as a reserve fund.

Another set of interesting models consists of a pair, showing the aspect of a valley before and after government had taken measures for controlling the water and replanting the denuded mountain sides. One of these models shows the barren, stony gorge, half-choked with boulders and rubbish, the bare base-rock from which fierce torrents have swept the soil, with here and there a ragged tree, clinging solitary to the wind-swept slopes—a scene of ruin and desolation. In the second is seen the same valley, with immense dams of masonry constructed at intervals across it, and between these smaller dams, or steps, made of facines, bedded in stones and banked at both ends with clay. The rock-ribbed hillsides are covered with soil, kept from slipping by rows of stakes, bundles of facines, and low hedges, while on every available yard waves a vigorous young tree. The brook is no longer a capricious torrent, half-dry in summer, and in winter a furious flood, sweeping away the soil and covering the lowlands with gravel and *debris*, but is now a steady stream, pouring a sparkling tide over its many cascades, and bearing health and fertility to the plains below. There are also a number of other models, all representing, not imaginary theories of how such feats might be accomplished, but actual works already successfully completed; and beside these, are hundreds of photographs showing all the details of the works, the camps of the workmen, the young plantations set out in terrace above terrace up the mountain side, the disposal of the facines for retaining the soil until the growth of the trees should hold it permanently, the culverts, and the present genial aspect of the woodland, ornamenting and enriching the mountain side.

It's nearly a week since the close of the great International Cattle Show, held in connection with the Exhibition on the Esplanade of the Invalides, a large open space skirting the Avenue which runs past the splendid retreat of the disabled veterans of France. Here some forty lofty and spacious sheds accommodated the cattle; while sheep, pigs, and poultry were penned in at each end, under rows of umbrageous trees. The number of French exhibitors was 356, while there were in the foreign classes, 145 from Great Britain; 39 from Belgium: 12 from Holland; 12 from Italy; 9 from Switzerland; 2 from Denmark, and 1 from Portugal. Some of these had each on show a large number of animals in several classes. It is a common opinion among Americans that for the highest type of cattle for meat or milk, recourse must be had to British breeds exclusively, but an inspection of the splendid animals here exhibited, might well account for the fact that this opinion is by no means common among those who are nearer neighbors to Great Britain and have ampler opportunities of comparing her stock with those which are esteemed most highly elsewhere. Among the French cattle, the Normans were the most numerous and various in form and color, but all robust, quiet and excellent milk and beef-producers; the Charolaise, however, were by far the most beautiful, with white silky coats, fine heads, large gentle eyes, cylindrical bodies, famous for their fattening qualities, but indifferent milkers. There were also some fine specimens of the Gascon, Garonnaise, Bazadaise, Ponthenaise, Pyrenees, and Breton breeds, each of which is a popular strain in one or another part of sunny France. French Short-horns, lineal and indirect descendants of English Durhams, were likewise largely represented, and bore away a goodly share of prizes. Twelve fine Merinos from the Rambouillet flock, were exhibited by the Government, but did not, of course, compete for prizes. This flock serves as a nursery for French and foreign breeders, the race having been kept pure from its first importation from Spain towards the end of the last century. Within the last fifteen years considerable modification, however, has been made by selection in the fleece, form and capacity for fattening of the animals, on account of the lower price for wool and the higher price for mutton. There were about 250 Merinos also exhibited by private parties, chiefly from the south of France. Among the crosses which the French have made with the Merino, that with the Dishley or New Leicester, seems to be the most successful, eight out of sixteen prizes for cross-breeds having fallen to the lot of this class.

Of British Short-horns, there were 25 entries; of Herefords, only two; one of which, a fine bull from the Queen's herds, took a first prize. There were no entries of Channel Island cattle; only two of Ayrshires; five of polled cattle, including Norfolk and Highland; three of Kerry, and the same number of Longhorns. A very liberal quota of prizes and honorable mentions fell to the lot of the exhibitors of these animals, the Short-horns, of course, bearing off the majority of them. Of English sheep, the best exhibit was Lord Walsingham's South Downs, which won the prize for the best exhibit in the foreign department, besides three first prizes for particular sheep. The Oxford and Hampshire Downs also were well represented, the former bearing off three prizes and the latter one. The Leicesters and Lincolns won two prizes each, while with the Cotswolds Mr. Swanwick of Cirencester, bore away all the prizes, two breeders only having ventured to compete with him.

The Dutch made a very fine display of large—some monstrously large—cattle as elegant in shape as such mountains of flesh could well be, while the cows have a reputation for milk second to none in the show. The Danish cattle also were very fine, one exhibitor, a Danish count, bearing off several prizes. Little Switzerland had fifty head of cattle on exhibition, splendid animals every one of them, mostly from the Cantons of Schwytz and Simmenthal.

The awards of prizes at the poultry show was attended with the caviling, discontent, and hints at unfairness and prejudice apparently inseparable from the bestowal of awards in such competitions. Here the French made not only far away the largest but, it is generally conceded, also the best display. In no country is there made from poultry a tithe of the money which the thrifty and abstemious Gallic peasantry economize from this source. Doubtless more eggs and chickens, even in proportion to your greater population, are eaten in the United States, but more eggs and pullets are exported from France, and bring into the country every year a very large amount of capital. Chicken for breakfast or dinner is by no means an uncommon dish on the poor man's week-a-day table across the Atlantic, but here among the peasantry who own thousands of them, such a repast would be considered an extravagance justifiable only by the occurrence of a wedding or some other memorable *fete*. The French classes were very large. Of Creve-cœurs there were eighty-five cocks and eighty-two lots of hens; of Houdans 80 cocks and 70 lots of hens; of La Fleche 50 entries in each class; of the breeds of La Mans and La Bresse a smaller quantity; and an innumerable swarm of mongrels and provincial types. For table poultry the French breed bones extraordinarily small, and they are strong in the belief that crosses with Asiatics spoil table-fowls. Cochins, Brahmas, Dorkings, Hamburgs, Spanish, Game, Russian, Malays, Polish, and Paduans, all had hosts of admirers, especially the latter, which certainly are truly magnificent fowls. Most of the foreign poultry was English, but despite the fact that the exhibitors have been accustomed to win prizes easily at home, but few fell to their share here; and of the small number of prize-winners one of the most successful was Mr. Belden, of Bingley, whose home was well described by the graphic pen of a RURAL correspondent about a year ago.

THEBER.

PROCEEDINGS OF THE NURSERYMEN'S CONVENTION.

THE proceedings of the Nurserymen's Convention held in Rochester, June 19-21, to which we have already referred several times, were of an unusually interesting character. Mr. MEEHAN thinks that the falling off of the interest in the adornment of the grounds of country homes, is in a measure due to the fact that people of wealth devote more time to summer travel and to visiting places of summer resort than in years gone by, and, in consequence, less time is left for horticultural improvement. Of course, the nursery business suffers accordingly.

During the war and for several years after, the grand rush for country places accessible to New York and other large cities, is fresh in the memory of all. Hundreds of villages sprang up along the lines of rail-roads and bits of land were sold for fabulous prices. All of these new homes were planted with shrubs and trees and the nursery business was flourishing. The tide is now the other way. Many of those new homes are not now worth the sums for which a good share were mortgaged. All out-door embellishments are at an end. Never before in the history of this country was ornamental planting carried on to such an extent as during the period just referred to. Perhaps we might say the same of fruit planting. The depression of business now experienced is felt most where it was most overdone. After a season of rest, and it has already experienced quite a long one, we trust that the interest in the adornment of all country homes, which we are confident is ever on the increase in our new country, will again manifest itself as vigorously as ever and that those nurserymen who in the past have served their patrons most faithfully, will be those to reap a full measure of benefit.

The Vineyard.

GRAFTING GRAPE VINES.

THAT the thing can be done I know, for I have done it myself and employed others to do it, and I doubt not that it can be done successfully, for it is so stated on good authority, but of the latter I have no ocular proof except in the following cases.

In the early days of the Iona and Isabella grapes, I obtained two of each by joining a club and paying ten dollars and express charges. The next season I bought some 50 to 100 for myself and others at a less price, and paid about five and a half dollars express charges on the package which might possibly weigh fifty pounds.

In due time the first four bore fruit of the expected color, and the next season several of the thirty I had planted for myself, fruited, and among the Ionas was one which bore black fruit. So I could not but conclude that through my own carelessness one of the Isabellas had got misplaced. Well, time went on, and the vines grew apace, most especially this misplaced black one, and as I saved cuttings from the most thrifty and propagated for my own use, I soon had quite a row of bearing Isabellas, but they did not fully answer my expectations in flavor. About the year 1874 a neighbor's attention was attracted by the superior vigor of this one misplaced *Isabella* vine, and, on examination, pronounced it a *Concord*, which I was very ready to admit as a fact when I came to examine it. The next season, as I was showing a friend a row of fine Isabellas bearing their first crop, he thought they looked like Concords. Sure enough! their every feature showed it. As to the first four vines, one of the two Isabellas yearly bears a light crop true to name, the other bears a fine crop of Clintons; and of the two Ionas, one bears Concords. Now I do not accuse the seller of these vines of fraud, or even of making mistakes; I think these first four vines bore for a time honest fruit, but as I have been in the habit of training up a new stock from the root when the old one becomes weak, I conclude that is what happened in these cases. The Isabella has ever been with me a feeble affair and in this way do I account for the fact that every vine that I have propagated from what I supposed Isabella parents, has thus far borne Concord grapes. True, I have planted cuttings from true Isabellas, but the sequel shows that they all failed. So I have little faith in my own ability to graft grape vines successfully.

S. B. PECK.

The Garden.

PEA NOTES.

PEAS differ so much in different soils and with different modes of culture, that a good idea of their relative earliness cannot be got from a single experience like that given in "Notes from the Rural Grounds," p. 410. This day, June 29, we have had our first mess from Little Gem, planted April 10. Our earliest pea—the Magog Early, a cross by the writer of Carter's First Crop on Dan O'Rourke, and the product again crossed with Little Gem—planted the same day, is now getting too hard, so that Little Gem forms a perfect succession. The American Wonder, also planted April 10, is not distinguishable, as to maturity, from the Little Gem, wherein it disappoints me. In growth it is more dwarf, and in productiveness not superior; quality not yet tested; but I ask for nothing better than Little Gem. All were planted five inches deep in a moderately light loam; exposure, a slight southerly slope; the peas follow corn, being but lightly manured. The American Wonder very much resembles the Little Gem as I first had it, grown from imported seed. After six or eight generations in Northern Vermont, it has increased in growth of vine, average length of pod, and productiveness, with no loss of quality. One-fourth of the pods carry eight peas. I have a late pea that stands heat well, does not mildew, is a great bearer of long, large pods, the peas of fine quality. Name and origin unknown to me, having received it from a neighbor who got it in the same way, without history.

T. H. HOSKINS, M. D.

Orleans Co., Vt.

The Telegraph Pea is among the most lauded by London horticultural journals. We received seeds of this variety from the Messrs. THORBURN, though rather late to give them a fair trial.

The Querist.

ANSWERS TO CORRESPONDENTS.

Rhinoceros Beetle.

H. C. Smith, Marshall Co., Miss., sends for name and description of a beetle which is to him an entire stranger, and is willing to accept whatever price the specimen may be worth.

ANS.—The insect sent is a male specimen of Dynastes tityus, the gigantic Rhinoceros Beetle of North America. The female of this beetle has not horns like those borne by the male. Its size and form make it recognizable with ease and certainty, but the colors are various, some specimens being dark-brown all over, and others light-green with dark blotches. Sometimes a part of the body is of one color and the rest of another. The beetle is found not rarely in the Southern United States, reaching at least as far north as Pennsylvania and Missouri. It is said to breed in the old stumps of several kinds of trees. Mr. MANN tells us he has found it under heaps of the manure of the Carrion Crow (Cathartes atratus) in the Sea Islands of South Carolina.

The specimen was damaged by having one wing-cover broken, and if sound, it might bring five cents.

Churning Cream.

F. P. Leonard, Noble Co., Minn., is anxious to learn how he can get his churning done quickly and uniformly; of late it has taken an hour, and sometimes two, to bring butter. Accordingly he asks: (1) What should be the temperature of the cream to insure speedy, yet hard butter? (2) Is it uniform temperature that causes butter to come in uniform lengths of time? (3) What makes the cream swell as it does sometimes? (4) What churn is the best to produce good butter in a reasonable time? He is now using a common upright dasher. (5) How quickly would such a good churn make butter? (6) Does it require less labor than the old-style upright dasher? (7) Its price and manufacturers? (8) Is there any chemical substance which, if put into the cream, will hasten the coming of the butter without injuring it? (9) If cows go unsalted, does it prolong the churning of the cream from their milk?

ANSWERS, BY DR. HOSKINS.

(1) This depends somewhat on the season, and on the quantity of cream operated upon at one time. Sixty-two degrees may be called the standard or average temperature, and in large dairies and creameries it need not be much varied for season. But where a few quarts only of cream are churned at once, the temperature should be from five to eight degrees higher in winter, and lower in summer.

(2) Yes, other things being all right.

(3) Churning too warm, generally—always, unless something is the matter with the milk.

(4) The barrel for large dairies, a box-churn for small ones. Jersey cream raised in small pans, is apt to be too thick for any but the dash-churn. Really, the kind of churn is immaterial, except as regards convenience, provided it thoroughly and equally agitates all the cream. The Blanchard is a good churn.

(5) Any good churn will bring the butter in from 15 to 30 minutes if the cream is right. I would recommend inexperienced persons beginning to make butter, to scald their milk before setting. The temperature should be raised to 135 degrees. Be careful about burning. Cream from scalded milk does not usually require over ten or fifteen minutes' churning.

(6) Yes.

(7) See advertising columns, *passim*.

(8) No.

(9) Yes,—at least that is the general belief, though I know of no conclusive experiments on this point.

Raising Onions

M. H. De Ruyter, Madison Co., N. Y., asks: (1) Whether onion seed should be sown in the fall, and what is the best month to do it in? (2) Which is best: the small black seed or onion sets? (3) If a crop is started in the fall, how is it to be protected through the winter. (4) Is fall sowing better than spring?

ANS.—To produce "sets" which are the small bulbs, sow seeds thickly on poor but finely prepared ground in spring, the object of poor soil being to raise "sets" as small as possible and prevent their running to seed. These "sets" are gathered in summer, dried and placed in a loft of the barn or other suitable place. In spring the best, richest soil is prepared and the "sets" which are now to produce onions of the largest size, are planted in drills. If proper care be given to weeding, etc., the earliest of the crop will be fit for market early in June and may all be gathered by the middle of July.

To raise onions from the "black seed," sow as early in spring as the ground can be prepared. The crop will be ready to harvest late in summer. (2) It will appear, therefore, that whether the "black seeds" or "sets" succeed best will depend upon the purposes for which the crop is wanted. (3) On Long Island, N. Y., no protection is given. But a covering of some kind may be needed in your climate. (4) We should prefer spring for sowing the seed. This produces the great onion crop. But if earliness is a first consideration, sow in September—cover the bed after the first hard frost, and uncover in early spring as soon as the frost is out. In this way onions are secured a month or so earlier than by spring planting of seed.

Layering Grape Vines.

J. A. S., Gallatin, Mo., asks what is the proper time and method for propagating Grapes by layering.

ANS.—1. Spring or Fall. Summer shoots may be laid now—but vines from them are not so strong as others. For single vines, make a little trench, six inches deep, and bend the cane into it, securing it by a stone or forked stick. Then cover with earth. The soil should be rich.

Miscellaneous.

M. Knight, living in some one of the nine Hulls in the country, asks for the length, breadth, and probable cost of the "Cheap and Convenient House," a plan of which was given in the RURAL for March 16th.

ANS.—As shown on the plan, the length and breadth vary somewhat, as the house is neither an exact parallelogram nor square; the greatest length, however, is about 51 feet; greatest breadth, about 38 feet; probable cost, in the neighborhood of $2,500. The cost will, of course, depend in part upon the price of labor and materials in the place where the house is to be built; and as these vary somewhat in each of the nine Hulls in which Mr. Knight may live, so far as his note indicates, we can give him no precise information on this point.

E. B. Reynolds, Olmsted Falls, Ohio, says: I would like to know something about artificial egg-hatching. Please let me know where I can find machines used for this purpose, and oblige a reader.

ANS.—Several firms make incubators, each, of course, having some special claim to excellence. We suppose you propose to go into the business, if at all, in a small way, and therefore suggest that you send for circulars to Prof. Corbet of Warren street, N. Y., and Day Bros. & Co., Baltimore, Md., who make good incubators. So far as we have been able to learn, artificial incubation has not proved entirely satisfactory in its results; the most pronounced failure recorded is that of a Mr. Baker, near New York, who has expended upwards of thirty thousand dollars in the unsuccessful attempt to supply our markets with spring chickens whose only mother was an artificial creature. Perhaps the science is not yet in good working order. In any event, it were well to make haste slowly.

C. P., Youngstown, Ohio, says she bought a plant of Eulalia Japonica zebrina, but that there is as yet no variegation of any kind. She asks if the florist ought not to refund the money or supply the variety purchased.

ANS.—Assuredly. We would say, however, that the leaves of this "Zebra-striped" Eulalia do not at first show their transverse stripes. They appear after a while, however, as if the variegated parts were a sort of discoloration.

R. M. Mauzey, Dewitt, Mo., wants to know where he can get a good stump puller.

ANS.—We refer him to the Chamberlain Mfg. Co., Olean, N. Y., who make a very efficient implement.

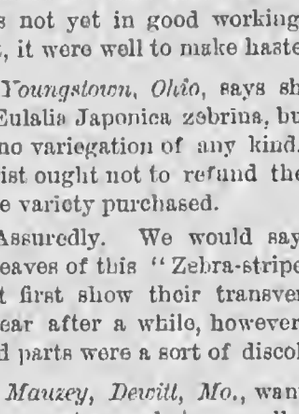
Entomological.

THE HESSIAN FLY.

(CECIDOMYIA DESTRUCTOR.)

PROF. A. J. COOK, of the Michigan State Agricultural College, delivered a lecture upon the Hessian Fly at two Farmers' Institutes, held respectively at Paw-Paw and at Climax, Michigan.



THE FLY MAGNIFIED.

This lecture he has printed in a 14 page pamphlet, 24x16 cm., and offers to send, prepaid by mail, for ten cents, the cost of publishing and mailing. Prof. COOK is well-known to us for his successful endeavors to advance and diffuse the knowledge of agricultural entomology in his own State, and incidentally in other States.

He outlines briefly a portion of the history of this insect since its appearance in the United States at the time of the Revolutionary War, and mentions some of the books in which fuller accounts of it are given; describes it in all its forms; gives an account of its habits; what varieties of wheat it attacks most and least, and how it may be combatted. The following account is drawn mostly from Prof. COOK's pamphlet.

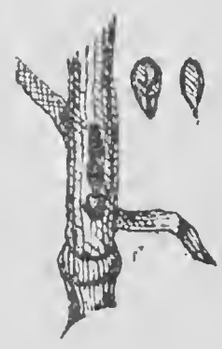
It is a true fly or gnat, having but two wings. The wings are a little longer than the abdomen, are bordered by a fringe of delicate gray-black hairs, and, when at rest, lie flat on the back. They are strengthened by three ribs running lengthwise; the two anterior ribs unbranched, the third rib sending a branch to the inner edge of the wing. The poisers, which grow where hind wings might be looked for, are short and hairy, having a yellow stem and a black head. The legs are long and hairy, with no spines on them. The head bears a half-moon-shaped eye on each side, but has no eyes on its forehead. The antennæ are nearly as long as the body, and are divided into from fourteen to seventeen bead-like "whip" joints, each one of these giving rise to hairs which seem to stand out in a circle round it. The whole length of the fly, from the front of the head to the tip of the abdomen, is three millimeters, and the spread of the wings is six millimeters. The fly is black when its body is nearly empty, except that the base of the wings, the lines of union of the joints, the spaces around the breathing-holes on the sides of the abdomen, the under surface of the body and especially the legs, are more or less marked with very light-yellow. When the female is full of eggs, her abdomen is bright-red, as that is the color of the eggs, which show through the walls of the body. A variable line of the same color may be seen in the abdomen of the male for a brief period before copulation. The entire body in both sexes is covered with short, black hairs.

At the end of the seventh, that is, of the last joint of the abdomen of the female, is a yellow, two-jointed egg-layer, which can be opened or shut like a spy-glass. Instead of this the male has curved forceps or claspers on the end of his abdomen.

The egg is about a half of a millimeter long, and a tenth of a millimeter in diameter, cylindrical, translucent, and of a red color.

The maggot grows to be four mm's long. When first hatched it is reddish; then it becomes pale and clouded with whitish spots, and the food in it shows through the skin as a green line running lengthwise; then its skin turns brown and hardens, and becomes of a bright, chestnut color. Meanwhile the insect shrinks within and away from its skin, which thereafter serves only as a case inclosing the pupa loosely. This case is commonly likened to a flax-seed, from its shape and color, and the insect, when inclosed in it, is said to be in the flax-seed state.

The insects in flax-seed state as they appear under the leaf-sheath of the wheat plant.



THE LARVA OR MAGGOT.

THE PUPA.

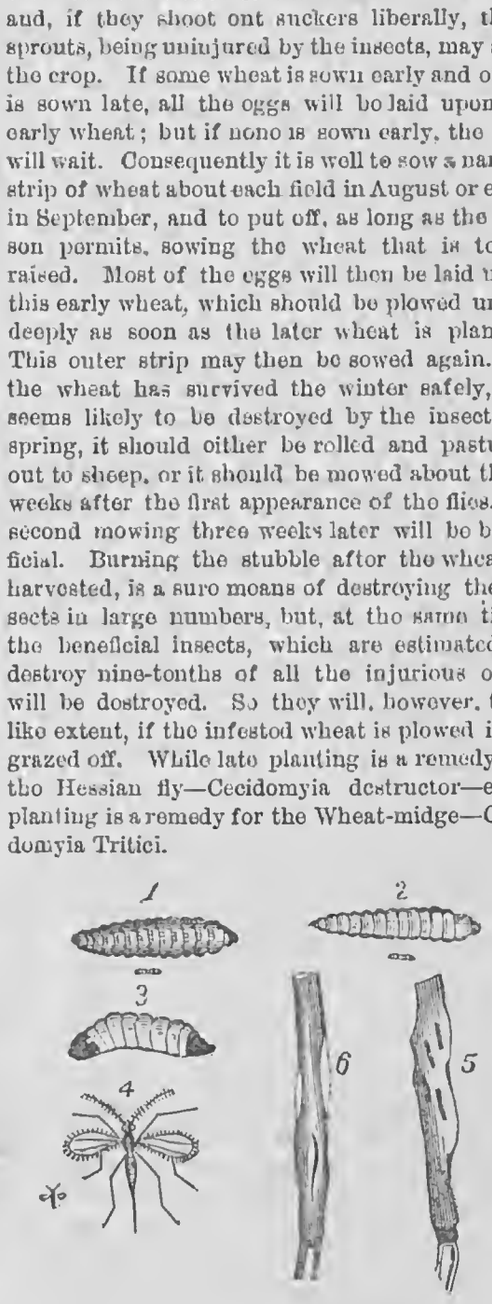
The pupa enclosed in the case resembles a maggot until shortly before the fly is to appear, its internal changes making no outward show for a long time. When the form of the fly appears, it is inclosed in a thin skin, which is shed after the fly has left its case.

HABITS.

The first brood of flies appears between April 10 and the early part of May, and the second brood in July and August, and sometimes a third brood in October. In two to four weeks thereafter, the eggs are laid. The eggs of the spring broood are laid upon spring wheat or barley, rye or grass, if this is sufficiently advanced, but otherwise they are laid upon similar plants of the previous year's seeding. In the former case, they are committed to the lowest leaves, but in the latter case, to the leaves above the first or second joint, rarely to those above the third joint. The eggs of the summer and fall broods are committed to the lowest leaves. They are laid usually on the upper surface of the leaf, sometimes on the under surface, and occasionally on the stalk. Very rarely are more than three eggs committed to one leaf; more frequently only two, and generally only one. The maggots appear in from four to ten days after the eggs are laid, according to the weather, and work down the leaf within the sheath to the base. In about five weeks, the maggot is full-grown, and soon after, it is in the flax-seed condition. By this time the young plant has turned yellow and become bent, or the older plant has become crippled at the swollen joint where the maggot lies.

REMEDIES.

The flies will lay their eggs upon the first suitable plants which they find after they are ready to lay. They injure the Diehl wheat the most severely, then, in successively less ratio, White Amber, Egyptian White Chaff, Lancaster, Lincoln, Gold Medal, Treadwell, Fultz, Clawson and other varieties of red wheat. All varieties which are very vigorous, and which stool largely in autumn, are desirable to plant in autumn; for, if sown late, they will still make a sufficient growth; and, if attacked, they will be more able than other varieties to withstand the damage; and, if they shoot out suckers liberally, these sprouts, being uninjured by the insects, may save the crop. If some wheat is sown early and other is sown late, all the eggs will be laid upon the early wheat; but if none is sown early, the flies will wait. Consequently it is well to sow a narrow strip of wheat about each field in August or early in September, and to put off, as long as the season permits, sowing the wheat that is to be raised. Most of the eggs will then be laid upon this early wheat, which should be plowed under deeply as soon as the later wheat is planted. This outer strip may then be sowed again. If the wheat has survived the winter safely, but seems likely to be destroyed by the insects in spring, it should either be rolled and pastured out to sheep, or it should be mowed about three weeks after the first appearance of the flies. A second mowing three weeks later will be beneficial. Burning the stubble after the wheat is harvested, is a sure means of destroying the insects in large numbers, but, at the same time, the beneficial insects, which are estimated to destroy nine-tenths of all the injurious ones, will be destroyed. So they will, however, to a like extent, if the infested wheat is plowed in or grazed off. While late planting is a remedy for the Hessian fly—Cecidomyia destructor—early planting is a remedy for the Wheat-midge—Cecidomyia Tritici.



THE HESSIAN FLY—VARIOUS STAGES.

Industrial Implements.

AUTOMATIC COW-MILKER.

THE Automatic Cow-Milker is a sterling-silver tube with highly-polished surface, and in all respects a nice piece of work. The tubes are sold in sets of four attached to each other by strips of leather, and seem to be as convenient a contrivance for lessening the labors of the dairy as has been introduced. W. F. ELY, Madison, N. J., is the inventor and proprietor. The following letter from Col. WELD, to whom we sent a set for trial, gives his opinion on the subject:

"I have tried the Automatic Cow-Milker sent me to be tested. If worked well on one cow repeatedly. I have no hesitation in saying that the milker is a valuable article in any dairy establishment, especially for cows with sore or wounded teats, and for milking very short-teated cows, and I think it would be particularly convenient for gentlemen having one or more cows, and liable to be left, now and then, without a person to milk them when changing servants.

"M. C. WELD."

THE AMERICAN FRUIT DRIER.

OUR market reports quote fruit that has been dried by improved processes at a much higher figure than that offered for the ordinary kind. It would appear, then, that fruit so dried must be more acceptable to the buyer, and if this is so, farmers cannot afford to deprive themselves of the increased profit derived from employing the best processes. The American Drier is a new apparatus which has secured the silver medal and approval of the Maryland Institute, for the best fruit evaporator. It is constructed on scientific principles, is simple in application, portable and cheap, and it is claimed that it not only does thorough work but produces fruit that equals that evaporated by the costly large apparatus. Those having fruit should investigate these claims, as it would be greatly to their advantage to produce fine evaporated fruit without being compelled to go to the large expense necessary in most instances. Catalogues, etc., on application to the American Drier Co., Chambersburg, Pa.

The Poultry Yard.

FEEDING YOUNG DUCKLINGS.

GEN. W. H. NOBLE, BRIDGEPORT, CT.

SOME one says, in a recent RURAL, that young ducks should be fed on curds. Pray tell, can nobody raise the quacking pets but those who keep cows, or are close by some great dairy? Why do so many writers about the homestead and the farm, put out just such crude ideas? Why, in face of death from the solid pack of Indian-meal in the stomach of duck or horse, not say that both should be fed on curds? There would be just as much sense in putting the horse on that regimen as the ducklings. Now, when you get at the trouble with fine-ground, raw Indian-meal, it comes to every animal fed on it pure and simple. It not always, but often, packs in the stomach into a hard fermenting mass that kills, unless you loosen its solidity, or in some way rid the inner animal of its load. Much of it, taken alone, just wet up or quite dry, is a pretty sure kill, for duck, hog, or horse. The reason is that its swelling, moisture-absorbing mass does not get softened by the fluids which the glands and stomach secrete, and the stomachic movement works on a solid ball. Warmed by the animal heat and its own fermentation, it cements into a mass that ferments and kills.

There is another reason that comes home closer to the duck. Broad bills were not made, as a rule, to furnish their inside food machinery with dry grist. The duck and all aquatic birds by nature feed on soft, and pretty much on animal food of the softest kind. Now, boiled Indian-meal mush-like, soft and well cooked, never hurt a duck. Grub in the style of spoon victuals, whether of corn or flour cooked or raw, never yet killed one.

As a rule, a duck likes soft food, and loves dearly to muss it over, and search through it for dainty bits with his bill. They should, therefore, be fed in a pan, or a little trough, in which they can fish around and glory in nabbing some morsel about the fit of their gullet. How quickly their bill goes up, and the goody goes down. Then back goes the greedy spoon-bill for another search.

Now, I do not think pure, fine corn-meal, however mixed, uncooked, is best for young ducks. But if given raw, and mixed with fluid, so that when stirred up and tousled over with their bills it's about as thick as gruel, I will pay well for all the ducks it kills, even if they don't have curds. But if you feed them corn-meal raw, by all means have it merely cracked. I think all who raise fowls largely should have a small iron hand-mill, made to regulate the fineness of the meal. It will take but a few moments to grind all needed for the juveniles.

Now, when anybody has a tale to tell through the RURAL, about this or that, let him remember that it is looked to for instruction. Nobody has any business to put forth a rule of work in any line, till he knows the whole wherefor he speaks.

The regimen of young turkies and chickens should follow pretty much the same caution as to fine Indian-meal. Nobody ever knew the young turkey to die much, which a half-wild mother bred up in the woods. She has got some sense about their food, and does'nt find much fine-run Indian-meal to cram them with. Turkeys like curds, too, and eggs mixed therewith and with any meal. But they wont die, if you give soft, cooked Indian-meal alone; nor will cracked Indian-corn kill them, though when quite young, fine meal and potatoes mixed will suit well.

All fowls like variety in food. So, bread, dry, or soaked to be soft and pulpy; or bread and meal and cracked corn together; or potatoes mashed up with all or either, find ready market on their feeding ground. Above all, every fowl loves meat, raw or cooked—raw best. When you live near a city or large town, it's easy to get the butchers' raw bone-scrap. Mash this up with a heavy stone sledge, on a sawed-off block of hard wood, and chop up the mashed mass fine with a hatchet. This is the cheapest food out, if you except scraps. Poultry relish fine-pounded raw bone better. It's egg food and shell material for laying fowls. It may be given quite largely with plenty of other food, though scraps are above all available for those distant from large marts, and can be reached by all. Chop or pound them fine and soak; or soak them and then chop fine; or chop and pound fine and feed dry. Either way will do, as they like the change.

But above all, about young ducks, remember that soft food is their delight. It rejoices their souls to muddle it around after it is in a thick soup-like liquid. "It's their nature to." Boiled potatoes are the one thing that leaveneth the lump to their hearts' content. They live by the sifting and search which they give to the mud-hole and the pool, and the soft food they there find. So give them soft food—meal and bread soaked in a little milk or the water in which meats have been boiled, and the sundries of the swill-tub. Plain stale bread, meal and water mixed with boiled potatoes, will in either state meet with welcome.

Another whim about young ducks is, that they must not be allowed a bath till some weeks old. This is a mistake. It is indeed best, till they get strength and the growth of some weeks, not to let them wander around loose after it, or to tramp with their mother-duck or old hen, through the wet grass. But in the little pen, to which at first they should be confined, a sunken shallow pan or basin, or any reservoir out of which they can readily climb, will be their delight.

Now my hand is in, let me say that the counsel so often given about variety of food for poultry I heartily indorse. But that variety can be had out of different states of the same grain. As a rule, the full kernel best suits their taste, and will do well enough when they have good range in which they can pick the coveted variety, in bugs and grass, and little seeds of weeds, and worms. But the practice of one of our best poultry markets, shows that Indian corn, whole or cracked, or fine meal scalded into mush, or cracked corn boiled into a hominy, or the fine meal merely wet up with water and swollen, will, each on different days or meals, furnish a variety to fatten and delight.

CHICKENS AND EGGS.

THE poultry business, although there is of it only a little here and little there over the whole country, yet when all counted together, is of immense extent. Probably no people, as a nation, consume more poultry and eggs than Americans. Indeed, the quantity of eggs and fowls consumed in our large cities is enormous, amounting every year to millions of dollars in value. The trade in poultry and their product is in fact one of our largest internal commercial interests. I will not here trouble with figures or census returns, for one would then be lost in the vastness of the the business which seems almost incredibly large, but which, nevertheless, is a matter of indubitable reality.

Besides the large numbers of poultry raised for markets, what would an American country home be without its chickens! As soon as the farmer's or laborer's children are old enough to know a chicken when they see it, so soon does their interest begin with regard to their prating, cackling pets, and they soon want to be busy with the little chicks—feeding or protecting them; nor do they think it anything laborious, but take delight in driving away the dog or cat, carrying them scraps from the table, and otherwise making themselves useful. The labor performed in families by young people in this way, if all added together, would, like the value of the stock, prove to be immense. If not done by these, much of it would not be done at all, as men are generally employed at harder work on the farm. Much, indeed, of the great amount of poultry is a clear accumulation of wealth by the farmers' wives and children.

Nothing on a farm brings more pleasure than the poultry when well cared for. Too many look upon poultry-raising as a lottery; they say it's all in *luck*. No, it is management; even the dreaded gapes has no more terrors for those who can extract the vile worm that causes such distressing annoyance; and it is easily done, when one has once seen the operation performed. Where hens have a good run, they cost but little to keep during the summer, and supply many a good morsel. This is so often done, that it is sometimes forgotten or taken as a matter of course; but let the eggs and chickens used for one year in a country home, be taken into account, and one is astonished at the quantity. In summer, when the farmer's wife is too busy to cook fresh, tough meat, she flies to the egg-basket and quickly makes up a good meal with fresh-laid eggs, but often forgets the quantity used in this way. The number of chickens used in some families during a year, is quite large. Our chicken pot-pie is now considered a national dish, and truly it deserves to be so. Either broiled, roasted, or served up in any other way, chickens are toothsome and handy, until the one-year-old fowl makes a good stew or pot-pie. Some prefer a fowl of that age to a young chicken, as the flesh is firmer on the bones and is of a rich, full flavor. Often, too, the farm is situated far from a market, and then a chicken comes very handy to a meat-hungry hard-worked family. In harvesting or busy times, when both horses and men are too tired to go far to market, what is more agreeable than a nicely-cooked chicken!

HENRY HALES

Dairy Husbandry.

HOW TO MAKE THE DAIRY PROFITABLE.

E. W. STEWART.

THE present outlook for dairy products is considered, by the great body of dairymen, as discouraging, and no doubt causes many to desire a change for some other specialty. This uneasiness is often exhibited by some dairymen when dairy products are more remunerative than now. They are wont to change from cows to sheep, from sheep to beef cattle, then back to the dairy again, remaining in one branch only long enough to incur the expense and not to have reached the legitimate profits.

There is not any specialty in agriculture which can be tested properly in two or three years. Experience is a large factor in success in any branch of business. One dairyman will make more clear profit out of his herd with butter at 20 cents than another with butter at 30 cents. The increase of his product per cow from selection and his management in feeding, will add to his neighbor's result more than the 33⅓ per cent. The one will milk his herd, year after year, without learning anything of the individual character of his cows. He does not know which ones pay or which run him in debt. He is one of those who think a cow is a cow, and that all cows average about alike.

A wise dairyman knows that each of his cows has a character of her own, and that that character determines her value in the dairy. He knows that, when dairy products rule strong in the market, it requires a product of 3 000 pounds of milk to pay expenses. If a cow does not exceed that, she pays him no profit and often runs him in debt even for a portion of her food, when the milk is sent to the cheese factory. If the milk is used for butter making, he then knows that 20 lbs. of milk from some cows will make more butter than 30 lbs. from others, and thus it is a question of quality as much as quantity. One cow gives milk yielding very rich, yellow, aromatic cream, another colorless and flavorless cream. The latter animal is seldom worth keeping, even though yielding a large quantity of milk.

Again, a cow is often given a better character than she deserves because she yields a large mess of milk for a short time at the flush, whilst her yield through the season is less than that of another cow that gives only two-thirds as much per day at the best, but holds out her milk two months longer. The value of a cow depends upon her gross proceeds per year, and not upon her yield of milk for two or three months. All these facts must be determined by a test of each cow on her own merits.

Every dairyman should fix a standard, below which no cow should be retained in the permanent herd. This standard should not require the highest production, but rather such average yield as may easily be reached with good feed and care. This standard will then be the yield of the lowest cow in the herd, while the average will be considerably higher. No dairyman, who has studied the question of profit and loss in his business, will fix a standard below 4,000 pounds of milk per year, for this is the minimum yield on which a profit may be made. But he will often be able to reach 6,000 pounds or more, and, with reasonable care in the selection, his average will reach 5,000 pounds per cow for the herd. And if butter be made, the yield should be 200 lbs. per cow, with a herd of common stock. Yielding this average, and if they have been selected for richness of cream, they should yield 250 lbs. of butter per cow. This will form a basis also for 500 lbs. of cheese per cow, and therefore should yield, on an average for any term of years, at least $50 per cow, besides what may be made from the refuse milk in butter making or whey in cheese making. The refuse milk, in butter making, should pay for the labor, leaving the $50 for the keeping, interest on the cost of the cow, and profit. In cheese making the whey is worth less than this for pigs or calves, and would thus reduce the profits somewhat.

The selection of these profitable cows may be made very easily, by simply weighing the milk one day in each week, if cheese alone is to be made; and if butter is to be the product, then in addition to weighing the milk, each cow's milk, for a limited time, must be set by itself, so that the color, quality and quantity of cream may be noted, and the cream must also be churned into butter, as the percentage of cream does not determine the percentage of butter. A cow whose milk requires more than 25 lbs. for a pound of butter should not be kept for butter making, but should be sold for cheese making. Now whilst dairy products are low, the time is most favorable for selecting the herd, and weeding out all cows that do not come up to the standard for which the cows are kept.

Landscape Gardening.

ORNAMENTAL WATER SPOTS IN GARDENS.

WATER in landscape attracts the eye more powerfully than any other surrounding object, and therefore it should never, if avoidable, be placed near a boundary, or near any object to which it is not desirable to attract attention. The margin of pieces of water in garden grounds, when designed to imitate nature, should be as nearly as possible a refined representation of what is seen in natural lakes. The grass sods should never touch the water, as they too frequently do, because the green of the one and the blue of the other do not harmonize. In nature the harmony is provided for by the water sinking lower at one time than it does at others, which naturally leaves a dark line of soil even in the most unfavorable cases, or a narrow line of bright gravel or sand in cases most worthy of refined imitation. As substitutes for gravel, stones may be introduced here and there, being grouped either with plants on the shore, or with aquatics, the shades and reflections of which will produce a degree of variety and effect which will go far towards completing the beauty of the scene. Another rule to be remembered in the placing of water, whether in imitation of nature or in the creation of artificial effects, is that regard should always be had to the surrounding scenery. Water, in imitation of nature, should be placed, like the natural element, in what is in reality or in appearance the lowest portion of the grounds; water in highly artificial scenes is not, however, subject to this rule.

STRAWBERRY BLIGHT.

SPAULDING CO., GA., June 15, 1878.

I SEE in the RURAL for June 15 a communication from Messrs. E & J. C. WILLIAMS concerning Blight in Strawberry plants, a subject which I am anxious to see further discussed through the same valuable medium. I have been experimenting for several years with Strawberries, often paying as high as one dollar and a half for a dozen plants to make a trial, and then throw away after proving them worthless in this soil and climate.

Last year I bought two new varieties, "Monarch of the West" and "Hexamer's Seedling." They were planted in February and grew well, showing on each variety a few berries which were left to ripen, so that their comparative merits might be tested. Early in the season, however, the Hexamer's Seedling began to wither and die out until I nearly lost the stock of them, while the Monarchs continued to grow and spread until the whole bed was covered with runners. Then, when winter came on, they continued to grow and were green all winter, and early in the spring began to bloom, and were first in ripening of seven different varieties. They were very large, many of them measuring five inches in circumference, and of very sweet and delicious flavor, while the Hexamer Seedlings showed but little disposition to grow, and what did grow ripened but few berries—inferior in size, but of good flavor.

About the first of June, I noticed one of the plants of Hexamer wilting and attributed it to heat, as we were then having very hot, dry weather; but since then it has been raining several days, and still my plant did not revive; so when the RURAL came and I read the article on "Strawberry Blight," I went and examined the roots of my plant and found one large grub and two small, dark-brown, long-nosed beetles, all of which seemed to be living on the roots of the plant. I had come to the conclusion that there was a difference in the hardiness of the Strawberry, and that some would not stand our hot summers and others would, and had also concluded that the Wilson Albany and Monarch of the West, both of which have short foot-stalks and broad, thick, green leaves, would stand our climate well and yield remunerative crops, while the "Hexamer's Seedling" and "Agriculturist," both of which have a light-grayish leaf, thin and woolly, with longer petioles, would succumb to our hot, arid climate, and prove to be a poor berry in Georgia. I have had the Agriculturist to die out badly before, but never sought out the cause, and as the question is up, would be glad to hear from some other Strawberry-growers in the Southern States on the subject. I am satisfied that because a Strawberry is good in New Jersey is no evidence that it will prove equally good in Georgia. Climate and soil have something to do with the growth and fruiting of the variety.

J. G. RHEA.

STRAWBERRY NOTES.

WITH us, the strawberry season has just closed. The acreage exceeds that of former years, and the yield has been enormous, beyond all precedent. The main crop sold at four cents per quart. This low price was a great blessing to consumers, while the grower realized about the usual profits, per acre, necessitating, however, much additional labor.

Among the many thousands of quarts literally thrown upon our market, one rarely found any other variety than the familiar "Wilson." Finer-flavored varieties, when offered in market, sold only a trifle higher. Growers of fine-flavored fruits receive very little encouragement from consumers.

A writer in the N. Y. Tribune, charges strawberry growers with desiring only three qualities in the strawberry: that they shall be "big, red, and prolific." If this charge be true, why is it true? I think fruit-growers will find it to their advantage to grow for the public just what the public requires. So long as consumers are unwilling to pay a fair price for a good article, just so long will we raise "big, red, and prolific" strawberries for their consumption. A person can buy plenty of choice fruit, if he is willing to pay a remunerative price for it, but to expect the best, at the cost of the poorest, is unreasonable. People who desire choice fruits, grown at a loss, had better engage in the business themselves instead of writing complaining newspaper articles.

In this vicinity I find these complaining gentlemen will spend their own time, and hinder me, to cheapen their purchases; will travel whole blocks to save one cent per box on berries, and then when they get beat, as they almost invariably do, their indignation is great. Now, Gentlemen, whether correspondents of newspapers or not, you can get the best of every thing by paying a just price, and only in this way. Try it, and if you do not find it so, then please engage in that line yourself, and thus supply what others fail to do.

NELSON RITTER.

THE
RURAL NEW-YORKER.
PUBLISHED EVERY SATURDAY.

Address
RURAL PUBLISHING CO.,
78 Duane Street, New York City.

SATURDAY JULY 13, 1878.

MANY of our old subscribers have written to us requesting that we would sell them the Cricket Clock. Others have complained that the offer (now withdrawn) was of advantage only to new subscribers. In order to satisfy all so far as we are able to do so, we have now the consent of the manufacturers of the clock to offer it to our subscribers—*and to them only*—until the 20th inst. at $1.75 each, delivered to the express office.

A NEW MARKET FOR HORSES.

WITHIN the past year the exportation of horses from this country to Great Britain has acquired very considerable dimensions. With only two fast exceptions, all the lines of steamers leaving this port for the British Isles are accustomed to carry over weekly shipments averaging from forty to seventy animals, while on all the vessels of the two largest lines there are stables especially arranged to accommodate upwards of 100 horses at a time. The prospect of war between England and Russia may, of late, have given a special impetus to this branch of trade; but apart from this, the requirements of business and the comparative scarcity of horses across the Atlantic, render it highly probable that, ere long, this country may become a large source of supply of horses for the British and Continental markets. Leaving war out of the question, England does not breed horses enough to supply her domestic wants; and the increasing use of "tramways" or street cars in the United Kingdom and the Continent, must create a large and growing demand. According to the last census in each country, there are 9,333,000 horses in the United States against 2,762,000 in Great Britain, and the newspaper press of the latter have recently been full of comments on the scarcity and high price of horses. Animals worth from $100 to $150 in the market here, fetch $350 across the water, which certainly leaves a liberal margin of profit above the cost and risk of transhipment. The agricultural returns of Great Britain for 1875 estimate the average selling price of horses in that country at £77, or about $375 per head, whereas the statistics of our Department of Agriculture for 1877, show that horses between five and seven years old, broken to saddle and harness, can, on an average, be purchased where reared in this country—those 15 to 15½ hands high at from $75 to $100, and those 15½ to 16½ hands at from $100 to $125.

In view of the inadequacy of the supply of good, sound horses in Great Britain, therefore, as well as of their comparatively high price, a company has been lately formed there under the patronage of some of the highest names, civil and military, in the kingdom, the title of which—The British Horse Supply Association—sufficiently explains its object. Canada and our Western States, especially Kentucky and Illinois will, at least at the outset, be the principal points where purchases on account of this organization, will be made. The extent the trade has reached in individual hands down to the present time, affords to the new company ample assurances of the success of its undertaking, and renders it highly probable that, within a short time, its agents will be purchasing stock from the practically illimitable supplies to be found in our markets.

In view of the transatlantic outlet for this branch of agricultural industry, which must soon be opened either by the action of this company, by private effort or by both combined, it is of importance to our farmers and breeders to know the kind of horses that will be most in demand for this promising trade. The prospectus of the company and the character of the animals already purchased by the private individuals engaged in the business, show that the horses which will find the readiest demand at the best figures must be large, powerful, well shaped, upstanding animals, with good bone, substance and stamina, such as are suited for every description of work—in a word, good general-purpose horses. Carriage horses, stout saddle horses, and hunters able to carry weight, will also find a good market; but the general-purpose horse, being alike serviceable for home use and profitable for exportation, will be the best animal our farmers can breed.

FARM LINES.

How many of our readers, owning farms outside of the districts surveyed by the Government, have descriptive maps or plots of them by which the boundary lines could be re-established if they should, from any cause, be destroyed? It would seem that a matter so important would not be so often overlooked when the expense of surveying and plotting is so comparatively small.

It does not require the highest degree of engineering skill to measure the courses and distances of farm bounds. Any boy, or girl either, of ordinary intelligence, can learn enough of surveying in three months, by giving to its study one hour each day, to do it correctly. No further knowledge of mathematics is necessary than is taught in any district school. With this and an elementary work on surveying, no teacher is necessary, although as in the case of any other study, a competent instructor is of great assistance.

Of course there will be exceptional cases where the tyro would meet with obstacles to overcome which further knowledge of Trigonometry and Geometry would be necessary, but such will not often occur. An endless number of lawsuits and their attendant expenses have grown out of misunderstandings relative to the proper location of division fences, to say nothing of the family feuds thereby engendered, which have in some cases outlasted several generations, all of which could easily have been avoided. No deed for land should be accepted that does not contain a definite description of the premises purchased. To say it adjoins Smith's land on the north and that of Jones on the east is not sufficient. The limits should be accurately set down by "metes and bounds;" the length of each line and the bearing of each course concisely given. The point of departure, or starting place, should have a permanent monument, and it is well, but not necessary, to place such at some or all of the angles.

To-day a small tree, so small as to be of no value, may be growing on or near a division line of two farms. Fifty years from now that tree alone may be worth as much as an acre of land. The fence has decayed and been reset; if one proprietor chances to be a non-resident, and the other unscrupulous, it would not be very strange if the fence should be on one side of the tree, when by virtue of right it should be on the other. How, without definite record of his bounds, can the rightful owner prove his claim? Cases similar to this are often occurring.

There seems to be prevalent in the community an idea, that if one occupies land and claims it as his for a certain term of years, without molestation, he becomes the legal owner of the same, or in other words, if he can steal his neighbor's land and not be found out until after twenty years, the land becomes legally his. But this is a mistake. The possession and occupation for any number of years do not give title, unless they be accompanied by a claim in some recorded instrument, as a deed, order of court, or the like, and not then if the title be in minor children, insane or imbecile persons.

No honest man has any inclination to take that which does not belong to him, and no rogue should be allowed to do it. To guard against this, have your farm lines surveyed, giving the adjoining owners notice of your intention to do so, that an agreement be made that the lines shall be and remain as run, and have this agreement noted by the surveyor on his minute and signed by the parties in interest.

FROM ANOTHER POINT OF VIEW.

WITH the exception of a frenzied interval, during the riots of last summer, the tramp has confined himself to mild depredations. He has had an eye single to raids on the larder, and his rashness has rarely transgressed the limit of a fierce intimidation of the women of the household after the men were afield.

This moderation, inspired by whatever cause, has, in some quarters, led to a *quasi* sentiment of pity in his behalf, and the country has had an opportunity to read magazine articles fraught with a sympathetic view of the situation, inspired, no doubt, by a philanthrophy that would have done the writers great credit in a more perfect state of society.

The methods in vogue in Delaware for abating the thievish propensities of this nomadic class have been decried, notwithstanding the fact that the existence of the whipping-post has led the tramp to eschew rambles in that State from the wholesome dread inspired by that contrivance for the suppression of crime.

Elated by an increase in numbers, or emboldened by the lenient manner in which he has been dealt with, the tramp now assumes a more threatening front. Late advices from Ohio, report that farmers are commanded to cease from using labor-saving machinery on pain of having their implements destroyed; that notices have been served, warning them that buildings as well as crops would be fired, were not these behests obeyed. Instances are reported of the actual destruction of mowers and reapers, and that timid agriculturists have reverted to the primitive methods of the hand-scythe to secure ripening crops. The braver men have met the crisis with threats of shooting the first tramp that attempts to carry out the programme.

Meanwhile, labor is in demand, at prices ranging as high as one dollar and fifty cents per day, with very little response to the offer. This is a plain demonstration of what has been affirmed, namely, that the cry of "bread or lead" is not sincere. Work is the last thing in the tramp's list of wants, but it is now high time that the subject was taken in hand seriously, and that the fellow be made to feel that law outweighs bluster.

The example set in Ohio, unless checked, will spread rapidly, and not only endanger the harvest, but paralyze one of our most important manufacturing industries. Our laws must, indeed, be impotent, if they are not equal to coping with this new danger. We do not approve of the farmer taking the matter, as he would his revolver, in his own hand. The constable and his posse were created for nothing, if not to crush just such malefactors. The justification is sufficient to warrant the wholesale arrest of tramps wherever found. If this were done, and the prisoners compelled to work for their food under State or county supervision, the active intellects of the leaders would find little appetite for composing threatening notices.

These tramps, who are at present a waste product, could be advantageously employed at repairing roads and similar occupations of a public nature, with the immediate effect of relieving from such irksome duties, those whose time and interests are of more value, thereby decreasing the assessments on property for road and poor-house taxes; for it is patent that the tramp is supported in his idleness indirectly at the expense of property.

Individual and spasmodic effort will be useless in effecting this reform, but it is right here the machinery of the Grange should be powerfully felt. The subject vitally concerns farmers, and if their organization is efficient, they have the means at hand to powerfully influence legislation to that end.

Let the grangers consolidate their efforts, send men to the legislature with matured plans, enact laws that will regulate the abuse, and teach politicians that there are interests more important, and a vote more influential to be secured, than can be obtained by meeting in convention and passing resolutions that are a sop to socialistic and communistic support,—a support which is shown to be, as in the case of the recent elections in California, in the nature of a boomerang, which always returns to plague the party that uses it.

Let there be, then, no more philandering, but prompt, energetic action, and we shall soon have the refreshing sight of the scales of justice weighing out the appropriate punishment for wrong-doing.

THE OUTLOOK.

TRUSTWORTHY reports would seem to assure the harvesting of a fair crop. It is computed that we will garner more than three hundred and fifty million bushels of wheat. About thirty million acres will be wheat, and fifty millions corn. The acreage in cotton, wheat, corn and oats is in excess of last year's. It is noteworthy that the Southern States are devoting a greater area to food crops than formerly, and that New England is increasing her wheat fields.

We shall have, barring accidents, about seventy million bushels of wheat for export, and although the price will probably be lower than it would have been had war been declared, still everything points to a strong foreign demand at remunerative figures.

The States of Pennsylvania, Tennessee, Ohio, Indiana, Michigan, Illinois, Wisconsin, Iowa, Minnesota, Kansas, Missouri and California will produce four-fifths of the entire wheat crop, while Illinois, with her nine million acres of corn, will certainly bear off the palm for the largest acreage in this grain.

Added to last year's magnificent harvest, this splendid exhibit should be most gratifying, and with a balance of trade in our favor, due almost solely to our agricultural products, we may surely look forward to a revival of business, and to bidding a glad farewell to one of the most severe and prolonged crises that has ever convulsed the business interests of this country.

BREVITIES.

THE Columbia College crew has been victorious at the Henley Regatta in England, beating two picked crews from England, and one from Dublin. This is a great achievement in rowing annals. It really begins to look as if there was nothing in which subjects of effete despotisms think they excel, that Americans cannot do better!

THE Woodcock "had he man's reason" would quit the woods and meadows of New Jersey before the Fourth of July. We think, in spite of the terrible heat in the morning and the rain of the afternoon, there is not one left to mourn his companions. The energy and powers of endurance which Fourth-of-July "hunters" display are worthy of a better cause.

Dr. FRANK E. BECKWITH has examined under the microscope the "blighted" strawberry vines of the Messrs. WILLIAMS referred to in this journal a few weeks since. He found in the cells of the fibrils a species of fungus belonging to the genus Perinospora. He thinks that high cultivation may have induced a weakly condition favorable to the development of this fungus. He calls it the "Brown Strawberry Rust."

MR. CLEVELAND thinks there can be no more mistaken and foolish economy than shallow draining which, in his opinion, is simply the abandonment of the chief advantages which can accrue to the soil from drainage. No person whose experience has been sufficient to give weight to his opinion, will admit that a less depth than three feet is worthy of consideration in any case, and in clay soils, or loams having a clay sub-soil, the advantages of a greater depth are so obvious and important, that it may be said—speaking comparatively—that no man can afford to lay his tiles at a less depth than four feet.

NOTES FROM THE RURAL FARM, July 6.—A little rain would be thankfully received by the farmers of the South side of Long Island. Still nothing is suffering. The soil is sandy and the sub-soil gravelly, so that we have never yet known the time that we have had too much rain at this season of the year. We need not designate particular crops when all are as abundant as the care they have received would allow. Those who take occasion to complain merely show that they have not done their part of the work.

Winter wheat is for the most part cut, and spring wheat will be ripe enough in a few days. The field of timothy and clover, referred to a week or so ago, yielded three and a half tons to the acre. Onions, both from potato-onions (multipliers), and from seeds (black), are an important crop in this section of country. The former are ready for market—the latter are looking unusually fine. The abundance of horse-flies and mosquitoes, together with the burning sun of this very hot spell, are trying alike to man and beast. Hoping that the weather may grow a trifle cooler, we are putting off for a day or so the cutting of our six acres of Clawson wheat, which ought, in fact, to have been cut ere this.

A LONG JOURNEY.

JOSEPHINE POLLARD.

"We sail to-day," said the captain gay,
As he stepped on board the boat that lay
So high and dry. "Come, now, be spry;
We'll land at Jerusalem by and by!"

Away they sailed, and each craft they hailed;
While down in the cabin they bailed and bailed;
For the sea was rough, and they had to luff
And tack, till the captain cried out "Enough!"

They stopped at Peru, this jolly crew,
And went to Paris and Timbuctoo;
And after a while they found the Nile,
And watched the sports of the crocodile.

They called on the Shah, and the mighty Czar,
And on all the crowned heads near and far;
Shook hands with the Cid—they really did!
And lunched on top of the pyramid!

To Afric's strand, or northern land,
They steer as the captain gives command;
And fly so fast that the slender mast
Goes quivering, shivering in the blast!

Then on to the ground with a sudden bound,
Leaps Jack—'t was a mercy he wasn't drowned!
The sail is furled, the anchor hurled,
"We've been," cry the children, "all round the world!"

By billows tossed, by tempests crossed,
Yet never a soul on board was lost!
Though the boat be a sieve, I do not grieve,
They sail on the ocean of "Make-believe."

[*St. Nicholas.*

CHRIS' GRADUATION DRESS.

HOWE BENNING.

"They'll be perfectly splendid, of course," said Kate Cox. "Con Livingston is going to wear India mull, with puffs and quillings and lace *ad libitum*, and Fan Ellis is to have pale blue silk; she knows what's good for a blonde, and Isa True, white crape."

"And what is Lou's?" asked Kate's audience.

"Oh, mamma and she are not agreed yet. Lou wants silk and mamma says white is the only proper thing; she was a Holyokite, you know, and the law there was white and blue sashes."

"Somewhat different style, though, I fancy, from the white of to-day, when your mamma graduated."

"Just think of it, girls! Her dress was white Swiss muslin, full round waist, plain skirt and puffed sleeves, and her blue sash—she has it yet—is not as wide as my finger is long. How they must have looked!"

"My mother says it was a great deal more sensible than the present way," remarked Cathie Floss. "I never should dare to graduate now, for fear of being the dowdy of the class. All you hear the seniors talk about is just dress, dress."

"Oh, it's splendid, I think," said another. "Almost as good as one's first ball. I mean to make a sensation when my turn comes, and be got up regardless for once."

"It will be her only hope," whispered Kate; "the sensation never'll come from the inside of her head. But it's stopped raining, girls; let's go." And the merry group scattered down the stairs and homeward.

Meanwhile, in the dressing-room adjoining, Chris sat on the floor listening to the lively chatter with a sudden dread numbing her heart. Her head had been so full of mental philosophy, literature and essays that she had forgotten she was to graduate in a dress, and now—silk and India mull! Poor Chris might as well expect a piece out of the blue sky as either of these. It had been such a happy life to study the dear books and feel that every day was bringing nearer the time when, as a teacher, she could help the patient, hard-working father and mother, and give the little ones a chance in the world. She had known that they were poor and her classmates rich, but that never troubled her sunny nature before. Everybody was good to Chris. Even the haughty Fan Ellis found it convenient to get her help over hard places, and as for Con Livingston, whom Chris worshipped in a girl fashion, hadn't she many a sweet little note and word treasured away of hers? But this dress question! Con in India mull with ruffles and lace was set entirely away.

The little plain home in a poor street was reached at last, and Chris went in to find the busy mother with hands and lap full of mending and foot outstretched for baby to stand by. He crowed and shouted at sight of his sister, and Chris took him up and went to the window.

"Mother," she said, after a while, "what am I going to wear to graduate in?"

The mother sighed. She had thought of that a great deal.

"I don't know, daughter," she said at last. "I did hope to get you a neat white, but times are so hard and father's wages are lowered and you have outgrown everything."

"Yes," said Chris, "what can it be then?"

"I don't see how it can be anything more than a light calico."

"A calico? O mother!"

"Yes, dear, I know."

"But the others have silk and mull and crape."

"Yes, dear, I know, and so does Christ who had not where to lay His head. Think it over in that way. You know, Chris, mother would if she could," and the voice trembled.

"Yes, mother, never mind; it'll be all right, I guess."

But Chris set the baby down and went up to her little room. She did not care much for supper, and the children wondered what made her so still.

When she went up to bed, and Liz and Cora were sound asleep, the poor child sat down by the open window to think it out. But the great tears welled up, and finally the head sank on the window-seat and the aching heart said all the time, "It is very hard, very hard!" and the tears rolled faster and faster.

After a long time, as it seemed to Chris, she heard some one calling very softly, "Chris! Chris!"

She lifted her head; but at first could see nothing, the room was so bright to her dimmed eyes. Then, as she became accustomed to the light, she saw a lovely face smiling upon her.

"Who is it?" asked Chris, wondering.

"I was sent to bring you a dress," replied the visitor, "to wear on your great school-day. It is only a very common one now, but it depends upon yourself to make it as beautiful as you will. Here is a little sprig of a plant called Heartsease that I picked from my Master's garden, and if you wear it with the dress it will be lovely in every eye. Will you keep it?"

And Chris said "Yes," for the fragrance was very sweet; so sweet that she thought she must pin it in her neck and wear it at once. And as she and her mother worked upon the simple dress it seemed to grow more beautiful every day, until the time for wearing it came.

"Why, Chris, how you shine!" said the little ones when she was dressed and kissed them all around.

"O Chris, how splendid!" the girls cried. "Has your uncle come from India or wherever did you find such a love of a dress?" and Con Livingston, in her dainty dress, swept all its grace and laces about her while she gathered Chris in her arms and kissed her again and again, saying, "You are just the sweetest fairy that ever was seen on this platform," until the tears filled Chris' eyes, she was so full of joy, and with a great sob she started up to find herself in the little low chamber with sloping ceiling, the vision and the dress disappeared, and only the memory of the bright dream left. But looking out to the silent moon and the still night, Chris sat and thought, until the perfume of the wonderful plant stole into her soul, and she prayed the loving Master that, however plain the dress she must wear in earthly eyes, in His sight it might be fair indeed.

"When shall I go to look for my bonny calico, mother?" she asked in the morning. "I must begin it soon."

"Do you think you can be satisfied, Chris?"

And such an anxious question as it was. The mother had lain awake too that night.

"Of course I can, mother. It's me, not my dress, people must admire for once."

"Here is the money, then. I have saved it as I could."

Chris thought so when her pocket was weighed down with the nickels. But she realized, too, what the "saving" of her mother had been.

Liz wanted to go, so her sister waited to comb the tangled hair and find the lost hat before starting out, throwing back kisses to Cora and baby.

"I was afraid Chris would be broken-hearted quite," said the mother, fondly; "but I do believe she's the best girl ever a mother had."

And, meanwhile, up in a great block of stores Chris and Liz were turning over the many piles of prints, selecting first one and then another, until fairly bewildered with so many.

"I think I'll have this," said Chris at last, choosing a white ground with a delicate sprig of black.

"O Chris, take this. See, it's almost the same, but it's blue, and so pretty."

"But I like this better, dear."

"Oh, no, this is so lovely."

Now Liz was only a harum-scarum girl of eleven, and the black did seem the prettiest; but Chris thought it did not matter so much as pleasing her sister. So Liz was gratified, the little bundle made up, and they went out.

They were very busy days that followed. The dress got along but slowly, for lessons and baby must have first place of course.

It was almost examination-day, and Chris had stopped one night where she could have the quiet schoolroom to go over the topics of that long Literature that was to be the final recitation of the seniors, when she heard Fan Ellis' voice:

"I do wish some one would go over these topics with me. I never can recite unless I go over them once out loud. Won't some one hear me?"

But the girls all had too much business of their own, and they realized what hearing Fan, the dunce of the class, would be. Chris saw her coming out of the dressing-room with tears on her cheeks. That touched her.

"What is it, Fan? can I help you?" she asked from her corner.

Fan turned. "Is that you, Chris? I want to go over my topics with some one, and the girls are too busy. They have time enough for me when I have a treat."

"I'll hear you, Fan."

"O Chris, that's good! When?"

"Now and here," was the reply.

It was almost dark when the two girls left the school building, and the topics only two-thirds through then.

"We'll finish to-morrow night," said Chris.

"Thank you, Chris: I never studied so hard before, but you see my father is to be here, and he says if I do well he will give me a watch and chain, but if not, I cannot have one for two years."

"I hope you will," said Chris heartily, "and I guess you will, too." But she wondered about her own lesson until she found that helping to fix it in Fan's mind had been better for herself than any amount of study, and so she was fully repaid.

It was the night before the great day, and Chris came home late to find the dress still unfinished. Baby had been sick all day and the mother looked pale and anxious.

"Only one ruffle more for the overskirt, dear," but Chris knew that it was three hours of hard work, and it was already nearly nine o'clock. She went up to her little room a moment and then came back.

"Let me try it all on, mother," she said then; "the children want to see it before they go to bed;" and after all had been duly admired, she said, "There is enough on it now, mother; and we'll hang it up till morning, when I'll come out like a queen, see if I don't."

"But you wanted another ruffle, dear."

"I did—but do not. Tenses change you see, and so must moods. We'll have a good sleep, and baby'll be all right in the morning. So that's all;" and the look of glad relief that came to the tired mother's face was ample reward for the girl's self-denial.

But Chris was not to do all the good work of the world. While she was reading her essay that night to the Professor. Con Livingston called a secret session of Seniors in the dressing-room. "Girls," said Con, "I've found out something splendid to do. Do you know Chris has got to graduate in a calico. Our sewing-girl knows them, and she has seen it. She says it is just as sweet as a calico can be, but Chris felt dreadfully about it at first, of course, then she gave it all up. Now you all know Chris is just as good as she can be and has helped every one of us at some time."

"That's so," said Fan Ellis.

"And she's got a splendid essay," continued Con; "Miss Markham says so; and now let's each one engage one or two friends to throw her bouquets, so she'll be sure to have as many as anybody and be as happy as she deserves; will you agree?"

The girls promised in chorus. "And let's get her a fan," said one, "a pretty plain white one. She'll be so pleased." So that was settled, and the confab broke up and every listening mouse kept the surprise from Chris.

It must be confessed that she made a very pretty picture at home, the trim black-kid boots, the jaunty dress with filmy ruff at the throat and a pale rosebud in place of jewels; but as she came to the great building and saw the crowds of gayly-dressed ladies and elegant gentlemen going up the steps her heart sank a little, and she stole up the back-stairs to the recitation-room where the class were to meet. They were all there when Chris opened the door, glorifying it, the girls thought for a moment with the bright flash and glimmer of the trailing robes.

"Here she is, girls!" exclaimed Connie, catching sight of the figure in the door. "How late you are, but come here, please, we have something sweet to tell you. Come, Fan."

"Please accept this, Chris, from your classmates," said Fan, gently. "We all wanted you to remember us," and the daintily-gloved hand laid the pretty box in Chris' ungloved one, and then they all eagerly watched the little blushing face with smiles and tears chasing over it as she unfolded her gift, and were more than thanked.

Then Con led her into the dressing-room. "I brought a flower on purpose for your golden locks, dear; let me put it in. There, that's lovely!"

"You thought of me?" said Chris, lifting wondering eyes.

"Why, of course, you pet!" and then the dream came true, for the beautiful, dainty Con folded her right into all the delicate finery and kissed her again and again. "You have helped me to be a better girl, Chris, and I thank you for it always."

Then they all went down together and took their seats on the platform, and as one after another came forward to that most dreaded ordeal, reading her essay, and was thanked by thoughtful friends with bouquets and applause, Chris was so happy for each, and over her fan, and Con's kiss, that her speaking face was fairly radiant; and when her name was called, the seventh on the list, she had no thought of fear, but her sweet, clear tones rendered the essay full of feeling. It was a tender, pathetic thing, and many hearts were touched by its simple words, but when it was finished, and Chris turned to go, there was a perfect storm of applause, led by Judge Livingston, and the bouquets came fast and thick. Chris sat down with her lap full in a perfect maze, and every one of her classmates found occasion for the handkerchiefs they had provided only for ornament. And so Chris learned that wearing love in the heart makes fair in all eyes the simplest dress.—*Christian Weekly.*

A LONG JOURNEY.

MANY people are puzzled to understand what the terms "fourpenny," and "sixpenny," and "tenpenny" means as applied to nails. "Fourpenny" means four pounds to the thousand nails, or "sixpenny" six pounds to the thousand, and so on. It is an old English term, and meant at first "tenpound" nails (the thousand being understood); but the old English clipped it to "tenpun," and from that it degenerated until "penny" was substituted for "pounds." So when you ask for fourpenny nails now-a-days you want those of which a thousand will weigh four pounds. When a thousand nails weigh less than one pound, they are called tacks, brads, etc., and are reckoned by ounces.

THE thoroughness of school education in Massachusetts is shown by the recent statistics of the bureau of labor. Only one per cent. of the native farmers of the State are illiterate, while 20 per cent. of the foreign-born inhabitants are so. It is not strange that the illiterate stay in the lower, poorly-paid grades of labor. The moment a man's intellectual faculties are trained he can do something better than saw wood or carry a hod; or, if reduced to common labor, he can do it more neatly and rapidly, so as to secure better pay and more permanent employment.

Literary Miscellany.

THE BACKBITER.

THERE'S some one living in this town,
(Maybe you know her name,
And maybe, should I write it down,
Your own might prove the same.)
Who, when you say, "He's good," will cry,
"Indeed! You think that's true,
But," very confidentially,
"You wouldn't—if you knew!"

One says, "What pretty girl goes by?"
"Oh, horrors! you don't think
So!—Since we're you and I,
I'll say her parents *drink*.
And she,—well, I won't tell it out,
Though I've no doubt 'tis true.
You think she's nice and pretty,—but
You wouldn't, if you knew!"

If one sings sweetly, "How she flats!"
If dressed in taste, "*What* style!"
Supremely "vulgar" all her hats,
Her dresses simply "vile."
And when good Deacon Busby failed,
(A noble man and true,)
She said, when we his lot bewailed,
"You wouldn't,—if you knew!"

Let those admire and love who can
This malice-breathing dame,
Who seems to think a prosperous man
Must surely be to blame,
That beauty is a mark of sin;
That goodness must be crime;
She sees but thieves and rascals in
The heroes of the time.

Sometimes she doesn't hesitate
To tell us what *she* knows,
And in nine cases out of eight
A lie is all she shows.
For virtue's sake, I hope to find
One good old doctrine true.
Some heat for such *I* should not mind,
You wouldn't—if you knew.

[*Springfield Republican.*

"HANG THE BABY!"

ALICE GRAY.

"THEN you won't go, Alice?"

"No, Herbert—I am sorry—but the baby!"

"Oh, hang the baby!" and Herbert flung out of the room, slamming the door behind him.

Alice stood looking at the door, growing whiter and whiter. Then she gave a heart-breaking cry, fell on her knees by the cradle, and hiding her face in her hands, sobbed bitterly.

She had looked forward so long to going to this particular party. It was given by Mrs. Mountjoy, one of the leaders in society, and all who were eminent in politics, diplomacy, or literature, as well as distinguished in the fashionable world, were sure to be there. She had been kept at home so much since baby had been born, that she really felt the need of a little variety and relaxation. But baby had been threatened with croup a week before, and the fond mother had not yet recovered from her fright. Baby, she admitted, was now better, "but not fit," she declared, to be left, at least with only the nurse to look after it. Nurses are so careless, everybody had told her, even the best of them. So she felt it her duty to give up the party. She had not asked Herbert to give it up also, and even said there was no reason he should stay at home; but still, in her heart of all hearts, she hoped he would.

"He said, 'hang the baby;" yes, he did, darling," she murmured, with indignant emphasis, as she bent over the little unsconscious sleeper. "It was your papa who said that, and he has gone to a brilliant party, with such thoughts of his wife and child! Did you come, dearest, to estrange us from each other?"

This awful idea called for bitter sighs.

Herbert had said such beautiful things in her trusting young maidenhood. "Never should their lives run in separate channels, as those of some married people of their acquaintance did"—"never a joy accepted that did not make them one"—"never a barrier should come between them." And now to think that this wee babe, with its golden curls, this beautiful little helpless creature should part them, as never strong hands could!

She pictured the gay assemblage, and her Herbert dancing with fair young girls, smiling on others, and leaving her to die of heart-break.

Her imagination, always too vivid, viewed him in his triumphs, until her misery took almost the form of madness.

"He didn't want me to go," she said; "he acted as if he didn't, and then he pretended to throw all blame on dear, helpless baby."

Suddenly she heard the sound of carriage-wheels outside; they stopped at the door; the bell rung; and a fairy-like figure stood on the threshold of the room, in all the wistfulness of expectancy, with dimpling smiles and laughing eyes.

"Oh, Mabel!" cried Alice starting to her feet with a glad cry. "This is indeed, a surprise. I'm so glad you've come. My darling sister!"

Forthwith ensued a scene of rapturous welcome. Then the baby was exhibited, and one would not have dreamed that a tear had ever stained the cheek of the proud mother. Then the visitor's trunks were ordered to be carried upstairs.

"But where's Herbert? In the study?" said Mabel at last.

All the light went out of her sister's eyes; her hands fell.

"He's out—out, dear."

"Good! Don't be angry, because I'm glad, for we can have such a nice little chat. You didn't expect me."

"Of course I didn't."

"Well, I didn't think of coming, as you know, for a month yet. But I thought it would be so nice to surprise you."

"Oh! I'm so glad."

And then Paul is coming," she said, blushing, "next week, to stay a month; he has business here; and he wanted me so badly to be here too. "I declare," she said, laughing, "I'll have to marry him soon to get rid of him."

"Oh, Mabel! don't marry him unless you're certain you'll be happy!" cried Alice, hysterically. "Be sure, first, he won't go to parties, and le—ave you a—lone with ba—baby," she sobbed.

"What! Is Herbert at a party?" querried Mabel, quite subdued.

"Yes, he is; and when I told him I couldn't go on account of baby, he said, 'hang ba—baby!' Yes, you little angel, your own father sai d those awful words—and then he sl—slammed the door."

"He's a viper!" exclaimed Mabel, with sudden vehemence. "A nice way to treat a wife like you—a baby like that! But why couldn't you leave baby?"

"Because he was threatened with croup last week."

"But he's well enough now—sleeps deliciously. He'll not wake up all the night, perhaps. And the nurse would have taken good care of him."

"I should have been thinking of fire, and all that."

"Oh, nonsense! You ought to have gone. But Herbert had no right to behave as he did; and he must be punished;" and Mabel threw her wraps on the bed, and took her seat by the glowing fire. "It won't do to let him get the upper hand. Ah! I have it. I've thought of a splendid plan. A charming, delightful little plot," and she clapped her hands in glee.

"Oh, Mabel, what is it?" and Alice slid down at her sister's feet, gazing in her face with expectant smiles. "What are you going to do?"

"I'm not going to do it. I shall stay here and watch baby. You are going to the party."

"Mabel! impossible!"

"Quite possible. In fact it must be done. You must let Herbert see that you're as pretty as anybody, and quite as much admired. It is decided. You are to go to the party and play a part. Let me arrange the programme."

"But, Mabel, I haven't a dress prepared—or anything. I gave up going a week ago, you see, when baby was threatened with the croup."

"Pshaw! You shall wear one of mine, one of the most bewitching, bewildering of dresses, bought from my last allowance from Uncle Curtis. Only to see it will throw you into ecstacies. Worth never composed anything more lovely. I want to see it on you. Come, come, call your maid; I am all impatience. We'll shame our bad husband into good behavior, see if we don't. No irresolution, pretty sister, mine. I'll stay at home and fancy myself mistress here, and count your pictures, vases, and pretty things, and catalogue them, so as to make mamma happy with a letter to-morrow. Order John, or Jack, or Will, or whoever your coachman is, to get the carriage—if that's impossible, send for a cab."

In less than an hour Mabel led her sister to the great French mirror, and laughingly introduced her to the loveliest and best-dressed woman she had almost ever seen.

Alice trembled a little when she found herself actually on the way to Mrs. Mountjoy's; but her sister's urgent will had conquered, and her heart was hardened by Herbert's emphatic expression concerning the baby. She was reassured, however, by Mrs. Mountjoy's hearty welcome.

"So glad you've come, my dear," she said. "Your usband said he feared 'baby' would keep you at home; but I told him it was all nonsense. You did right to reconsider the matter."

Herbert, like many handsome society men, was a little spoiled and selfish without knowing it. He loved Alice devotedly; but he was not unwilling to receive the sweet smiles and honeyed words of others; while, with a man's inconsistency, he was not desirous that his wife should play the part of a married belle.

It was while he was dancing with one of the most noted and beautiful women of the metropolis, who was more than willing to listen to his nonsense, that Herbert, looking up from the face leaning against his shoulder, while the dreamy waltz music "thrilled hearts sensitive to sadness as to joy," encountered the sparkling face of his wife, and saw her arrayed in the freshest and most graceful costume in the room. She was moving quietly along with an escort in uniform.

"Pray, don't stumble," said his partner, petulantly, for from that moment the grand repose of his manner was gone, and the lady on his arm might have been made of wax, or any other ductile material, for all he cared now.

"How the dickens came she here?" he muttered to himself, as he led his partner, absently, to a seat, deaf to all her pretty words, blind to her fascinations. "It certainly is Alice—but that dress—the prettiest thing here! and I left her quite determined not to come. I don't understand it. Dancing with that military puppy, Guinnett, too. She knows I hate him."

With these amiable thoughts, he laid himself out to gain the attention of his wife, and make her explain. It was some time before he had the chance, so he was obliged to content himself with following her graceful motions, angry with himself and with her.

"Alice! Can I believe my eyes?" he said, at last, in the pause of the dance.

"I should think you might, rather," was the nonchalant reply.

"Pray, how did you come?"

"Pray, how did you come? I rode. Did you walk?"

"Well, but——"

"Excuse me. I'm engaged four deep already;" and Herbert was forced to move aside, as a pompous acquaintance claimed her hand.

"I'd like to knock that fellow down," he muttered, angry in earnest.

Another pause, and another *tete-a-tete*. No satisfaction given. Herbert had hardly the grace to redeem his dancing engagements.

"About the baby, Alice?" he asked, anxiously.

She put her rosy lips to his ear, and in a subdued voice, exclaimed:

"Hang the baby!"

Herbert started, and changed color. To be sure he had used the same language; but from her it was too exasperating. How he got through the evening he could hardly tell. When, at last, they were together in the carriage, driving home, there might have been an open rupture, but for the determined calmness of Alice, who took everything as a matter of course.

One glance in the beautiful nursery unsealed his eyes. There by the fire, sat Mabel, in all the *abandon* of a *negligé* toilet, her luxuriant tresses falling in glossy freedom over her shoulders, while the little fellow on her lap, clutching at one long, shining curl, crowed and laughed, as well as he could for "auntie's" smothering kisses.

A sudden revulsion of feeling came to the father's heart at sight of this sweet home-picture.

"Aha! I know who contrived this plot," he said. "But I am glad to see you, Mabel, nevertheless."

"Wasn't she the belle of the ball?" answered Mabel, saucily.

"There's no doubt of that. At any rate, I didn't get a chance to dance with her."

"Of course. Who ever heard in society of dancing with one's wife?" she said, sarcastically. "I see that she followed my directions implicitly. You must learn, sir, that a house divided against itself cannot stand—that is, if one half is flirting at a party, and the other half at home crying her eyes out."

"Oh, Alice—were you really?"

"I should think she was. I can assure you that I myself saw half the house dissolved in tears, and so wretched that——"

"Mabel, hush!" said Alice, imploringly.

"Traitor, do you turn on me" exclaimed Mabel, with mock displeasure.

"My child," she went on, tossing the crowing cherub, "tell your selfish papa that he also has *some* obligations, and that if you had known you were to be the bone of contention in this family, you'd have staid in the garden of angels, where you were wanted."

Herbert was strongly affected by this audacious outburst, but it had the effect of leading him to see his duty in a new light. It taught him to reflect; opened his eyes to his selfishness; and made him, from that evening, a better and more considerate husband.

Six months from that time Alice was dressed for a party. But this time the party was given at her own house, and in honor of Mabel's marriage. Even the bride did not look lovelier; for nothing now occurred to mar Alice's happiness; and happiness, after all, is the best preservative of beauty.

"Ah! how charming you look," whispered Mabel, with an aren glance, as they passed each other in the dance. "Prettier, even, and it is saying a great deal, than when I cured your husband, by sending you to Mrs. Mountjoy's party."

A PLAN FOR THE COMMUNISTS.

SUPPOSE the communists take the money they squander in one year and apply it to the realization of communism. Let them send out a committee to Kansas, Nebraska, or Texas, where there are millions of acres as fair and fertile as the sun shines upon, with instructions to pick out and purchase a county adapted to the necessities of communism. They can buy on long time, and will have to make but a very small payment down. As a matter of fact, the money now squandered by them in one year will complete the purchase. Then let them divide their county into townships capable of accommodating two or three hundred families each, and take out their twenty thousand who are hostile to republican institutions and to society on its present basis. The railroads will be glad to transport them for almost nothing, and the avaricious grasping capitalists will be mean enough to furnish them with almost everything they need for their experiment, and the rest of the population will escort them to the depot with a brass band, and throw their old shoes after them for luck. The leaders should be made to give bonds to remain there, and to help in the work and share whatever they may have with the rest, otherwise they may get their dupes out there and then leave them in the lurch.

As for the rank and file, they might be depended upon to do something, as nine-tents of them were brought up at manual labor on the soil. Having located themselves, there need be no delay in launching their experiment, as their wants are very few. As they do not believe in churches, they wouldn't have to spend money for churches, Sunday-school books, Bibles, preachers, pew-rents, choirs, strawberry-festivals, oyster-soirees, or necktie-kettledrums. Not believing in any hereafter, their ideas of immortality would be satisfied with a small patch for a graveyard, and they could all be dumped into one grave, on the true communistic plan. Not desiring to be educated beyond the ability to read and write, graded schools, professors, colleges, text books, laboratories, polytechnics, the languages, globes, lead pencils, india-rubber, Berlin wool, pianos, foot-rules, and other dangerous menaces to the general liberty could be avoided. Having a horror of labor-saving machines, they could make it a capital crime for any communist who should be found with anything more labor-saving on his premises than a spade and hoe, and any person favoring the use of the sewing machine, printing press, telegraph, telephone, steam engine, locomotive, loom, mower and reaper, harvester and binder, fire engine, street car, windmill or water-wheel might be shot on the spot as a malefactor of the deepest dye and a conspirator against the peace and good order of the community.

In this manner the vicious and the virtuous, the strong and the weak, the sick and the healthy, could all settle down together upon a common level, share everything in common, labor for the common good or not labor at all, and have women, children, stock, goods, ground, fire, water, and air in common. They would be out of the reach of poverty, and freed from the grip of the bloated capitalist. No factory chimneys would pollute their pure air. No wheel would vex their running streams. No sound of psalm would disturb their Sabbath mornings. No shrieking engines would traverse their domain. No hum of mower or whirr of shuttle would disturb the drone of the beetle and bee in their broad acres. In a very short time they might solve the problem of maintaining existence without self-effort, self-respect, responsibilities, aspirations, or ambitions, and with no other object of life than food and clothing.—[Chicago Tribune.

HOW TO KEEP A PIANO.

THE piano is constructed almost exclusively of various kinds of woods and metals; cloth, skin, and felt being used in the mechanical portion. For this reason atmospheric changes have a great effect on the quality and durability of the instrument, and it is necessary to protect it from all external influences which might affect the materials of which it is composed. It must be shaded from the sun, kept out of a draught, and, above all, guarded against sudden changes of temperature. This latter is a most frequent cause of the piano getting out of tune, and the instrument should be kept in a temperature not lower than fifty-four degrees and not higher than eighty-six degrees Farhenheit. When too cold, the wood, cloth and skin swell, and the mechanism works badly; when too warm, these materials shrink and cause clinking, squeaking, and other disagreeable sounds. Moisture is the greatest enemy of the piano, and it cannot be too carefully guarded against. In a short time damp will destroy every good point in the instrument.

The tone becomes dull and flat, the wires rusty and easily broken, the joints of the mechanism stiff, and the hammers do not strike with precision, and if these symptoms are not attended to at once, the piano is irretrievably spoilt. Therefore do not put your piano in a damp ground-floor room, or between two windows, or between the door and the window where there is a through draught. Never leave the piano open when not in use, and above all when the room is being cleaned. Do not put it near a stove, chimney, or hot-air pipes. Always wipe the keys after playing. Never pile books, music, or other heavy things on the top. Be careful when using the soft pedal not to thump the notes. Do not allow five-note or other exercises of a small compass on a piano you have any regard for. A leather cover should be kept on the instrument when not in use, and removed every day for the purpose of dusting. A cushion of wadding or a strip of flannel laid on the keys will help to keep them white and preserve the polish. Never leave the piano open after a musical evening or dance. If you are obliged to have it in a damp room, do not place it against the wall, and raise it from the floor by means of insulators, and always cover it after playing. Employ the best tuner you can get, and, if a new instrument, let it be tuned every two months during the first year, and at least three times a year afterward. Always have it tuned after a soiree if the room has been very hot.

AMERICANISMS.

AMONG the best known Americanisms, unused and scarcely understood in England, are locomotive for "engine," railroad for "railway," horse-cars for "tramway," depot for "station," switch for "shunt" baggage for "luggage," store for "shop," bureau for "chest of drawers," clever for "good-natured," boards for "deals," calico for "prints" corn for "maize," dry goods for drapers' articles or "haberdashery," fall for "autumn," dress for "gown," fix for "repair," guess for "think," hardware for "iron-mongery," hold on for "stop," homely for "ugly," loafer for "loungor," mad for "angry," mail for "post," pantaloons for "trowsers," vest for "waistcoat," quite for "very," rooster for "cock," sick for "ill" sleigh for "sledge," stoop for "porch," suspenders for "braces," venison for "deer meat," and woods for "a wood."

MAGAZINES.

ST. NICHOLAS for July opens brightly and seasonably with a story of patriotic interest, by Charles H. Woodman, entitled "The Girl who saved the General."

After this come several lively stories. There is "The Barbecue," by Sarah Winter Kellogg, with a fine picture by Walter Shirlaw. Then comes "Sneeze Dodson's First Independence Day," by Mrs M. H. W. Jaquith, with a laughable picture, and the flavor of July fun is well kept up by the tale of "A Boy's Experience with Tar Marbles" on a very warm day, its three illustrations being by Jessie Curtis.

Besides these attractions there is a story entitled "Too many Birthdays;" and a funny poem, "The Yankee Boys that did'nt number Ten," with ten comical silhouette illustrations by Hopkins.

"How the Weather is Foretold" is clearly explained in an article by Mr. James H. Flint; Professor W.H. Brooks of Johns Hopkins' University, in a liberally illustrated paper, discourses pleasantly about various "Birds and their Families;" and "The Story of Perseus," by Mary A. Robinson, gives a pleasant peep into the wonderland of ancient mythology.

The two serials,—"Dab Kinzer," by William O. Stoddard, and "Under the Lilacs," by Louisa M. Alcott—with striking pictures by Mary Hallock Foote and Sol. Eytinge, have long and exciting installments in this number; and the poems of the issue are "Rain," by Edgar Fawcett;

"Forty, less One," by James Richardson; and "Meadow Talk," by Caroline Leslie,—the last two with capital illustrations. The Departments "For Very Little Folks," "Jack-in-the-pulpit," "Letter-Box," and "Riddle-Box," are varied and attractive.

IN SCRIBNERS' for July is continued the series of illustrated articles on Bird Architecture. A Few Antiques, shows some quaint and curious designs in necklaces, spoons and crosses. An interesting article on The Police of New York has a most ludicrous out "Mustering the Rattle Watch;" nothing could possibly present a greater contrast to our modern police in their fine uniforms than does this primitive-looking "Rattle Watch." Luigi Monti, (whose American Consul Abroad was noticed in these columns a week or two ago), contributes an article on Italy and the Pope, which throws considerable light on the much-discussed question of the "temporal power." "His Inheritance," is concluded and few who have followed the fortunes of Robert Elyot but what will be disappointed that so bright and promising a story should have so commonplace an ending. Frank R. Stockton's "Pomona Takes the Helm at Rudder Grange" is exquisitely funny. We commend its perusal to the suburban resident whose life is made burdensome by lightning-rod men, agents and tramps; more ingenious and efficacious methods of procedure against these very objectionable classes of the community than were employed by Pomona, it would be hard to devise.

THE ECLECTIC for July contains an admirable article on the Eastern Crisis by Goldwin Smith; the second installment of H. Taine's State of Paris before the outbreak of the Revolution, and an instructive paper on Vienna and Viennese Life. Beside these are, a biographical sketch of Edmund Burke; the Greatness of the Romans, by Goldwin Smith; Man and Science, a Reply to Tyndall; The Earth's Place in Nature, besides poetry, domestic and foreign literary notes and science and art. A fine steel engraving, "The Roman Children," adorns the title page.

THE article in LIPPINCOTS for July which will probably excite more interest than any other is Leonard W. Bacon's The Real Prisoner of Chillon: to those who know of this historic personage only through the medium of Byron's poem, Mr. Bacon's article will be a revelation. Margaret B. Wright gives an insight into Parisian student-life in her *An Atelier de Dames*. Chang-How and Anarky by Jennie Woodlile is an amusing account of an attempted fusion of the Celestial and Negro races. The other short stories are, a Bird Story by Wm M. F. Round; Aunt Edith's Foreign Lover by Mary W. Fisher. There is an interesting installment of the serial For Percival. A Levantine Picnic; Popular Marriage Customs in Sicily, by Guiseppo Pitre; Census of 1880, by Henry Stone; The Idyl of the Vaucluse by Charlotte Adams; A Tartar "Fight," by David Ker, and Monthly Gossip and Literature of the Day, complete a most interesting number of this popular magazine.

"SOME War SCENES REVISITED," by T. W. Higginson in Atlantic for July, contains much that will interest those who are curious to learn the effect of freedom on the late slave negroes of the South. The same magazine contains The Will of Peter the Great and the Eastern Question, by Allan B. Magruder, a most interesting and timely article. The first installment of Henry James', Europeans, promises well; Mosumo Sets Yo; or, Womans Sacrifice, by N. T. Kaucko, a Japanese story, is a novelty in magazine literature; St. George's Company, by H. E. Scudder, is an account of the society the eccentric John Ruskin proposes to found. Weak Sight, by H. C. Angell M. D., Americanisms, by R. W. White, besides poems, the Contributors Club and notices of recent literature go to make up a most entertaining number.

THE POPULAR SCIENCE MONTHLY for July, is a notable number. The leading article, by Prof. Du Bois-Raymond, on "Civilization and Science," shows the relations of science and civilization in a new light. He makes a brilliant argument, and is most happy in illustration. Prof. Tyndall tells of "Recent Experiments on Fog Signals," giving a series of interesting experiments, notably the marked results of exploding gun-cotton from rockets in air, as an effectual means of producing powerful sound waves. Mr. Geo. Chahoon has a "Warning for Destroyers of Our Forests." He shows that our water-supply is dependent on keeping our forests intact—especially spruce forests. He makes some original points not heretofore advanced, to our knowledge. Prof. Tenney, in "Seaside Studies," (illustrated), treats of anemones, etc. The question of "Pain in Hanging" is shown to be no question at all. There is no pain, at least Dr. Stacy so maintains. We are glad of it. Mr. R. G. Eccles, plain "Mister," takes up "Radical Fallacy of Materialism," and demonstrates, to our complete satisfaction, that consciousness is not matter, is not energy, is not a combination of these qualities; in short, puts the soul above everything. It is a strongly argued paper. The whole number is very interesting and brimful of popular science.

SUNDAY AFTERNOON, July number, is a very readable volume but not, we think, up to the average level of this exceptionally good magazine. The editor breaks a lance with sundry carping religious papers, and shows pretty clearly that the scope and aim of his journal is certainly as "religious" as anything offered under denominational cloaks. The serials continue, and Rose T. Cooke does a "Funeral Psalm." C. H. Richards asks, "Have we a Christian State?" and C. H. Woodworth has a paper on "The Protestants of Russia." Mr. Gilman enters the arena with, "What is the Use of an Alphabet?" and Olive A. Wadsworth talks about "Little Pilkins." We think an investment in Sunday Afternoon would be a wholesome move, and recommend it.

BRIC-A-BRAC.

GRAMMATICAL SMILES.

A CORRESPONDENT of the New England Journal has collected the following specimens of false syntax:

An Iowa editor thus acknowledges a present of grapes: "We have recieved a basket of grapes from our friend W., for which he will accept our compliments some of which are nearly two inches in diameter."

One of Sir Boyle Roche's invitations to an Irish nobleman was rather equivocal. He writes: "I hope, my Lord, if you ever come within a mile of my house you will stay there all night."

A coroner's verdict reads thus: "The deceased came to his death by excessive drinking, producing apoplexy in the minds of the jury."

A correspondent in writing of a recent convention in the city of Cleveland, says: "The procession was very fine, and nearly two miles long, as was also the report of Dr. Perry, the chaplain."

In the annual report of a town in Massachusetts we find the following: "The town farm-house and alms-house have been carried on the past year to our reasonable satisfaction, especially the alms-house, at which there have been an unusual amount of sickness and three deaths."

A Western paper says: "A child was run over by a wagon three years old, and cross-eyed, with pantalets on, which never spoke afterwards."

A SWARM OF BEES.

B patient, B prayerful, B humble, B mild;
B wise as a Solon, B meek as a child;
B studious, B thoughtful, B loving, B kind;
B sure you make matter subservient to mind;
B cautious, B prudent, B trustful, B true,
B temperate in argument, pleasure and wine,
B careful of conduct, of money, of time,
B cheerful, B grateful, B hopeful, B firm,
B peaceful, benevolent, willing to learn;
B courageous, B gentle, B liberal, B just,
B aspiring, B humble, because thou art dust:
B penitent, circumspect, sound in the faith,
B active, devoted, B faithful till death.
B honest, B holy, transparent and pure:
B dependent, B virtuous, and you'll B secure.

POISONING BY BURNING GAS.

To have our rooms pleasantly illuminated with gas is to undergo a process of poisoning, the more disastrous because, instead of directly producing the characteristic symptoms of defective blood oxygenation, the gas-polluted atmosphere insidiously lowers the tone of vitality, and establishes a condition favorable to disease. It would be difficult to overrate the importance of this household peril. Pictures are spoiled by gas, gilt moldings are tarnished, the colors of decorated walls and ceilings fade, and men and women of delicate organization are enfeebled and injured by the foul air in which gas is discharged and supposed to burn innocuously. The extent to which this evil works in the midst of domesticated families during the long evenings is not adequately appreciated. After the first few unpleasant experiences are over, the physical sensibility becomes inured to the immediate results of breathing an atmosphere charged, more or less heavily, with the products of combustion and unconsumed coal gas. It is not creditable to the ingenuity of practical men that no method has yet been devised by which the advantages of gas as an illuminating agent may be secured without the drawback of slow poisoning, with the host of maladies a depressed vitality is sure to bring in its train.—[London Lancet.

ONE DAY.

Give me joy, give me joy, O my friends,
For once in my life has a day
Passed over my head and out of my sight,
And my soul has naught to unsay.
No querulous word to the fair little child
Who drew me from study to play:
No murmuring word to the beautiful wife,
The angel who walks by my way;
No snappish reply to the hundred and one
Who question me gravely and gay,
No angry retorts to those who misjudge
And desire not a nay, but a yea;
No word to the beggar I fain would take back
No word to the tenant at bay;
No word, though I know I remember them all,
Which I would, if I could, e'er unsay.
Give me joy, give me joy, O my friends,
For the patience that lasted all day!

[*Christian Leader*..

WHISKY DRINKING IN NEW YORK.

A NEW YORK correspondent says: The proprietor of the Metropolitan Hotel told me that his bar receipts were $175 a day. If we suppose the average receipts at the bars to be $20 a day, about $220,000 would have been spent every day for liquor in New York by tippers alone. This is equal to $70,000,000 a year. It is computed that 1,260,000,000 drinks are taken in New York, and a tariff of two cents on spirits and half a cent on ale will aggregate $9,100,000 city revenue. We spend for liquors in the United States $735,000,000 a year, or nearly four times the cost of running the general government; and yet the English exceed us in guzzling by $59,000,000.

TYING her bonnet under her chin,
She tied her roving ringlets in,
But not alone in the silken snare
Did she catch her lovely floating hair;
For, tying her bonnet under her chin,
She tied a young man's heart within.

[*Nora Perry*.

NEARLY ONE THOUSAND YEARS OLD.—Alcohol was invented 950 years ago in Arabia, and was used by ladies with a powder for painting their faces. Since that time it has been used mainly by gentlemen for painting their noses, and used in a plain state because they required no powder to fire them off.

For Women.

CONDUCTED BY MISS FAITH RIPLEY

THE FARMER'S WIFE.

ANNIE L. JACK.

UP in the morning at dawn of day,
Then hardly time to her Maker to pray.
Milking her cows with a "Co, boss, co,"
Under her feet no grass can grow.
Busy, so busy, and this her song—
"The summer is short, and the winter long."
Old in her youth, often weary of life,
Bless her! GOD help her! the farmer's wife.

Chickens to feed, such a hungry crowd,
Calves to be tended of which she is proud.
Bread of the lightest and sweetest to bake,
Butter the golden, and fragrant to make;
Honey, like amber, to strain and to clear,
Fruit to preserve in its season each year,
Cheese to press, and to turn each day,
Bless her! GOD bless her! we sigh, as we say.

Washing and ironing to do each week,
Hundreds of things that a pen cannot speak;
Cook and confectioner, seamstress, is she,
Dairymaid, housemaid, and teacher to be,
Nurse, and physician, and preacher, at home,
City of refuge when erring ones roam.
"She hath done what she could," short her life's little day.
Bless her! GOD help her! my friends let us pray.

MABEL'S HOMILY ON PARLORS.

J. E. M'C.

"WHEN I get a bird and "a nest," said Howard, "I'll have no parlor in it. See what a fuss this room makes for you, cousin Mabel,—twice a year, at least. I'll warrant. There, ma'am, there is the last tack pounded down, and I'm not sorry. When will you have the things hove in?"

"Right away," said Mabel, delightedly; "while I have such excellent help. What a good thing you happened to drive over just as you did; though I will admit you have grumbled amazingly,—for you, I mean cousin Howard. Such an even-tempered, peaceable man as you are, I didn't know anything could bring you down to the commonplace level with the rest of us."

"Much obliged for your good opinion, Mrs. Mac. But seriously, Mabel, what is the use of this room, anyhow, when you have such a cosy sitting-room across the hall? Any one with sense, would ten times rather sit down there and chat and enjoy himself."

"You talk exactly like a man," said Mabel, as if that was saying about all there was to say with regard to incompetency of judgment respecting household affairs. "How would it answer to ask the prim Miss Watson, or the stately Mrs. Bullers into my sitting-room, to find that your namesake had four chairs tied together for a line of cars, and Milly had sprinkled cut papers all over the carpet?"

"First-rate; they would, of course, make allowances, knowing it was your family room."

"You remind me," said Mabel, as she carefully wiped and put in their places some pretty mantel ornaments, "of a celebrated musician who was asked to play on a piano out of tune. He was told that 'the audience would make allowances.' 'Ah! that is what people never do,' he answered. 'Nobody makes allowances, they always expect you to be at your best.' It is twice as true about the housekeeper. Nobody makes any allowance for her, or at least that sort of people is so scarce you would need to go out in the daytime with a lantern to hunt them, as Diogenes hunted for an honest man."

"A cosy little parlor, fresh and pretty, and shut up *and locked up*, if necessary, is a great promoter of peace in the housekeeper's mind. If she is ever so busy and her work is in the most unfinished state, and if the children have been made happy by the freedom of the living-rooms, there is the parlor all 'set aside' ready for any chance caller. There are a good many other luxuries we could give up before that. So don't flatter yourself, young man, that your wife will consent to abolish the parlor, at least until society can be reorganized."

"It is a good thing for the children, too, to have some spot they are obliged to respect, and that it is a special treat to have thrown open to them on birth-days, and at holiday times. I know it does them good and makes them happier and better. Now, sir, what do you say to my homily on parlors,—looks as pink as a rose, doesn't the room?" she added, stepping back to the door, and surveying her work with housewifely pride."

"I say, let's adjourn," said Howard, "and go to the other room, where we can lie off at our ease, and get out the fishing tackle, for I must have some fish yet, for supper, if you have kept me so long over that old parlor."

"I do believe your foot seems on your native heath where you can stir a room up from top to bottom, but you have been such a good, helpful, old cousin this afternoon I'll give you leave. You know where to find John's tackle, but do be careful, Howard, about your fish-hooks. I am about as afraid of them as I would be of a loaded pistol, with that crawling baby about the floor."

A MOTHER'S HEART.

THESE are Mrs. Besant's thoughts about the robbery of her child:

"Sir George Jessel is a Jew; he thinks that a parent should be deprived of a child if he or she withholds from it religious training. Two hundred years ago, Sir George Jessel's children might have been taken from him because he did not bring them up as Christains; Sir Geo. Jessel and his race have been relieved from disabilities, and he now joins the persecuting majority, and deals out to the atheist the same measure dealt to his forefathers by the Christians. The Master of the Rolls pretended that by depriving me of my child he was inflicting no punishment on me. If the Master of the Rolls has any children he must be as hard-hearted in the home as on the bench, if he would not feel that any penalty was inflicted on him if his little ones were torn from him and handed over to a Christian priest, who would teach them to despise him as a Jew and hate him as a denier of Christ. Even now Jews are under many social disabilities, and richly-gilt Christian society looks upon them with thinly-concealed dislike. The old wicked prejudice still survives against them, and it is with shame and with disgust that liberals see a Jew trying to curry favor with Christian society by reviving the obsolete penalties once inflicted on his own people. Of one thing Sir George Jessel and his Christian friends may be sure, that neither prosecution nor penalty will prevent me from teaching both my religious belief and my social doctrine to all who will listen to me, and since Christianity is still so bigoted as to take the child from the mother because of a difference of creed, I will strain every nerve to convert the men and women around me, and more especially the young, to a creed more worthy of humanity.

Sir George Jessel pretended to have the child's interests at heart; in reality he utterly ignored them. I offered to settle £110 a year on the child if she were placed in the charge of some trustworthy and respectable person, but the Master did not even notice the offer. He takes away the child from plenty and comfort, and throws her into comparative poverty; he takes her away from the most tender and watchful care, and places her under the guardianship of a man so reckless of her health, that he chose the moment of her serious illness to ask for her removal; he takes her away from cultured and thoughtful society to place her among half-educated farmers. Nay, he goes further: Dr. Drysdale's affidavit stated that it was absolutely necessary at present that she should have a mother's care; and Sir George Jessel disregards this, and in her still weak state, drags her from her home and from all she cares for and throws her into the hands of strangers. If any serious results follow, Sir George Jessel will be morally, though not legally responsible for them. In her new home she can have no gentle womanly attendance. No Christian lady of high character will risk the misconstruction to which she would be exposed by living alone at Sibsey vicarage with a young clergyman who is neither a bachelor nor a widower. The child will be condemned either to solitary neglect at home, or to the cold strictness of a boarding-school. She is bright, gay, intelligent, merry, now. What will she be at a year's end? My worst wish for Sir George Jessel is that the measure he has meted out to me may, before he dies, be measured out to him or his."

COMMENDED TO MOTHERS,
In the Interests of the Children.

Do you not think that we are apt to underrate the amount of help which the little ones are able to give us? And when the children see that their efforts are appreciated, how willingly they seem and how anxious to do their very best! But we must remember that what may be mole-hills of trouble to us, are mountains of difficulty to the inexperienced, unpractised hands; and we must only give them such tasks as are suitable to their strength and capacity. In a household where the majority of the work devolves upon their mother, how much better it would be if a certain share were allotted to each child, and the little one held responsible for the proper performance of its task.

I have a neighbor, a widow with a large family of children, who seldom hires help, and also finds time for exchanging friendly calls with her neighbors and doing many kind deeds of charity, and yet her house is the perfection of neatness, and her children tastefully dressed. The two oldest, girls of fourteen and twelve, make the beds and put the rooms in order. Charley feeds the chickens and does some weeding, while the youngest, a boy of nine and a girl of seven, wash the breakfast dishes and lay them in the closet. All this time "mother" is free to attend to the calls of the bucther or grocer, gets the churn ready, or kneads the dough into wholesome loaves, and a thousand other things that are the better for being attended to in the early morning.

Before school-time the house is in order, and "mother" is left to wash or iron or sew as it may happen, and the busy B's are off to school as happy as if no such thing as work was known. I must not forget to mention one rule which this wise little woman observed and to which she attributes the readiness with which the children accomplish their tasks. She never encroaches upon the children's hours of play. After school is done they are perfectly free from all care until evening.

This is no fancy sketch, but a veritable, though very poor, description of a family that were my neighbors for years. BUSY BRAINS.

SOME years ago at Port Shieldsborough, Miss., a man held the position of Collector of the Port, and while in office became afflicted with softening of the brain. Under these circumstances his wife performed all the duties of the place for five years faithfully attending to every detail. During three years of the time her husband was bedridden and helpless, but when he at last died and the widow petitioned to be continued in the position, her application was refused, although her application set forth how she had virtually acted as Collector for a long period and had now a family of children dependent on her for support. And although the paper was endorsed by the leading citizens of the place, and by the two Senators from Mississippi, Mr. Boutwell, at that time Secretary of the Interior, returned the petition ungranted, expressing his regret at his inability to comply with it, but stating that the law was explicit—"No one not an elector could hold the position of Collector of a Port."

Domestic Economy.

CONDUCTED BY EMILY MAPLE

SUMMER SIFTINGS.

ANNIE L. JACK.

I DINED in the city lately, and was surprised to hear the lady of the house apologize because they had *ham* for dinner. The half-grown daughter of the house, with all the airs of a full-grown young lady, discussed the question with her mamma, telling her, with the sanitary wisdom that fourteen years of life had taught her, that "ham was not good food, and should not be eaten." While I perfectly agreed with her that too much pork, in hot weather, might not be wholesome, I thought no one could find fault with good, sweet, home-fed, home-cured bacon or ham, if thoroughly and properly cooked. The contrary opinion was lately expressed by a gentleman of the writer's family, who, when suffering from a disturbed state of the stomach, attributed it to "too much *fresh* meat." Moderation in these matters is very necessary in hot weather, and I add to these notes a recipe that forms a choice and dainty dish in summer, much to be preferred to the hot joints so much used.

Presuming that every housekeeper reserves tongues in good pickle for summer use, I suggest that one be soaked over night, and the next day boiled and skimmed. Then dissolve an ounce of gelatine in a quarter of a pint of water, add a little good gravy, and a little burnt sugar for coloring. A pint of boiling water is then added and stirred thoroughly. Cut the tongue into slices and, when the jelly begins to thicken, pour into a large mold a layer of jelly; then one of tongue alternately; and so on till it is all in the mold. When cold, it can be instantly removed by dipping the mold into hot water and inverting quickly. We garnish it with nasturtium flowers and leaves, and find it a tempting dish for breakfast or dinner. Cold meat can often be utilized in the same way, especially mutton or veal, the only difference being that they require the usual seasoning—of which the tongue retains enough after its curing in pickle. These cold and easily-prepared dishes are more appetizing than the usual fry and boil that make the summer dinner hour a terror in many a farmer's hot kitchen.

WASHING.

I HAVE never owned a washing-machine, but I have learned to wash on the same principle and like my new way very much.

It was taught me by a friend who has lived West for many years and, as help there is very poor and hard to get, she has had to rely on her own strength and wits to get through with the wash of a large household. It is as follows: Put all the pieces that are to be boiled in soak the night before, using only clear, cold water, the coarse ones underneath and the finest on top. Put the boiler on early in the morning, about three-quarters full of water, and shred about two inches of a bar of soap in the water. Meanwhile wring out all the fine clothes and, laying them on the table one by one, rub the soiled parts with soap, and when the water in the boiler comes to a hard boil, put them in, a few at a time. Do not fill the boiler too full, as the water must wash through the clothes to extract the dirt. Let them boil from twenty minutes to half an hour, not more. While these are boiling, you can be preparing the coarser pieces in the same way as the first. Take out the fine pieces into a tub and put in the other clothes, adding water if necessary and a little more soap. You now begin to see the advantage of the new system; for when you begin to rub the clothes, you find that they need very little rubbing, indeed the napkins and tablecloths seldom need any. Rinse the same as usual, and I, for one, will be surprised if you do not own how much less labor your washing has cost than in the days of old. MAY DAY.

QUERIES ANSWERED.

Recipe for Soap.

-PLEASE give recipe for a good hard soap, and oblige, RURAL READER.

Ohio.

ANS.—Concentrate lye by boiling until a medium-sized potato will not sink below the surface. Fill an iron kettle two-thirds full of this lye; add melted fat—the firmer sorts of fat like that obtained from cattle or sheep are best—a ladleful at a time, stirring constantly until the mass becomes creamy; then add salt in small quantities at a time; boil gently until it thickens and becomes ropy, or until a perfect ring can be made on the surface with a stick; let the fire go out and the soap will rise to the surface and harden as it cools. The lye may be drawn off by tilting the kettle, or the soap may be lifted off and laid out to dry until hard enough to cut into bars. Resin is sometimes used to make it harder, and one pound and a half to six pounds of grease, form good proportions. When it is added, dissolve it in the melted fat before adding it to the lye.

Another good domestic soap is made as follows: Dissolve six pounds of washing soda in four gallons of warm water; slack six pounds of fresh quicklime in a tub, using only enough water to crumble it nicely; then add to the dissolved soda; stir well together and add about four gallons of boiling water; let settle and pour off the clear lye into a clean iron kettle; stir constantly and add, little by little, twelve pounds of clarified grease; dust in four ounces of powdered borax, and boil fifteen minutes or until it thickens. Line a tub with a piece of cloth, letting the ends hang over to allow of the soap being lifted out when cool; pour in the soap and let it stand a few days, when it may be turned out and cut into bars with a thin wire.

Ammonia.

Is liquid ammonia used in making cake, if so, is it injurious? Please give a recipe in which it is used, giving the quantity?

MRS. MARTHA HINDS.

ANS.—We have never tried *liquid* ammonia in cake, neither do we know of its being used. Baker's, or salts of ammonia is, however, used, and we do not believe it injurious when used as directed. The following proportions for cookies—we have not a recipe for cake—will be found good: one pound of sugar; one pint sour cream; one ounce of salts of hartshorn; a little salt and nutmeg to taste; add flour sufficient to roll. The hartshorn must be pulverized and dissolved in the cream.

Regilding Mirrors, etc.

(1.) Please give directions for regilding mirror or picture frames? (2.) A recipe for coloring a light Japanese silk dress brown.

RURAL SUBSCRIBER.

ANS.—(1.) Implements for gilding are: A gilder's cushion, which is an oblong piece of wood stuffed with several thicknesses of flannel, and covered with rough calf-skin with a border of parchment, about four inches deep, at one end to prevent the air blowing the gold leaves about when on the cushion; a gilding knife; several camel's-hair pencils of assorted sizes, and a burnisher. Turn the gold leaves out of the book, one at a time, on to the cushion, and with the gilding-knife cut it into the size required; place the frame in nearly a horizontal position and, with a long-haired camel's hair pencil, dipped in water, go over as much of the frame as the piece of gold is to cover; take up the gold leaf with the tip of a pencil and carefully place over the wetted frame; breathe on it and it will adhere. Do not attempt to cover too much at a time, and the part of the frame to which the piece is applied must be sufficiently wet. When covered, set by to dry for ten or twelve hours; wipe the burnisher and only burnish an inch or so in length at a time, taking care not to lean too hard, but with a gentle and quick motion apply the tool until the frame is equally bright in every part. (2.) If you care to color your dress yourself, I should advise you to try Aniline Dyes according to directions.

News of the Week.

POLITICAL.

ON Tuesday the Potter, or as it is often called, the Butler investigating committee, had before them Mr. Boulds Baker of Texas, who is supposed to have influenced by a lengthy telegram the appointment of Key to a Cabinet position. Since his bankruptcy, as commission merchant in Galveston, in 1866, Baker has been dabbling in politics, with but little influence in Texas, and less elsewhere. He is an employe of the Post Office, and having declined to give evidence, missed his only chance of becoming famous or even notorious. A batch of letters between Mrs. Jenks and Anderson was handed in by the former. They are all spicey, especially the female's, although these are, now and then, a trifle ungrammatical. Neither party seems to have formed a very exalted opinion either of the good sense or the morality of the other. On Wednesday E. L. Weber, brother of D. A. Weber, Anderson's "pal," took the witness stand. He alone of all the Louisiana crowd seems never to have sought an office as a reward for services in 1876. He testified that before the election in Louisiana, it was the intention of the republican politicians, in whose hands rested the entire machinery for controlling the returns, to secure victory by throwing out some parishes on fabricated protests of intimidation, and to have no republican votes cast in others, so that they might be rejected by the Returning Board, on similar grounds; that in his position as republican sheriff, and intimate of Kellogg, Packard, and all the other republican politicians, he knew of this intention and protested against it as regards East and West Feliciana, but that his protest was disregarded, and the original intention dishonestly carried out, although there was really no disturbance during the election.

He also swore that he saw the notorious Sherman letter; that he read it repeatedly and knows it to have been genuine; and that after his brother's assassination, he hunted it up among the dead man's effects, and destroyed it late in 1877, so that it could cause no more trouble and lest others should profit by what was his brother's disgrace. He adds that both Mr. and Mrs. Jenks knew of the letter; set up claims to be "taken care of" because of that knowledge; that Mrs. Jenks visited the dead Weber's wife at Baton Rouge to get hold of the document; and that, until that sprightly woman testified that she had dictated the letter, he had never heard her or any one else advance such a claim. He also swore to affidavits made by Capt Jenks in New Orleans directly contradictory of his evidence in Washington, and it is said the Committee intend to prosecute the Captain for perjury.

Here is a copy of the so-called Sherman letter, the genuineness of which the committee have spent most of their time in trying to establish.

NEW ORLEANS, Nov. 20, 1876.

"GENTLEMAN: Your note of even date has just been received. Neither Mr. HAYES, myself, the gentlemen who accompany me, nor the country at large can ever forget the obligations under which you will have placed us, should you stand firm in the position you have taken. From a long and intimate acquaintance with GOV. HAYES, I am justified in assuming responsibility for promises made, and will guarantee that you shall be provided for as soon after the 4th of March as may be practicable, and in such manner as will enable you both to leave Louisiana, should you deem it necessary. Very truly yours. "JOHN SHERMAN.

"Mr. D. A. WEBER and JAMES E. ANDERSON.

Gov. Noyes, in the opinion of all candid men, has cleared himself of the charge of trickery in the Florida election. His evidence was clear, and emphatic that he went South without communicating with Hayes, made no promises while there; and only sought that no injustice should be done to his own party, and that it should have fair play. His testimony is fully supported by that of Gen. Lew Wallace, his companion down South; and is hardly contradicted even in details, by that of Dennis, McLin & Co. It was evidently a mistake, and still worse, an injustice, for the democratic managers to have mentioned his name specially in the resolution asking for the appointment of the Investigating Committee. Noyes returns as American Ambassador to Paris on August 1, fully vindicated, whatever may be the action of the Committee.

The sub-committee sweltering down in New Orleans have elicited little, except that Anderson was culpably backward in registering votes in East Feliciana: that in 1874 the parish gave 800 republican majority in a vote of 2,500; that Anderson complained of not being paid for his work, and during the election sought to trade with the democrats, and that these would not believe him under oath unless his testimony were corroborated by other evidence. Reed, the republican member of the sub-committee, has to leave for home on business, so that the two democratic members will, in future, have their own sweet way.

Much discontent is shown by the democratic press at circulars sent by the republican Congressional Committee to republican office-holders, requesting them to contribute a small percentage of their pay towards the expenses of the coming political campaign. Money is not demanded under penalty of dismissal as in past times, but it is urged upon them that funds are needed, and that those who benefit most by republican success should be willing to contribute financially towards it. It grieves the democrats sorely, however, that by this means the rules of Civil Service Reform may be infringed, though there is no doubt but they now tax all their own employes for political purposes, and that in case of their success in the national contest, they would not hesitate to deprive of their entire wages, the very men whom they now protest should not be even asked for a small part of it. Gen. Hartranft declines to be a candidate for the U. S. Senate for Pennsylvania; this leaves the course clear for Don Cameron, so far as the republicans are concerned.

Now comes a strong rumor that E. L. Weber, the great witness for the democratic side before the Investigating Committee, while senator in the Louisiana Legislature, sold out for $2,500 to Pinchback, while the latter was trying to get elected to the United States Senate. Immediately afterwards he is said to have turned about and sold out again for $10,000 to Kellogg, anxious to obtain the same position; while it is reported to be capable of proof that his present testimony in favor of Anderson's stories, has been purchased by a purse of $7,000, deposited in the hands of a New Orleans broker. So utterly corrupt has the present investigation shown Louisiana politicians, that one is ready to believe of them an amount of turpitude incredible with regard even to politicians elsewhere.

MISCELLANEOUS.

Among the economies of Congress has been the stoppage of allowances for the keep of horses to all army officers east of the Mississippi, from Sherman downwards. This causes much discontent and some inconvenience, as officers of cavalry, while on foot, will have to drill their men on horseback. Sherman has had some of his old war-horses shot, and grumbles vigorously and somewhat profanely at this cheese-paring parsimony. Grain is now being shipped on boats at Kansas City, to be sent, via St. Louis, to New Orleans. In future, the Missouri is to be in this way utilized as an outlet for the immense grain crops of the West. Out in Oregon there has been more fighting with Indians, who are constantly being reinforced by belligerent stragglers from other tribes. Lately the Umatillas, having placed their women and children in safety, on their reservation, to be fed and guarded by Uncle Sam, have gone on the war-path themselves to fight the old fellow's troops and scalp his defenceless children. In Idaho, also, the red-skins are busy stealing horses and cattle, and that chronic bug-bear, a general Indian war, is once more threatened.

Gen. Butler has come out flat-footed in favor of the National and Greenback party as against the republicans and democrats, and will, probably be their candidate for Governor of Massachusetts at the next election. In the Allegheny Valley near Pittsburg, on the fourth, there was a terrific thunder and rain storm which struck the city in the afternoon doing considerable harm. Hail as large as chestnuts fell, and many large trees were uprooted. A large one of these fell on a pic-nic party who had fled to it for shelter, instantly killing ten, and seriously injuring fifteen, four or five of whom will probably die. On the same day, lightning also struck and killed a woman near New London, Conn. It is said that Attorney-General Devens has finished his opinion on the eight-hour law, holding that it was intended to give men working for the Government ten hours' pay for eight hours' work, and should be so construed. The maligned mother-in-law has been unfortunate this week—three of her having been shot or otherwise killed in different parts of the country.

The pleasure of Gov. Van Zandt, of Rhode Island, and still more that of his wife, during their summer stay at Newport, will be somewhat spoiled by the robbery from their house of $35,000 worth of jewelry, while they were at tea on Saturday last. Most people are too careless in leaving windows and doors open in summer time, and some people are too extravagant in the jewelry line at all times.

Joseph P. Carr, who married the daughter of George Knapp, proprietor of the St. Louis Republican, and after her death married Lillie Morrison, daughter of Col. Don Morrison and the belle of St. Louis, and who was himself called the handsomest young man in the city, has forged the name of Morrison to a note for $5,000 and disappeared. Gambling and other dissipations were what led to the crime.

Kansas claims to be the banner State for grain this year, good judges estimating that it will send fully 45,000,000 bushels of wheat to market, or about 35 per cent. above the largest yield heretofore known in any one State, California having had the honor so far, with a crop of 30,000,000 bushels. Col. Reno of the 7th cavalry, is ordered to go to St. Paul, Minn., and report to Gen. Terry, commanding in Dakota, with a view to an investigation of his alleged misconduct and cowardice at the battle of the Little Big Horn, where Custer and his men were massacred.

The farmers of Ohio who have lately suffered severely from communists and tramps, are said to be busy forming secret organizations for mutual protection. Every member is to have his gun at all times ready, and be willing to use it in defence of his own property and that of his neighbors, and to be constantly on the look-out for fire. The following is a sample of the notices served on some of them; all such threats being much of the same style: "You better look out; if you don't stop usin' that machine for bindin' you will never hev any grain to thrash out. We are watching you"

On the fourth, at Lexington Ky, old John Harper's Ten Broeck and Mollie McCarthy, the celebrated California mare, ran a four-mile race at which great speed was expected. This expectation, however, was disappointed, for the mare was distanced in the first heat and the race was won in slower time than she had previously made. Some attribute the laggard space to the extreme heat of the day, while others—and among them the trustworthy editor of the Kentucky Live-Stock Record—insist that Ten Broeck was drugged just before the race and that this could not well be done without the knowledge of his owner.

FOREIGN.

The London News agrees with Mehemet Ali that Turkey would have been better off to have accepted the treaty of San Stefano as it stood and never gone to Berlin at all. Yet Beaconsfield is said to be the only person at Berlin who denies that the dissolution of the Turkish empire is inevitable and will have it restored. Schouvaloff, who descends from a line of princes older than the czars, seems to have supplanted Ignatieff in the imperial favor and is a likely candidate for the seat of Gortschakoff. All persons arrested in connection with Nobiling's attempt upon the life of Emperor William of Germany have been liberated, including Nobiling's youngest brother.

Gen. Philipovich, the Sclav general of the Austrian army in Bohemia, has been summoned to Vienna to take command of the army about to occupy Bosnia and Herzegovina. Turkey asks that the term of occupation be fixed at two years But in view of the unforeseen circumstances that may arise, Austria declines to be hampered by any distinct engagement. The troops will not cross the border until the Congress is over. It is highly probable Austria will so manage matters that the occupation will be permanent. There is a rather reliable rumor that England intends to acquire the island of Cyprus, as her share of the Turkish spoils. In Berlin and throughout Germany, numerous arrests still continue to be made of prominent socialists and of hot-headed revolutionists who express chagrin at the failure of the nefarious attempts of Hoedel and Nobiling. The organic, municipal, and provincial laws in Spain are to be provisionally enforced in Cuba.

On the 4th there was a series of boat races on the Thames at Henley, near Oxford, England. Two American crews, the Shoe-wae-cae-mettes of Michigan, and the Columbia of Columbia College, New York City, took part in the races for the Visitors' cup and the Stewards' race. The jaw-breakers of the northwest won in the latter the first heat, but lost the second and the prize, the following day, owing to one of the crew suddenly falling sick, when near the goal, in the middle of the contest. On the 5th, Columbia won the Visitors' cup, beating the picked crews of Oxford and Cambridge Universities. The star-spangled eagle has been soaring away up the empyrean and shrieking himself hoarse ever since. For the China, during which it is calculated upwards of past year there has been a terrible famine in five million people have been starved to death, and now comes the news that in Brazil the springs, brooks and rivers in three important provinces have dried up; crops have not grown on account of the drought, and the people are perishing by thousands. In the city of Aracaty, from February 10th to 18th, 664 persons died of starvation and at least 10,000 people have perished of hunger

in the single province of Cara since the commencement of the calamity. Thomas Guardia, Dictator of Costa Rica, a very wealthy, able and ambitious man, is said to be about to attempt to bring the republics of Nicaragua, Honduras, Guatemala and San Salvador under his rule at the cost of war with them.

Although there are still rumors about difficulties in the Congress at Berlin, especially regarding the boundaries of Eastern Roumalia, most people agree with Bismarck, that peace, for the present, is assured. Batoum, on the Black Sea, north of Armenia, in Asia, has, after many protests, been ceded to Russia, and is to be a free port of entry. In carving up Turkey, Greece must be content with a small slice of Epirus and a bit of Thessaly, though the diminutive kingdom is alternately praying and blustering for more. There is a multitude of rumors with regard to other points settled by the Assembly, but although some of our mammoth dailies have published ponderous articles freighted with much political wisdom on some of these modes of settlement, the very next day's telegrams have sometimes unblushingly contradicted the reports on which the articles were founded. To such ludicrous errors daily papers can afford to give currency, because few remember to-morrow what they say to-day; but the RURAL must be more careful, and therefore defers giving these rumors until something definite is known.

HERMAN.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, July 6, 1878.

The week has been almost a lost one in the regular commeree of this city, owing to the very general and prolonged celebration of the Fourth. Prices for articles, usually largely dealt in, through the changes of New York have been nominal most of the week, while stuff of a perishable nature has had only a chance trade, and that always means irregular prices. Of late years, however, since the Fourth of July has caused such a broken week, dealers and shippers have been quite successful in preventing an over-stock that would result in a severe loss, and the markets are expected to reopen with as much vigor as the warm weather will permit.

BEANS AND PEAS.—There are no new features in beans; prices generally easy and quite uniform for all grades except Red Kidney, which are scarce and high. For government use, 700 lbs. Mediums were sold at $1.70¾ deliverable in Chicago; a Rochester contract. Peas of all kinds unchanged.

We quote medium beans, prime, $1 67½@1 60; fair to good, $1 35@1 50; marrows, prime, free on board ship, fair to good, $1 40@1 50; Pea, $1 40@1 65; white $1 40@$1.62½; kidney, $1.40@1.62; red do., $3@3.25; black, $2.35@2.40; Lima, $3.75@4.25.

Receipts of beans past week, 6,252 bush. Exports of beans, 545 bbls. Exports of peas, 21,032 bush.

BUTTER.—At the close of last week better had become very weak, and there is not much possibility of early recovery when trade renewed, as a neglected week, will be apt to leave some surplus. Western creamery now quoted below State. Extremely hot weather has hurt the sale of tender makes of butter, such as are included in creamery and pails, and there has been more inquiry for hard half tubs. Shippers have operated up to the freight accommodations of steamers, that is, refrigerator room. Receipts of State are now expected to fall off, and moderated supplies may help prices. The exports for June were equal to 22,791 firkins, the largest total in six years for same month.

State creamery, choice, 19@20c.; other, 16@18c.; half tubs and pails, choice, 16@17c.; other, 14@15c.; Welsh tubs, best, 15@16c.; other, 10@12c.; poor State, 5@8c.; State firkins, 15@17c.; Western creamery, choice, 19c.; other, 16@18c.; Western dairy, best, 12c.; other, 8@10c.; factory (ladle packed), 9½@10c.; other, 6½@8c.; milled Western, 5½@8c.; old and grease, 3½@5c.

Receipts for the week, 24,670 pkgs.; exports past week, 4,669 do.

BEESWAX.—Offerings are not large, and the market is very steady at 26½@27½c. for Western and Southern.

BROOM CORN.—The reports from the crop show an average acreage. The plant is backward, an account of the wet season. Trade is small; good to prime hurl quoted at 6½@6½c.; medium green, at 5@6c., and red, stubby and crooked, 3½@4½c.

COTTON.—This has been a dull week, and on the whole but slight changes. Latest prices are for July, 11.02c.; for August, 11.54@11.55c.; for September 11.21@11.22c.; for October, 11.0c.; for November, 10.91@10 92c.; for December, 10.90@10.91c.; for January, 10.95@10.96c., for February, 11.02@11.03c.; for March, 11.09@11.11c.; for April, 11.19@11.20c. and for May, 11.29@11.30c.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted:

	Uplands.	*Ala. Orleans.*	*Texas.*
Ordinary	9 9-16	9 9-16	9 11-16	9 11-16
Strict ordinary	9 15-16	9 15-16	10 1-16	10 1-16
Good ordinary	10 7-16	10 7-16	10 9-16	10 9-16
Strict good do	10 13-16	10 13-16	10 15-16	10 15-16
Low middling	11 1-16	11 1-16	11 3-16	11 3-16
Strict low middling	11¼	11¼	11¼	11¼
Middling	11 7-16	11 7-16	11 9-16	11 9-16
Good middling	11¾	11¾	12	12
Strict good middling	12 3-16	12 3-16	12 5-16	12 5-16
Middling fair	12 11-16	12 11-16	12 13-16	12 13-16
Fair	13 7-16	13 7-16	13 9-16	13 9-16

Stained.

Good ordinary..9 7-16c.; Strict good ordinary.10 7-16c.
Low middling..9 15-16c.; Middling .....11 1-16c.

CHEESE.—There has been a slight easing of prices on the better grades, and on heated lots a very irregular range. The supplies this week have been largely of parcels out of condition, affected by the hot weather, and the comparatively meager showing of first class stock has discouraged shippers, a strictly fancy factory, colored, would bring 8¼, and of white 8¼; but few lots exceed 8¼ and 8, respectively, and standard factories that are heated have sold ¼ under the inside figures.

Quotations are for fancy, 8@8¼c., respectively for white and colored; 7@7¾c. for good and prime; 6½@7c. for fair; 5@6c. for half skimmed; 2½@3c. for skimmed. State, farm dairy at 6¾@7¼c. for good to choice, 5@6½c. for fair to good and 2@3c. for poor skimmed. Wisconsin factory, fine to fancy, 7¾@8c.; do. good to prime, 6¾@7¾c.; do. fair, to good 6@6¾c.; Western factory, fine, full cream, cheddar, 7¼@7¾c.; do. fine, full cream, flat, 7@7c; do. slightly skimmed, flat, 5¾@6¼c.; do. half skimmed, 4@5½c.; do. full skimmed, 3@3½c.

Receipts for the week, 114,056 boxes.
Exports, past week 113,143 boxes.
Gold closes at 100¾.
Liverpool cable quotation, 46, 8d.
Export of cheese for June, 23,415,921 lbs.

DRIED FRUITS.—Apples have some export demand at low prices, but closed quiet. New pitted cherries have been received: the first sale was at 20, but it is now difficult to get a bid of 17.

Peaches—Fancy North Carolina 10@11c.; good to prime Georgia 8@9c.; unpeeled halves, 3¾@4¼c.; quarters, 3¼@3¾c. Pitted cherries, nominally, 17@18c.; Raspberries, 26c.; New York State plums, 10c.; Southern plums, 9c.; Blackberries nominal. Apples—State quarters, 4c.; do. sliced, prime, 4½c.; good, 3½@4c.; Western quarters, 2½@3c.; Southern at 4@4½c. for prime sliced; 3@3½c. for fair to good; Southern quarter, 2½@3c.; Tennessee quarters, in bags, at 2@2½c.

EGGS.—Receipts for the week, 6,808 bbls. We are going into the dullest season for local trade, and prices are unusually low with much of the arrival left over. The fresher the stock the quicker the sale; ice-house lots regarded suspiciously; they do not hold up well or long after exposure.

Near points, 13@14c.; State and Penn., 12½@13c.; Western, fresh, 10c.; Canadian, 10½@11c.; poor stock, 9@9½c.

FRESH FRUITS.—There is a long list in market, though several items will be gone after this week. The remnant of strawberries came from Oswego sold at a range of 4@7c.; selections, 11c. qt. Raspberries are lower, Black caps, 6@7c. qt.; Red Brandywine, 8@10c.; Antwerps, 3ds, 4@5c.; Native, 2½@3c.; Apples are abundant but good stock scarce and the range of prices is wide. Nort. green, $1.50@4.00 bbl.; Red astrachan, $5@6. Whortleberries, $4@4.50 bush. Currants small, 2@4c. lb.; Cherry, 6@8c.; Black, 7@8c. Blackberries, cultivated, 8@11c. qt.; Choice wild, 5@7c. Fancy cherries, western N. Y., 10@12c.; Fair, 8@9c.; Sour, 9@12c. Peaches have been scarce and ruled high as the demand was active for the holiday; Marylands are in but run poor, $1.50@2.50 per crate; Choice Georgia, $4@5; other, $1.50@2; S. C., $1.50@2 50; N. C., $1.50@3.50. Watermelons low; Florida, $20@30 per C.; Char. $30@35; Georgia, $25@35. Hot-house grapes B. Hamburg, 50c. lb.; Sweet water, 30@40c. Receipts of Peanuts are larger and prices are lower and demand only fair: Hand-picked Va. $1.55; Fancy, $1.45; other, $1.20@$1.35.

FLOUR has improved, to a considerable extent on export demands, and prices have reacted a little and closed in the seller's favor.

Latest prices are $3.15@3.85 for very inferior to very choice superfine State; $3.90@4.15 for very poor to very good extra do. odd lots and lines; $4.15@4.45 for good to fancy do.; $3.15@3.85 for very poor to very choice superfine Indiana, Iowa, Michigan, Ohio, &c., $3.90@4.15 for inferior to very good shipping extra do. and $4.15@4.45 for very good to very choice extra do.; common to about choice white wheat extras, $4.30@5.40; choice to very fancy do. at $5.50@6.50; red and amber winter wheat, inferior to very choice trade and family at $4.15@5.75; round hoop Ohio at $4.00@$4.30, and trade and family brands of do. at $4.35@$5.75, the latter rate for choice, (very choice to fancy lots quoted higher); St. Louis, $4.25@5.00 for very poor to good extra, and $5.00@6.30 for good to very fancy; Minnesota clear, very inferior to very choice, at $4.10@5.00; Minnesota "straight," inferior to fancy, at $5.25@6.50, and patent poor to strictly fancy at $5.25@8.00; unsound stock at from $2.00@5.25; city mill extra at $4 10@5.25 for West Indies; do. for England, $4.00@4.15; do. trade and family extras, $5.65@6.75; do. for South America, $5.25@6.00 for fair to fancy; No. 2 $2.25@3.00 for inferior to fancy.

CORN MEAL.—Sales at $2.75@2.80 for Brandywine, and $2.10@2.35 for Western yellow.

GRAIN.—Reports of rainy weather affecting the crop prospects abroad, and higher markets there, have infused more life into the markets here, and prices have advanced.

Latest sales of wheat are of No. 2 red at $1 10@$1 11; ungraded red western at $1 08@1 11; amber western at $1 12@$1 13; ungraded white western at $1 10@$1 13; No. 1 white at $1 18; new amber Southern at $1 05@1 06; No. 1 Milwaukee and Minnesota spring at $1 07; No. 2 Chicago spring at $1 03@$1 03½; New York No. 2 spring at $1 02½@$1 03; No. 3 spring, in lots, at 98@98c.; ungraded spring at 92@98c.; No. 2 red, July option at $1.05@1.06 do. August delivery, at $1 03, No. 1 Minnesota spring, July delivery, at $1 08; New York No. 2 spring, July delivery, at $1 02½@$1 03; do. August delivery, at 98c.; do. September delivery, at 95@ 96c.; No. 2 northwest spring, July delivery, at $1 03. Rye at 62@64c. for State and 60@62c. for western. Corn—at for No. 2, July option, at 45½@46¼c.; No. 2, August option, at 46¾@47¼c.; c.; steamer mixed, July option, at 44¾@45½c.; do., August option, at 44¾@45½c.; spot lots New York No. 2 at 45¾@46¼c.; Kansas mixed at 46@46¾c.; steamer mixed at 44@45½c.; ungraded mixed at 42@46¾c.; New York No. 2 at 41½@42½c.; western yellow at 46@47¾c.; steamer yellow at 42¾c., and western white at 53¾c. Oats at for New York No. 2 white at 32¾@33c.; New York No. 1 at 31c.; New York No. 2 at 30@30½c.; white western at 32¾@37¾c.; mixed western at 30@33½c.; white State at 32¾@35½c; mixed State at 30@31¾c.; New York extra white quoted at 36@37c.; New York No. 1 white at 36c.; New York No. 3 white at 31@31½c.; New York extra at 31@31½c.; New York No. 3 at 29@29¾c.; No. 2 Chicago at 31c.

HAY AND STRAW.—There is a little new hay in the receipts, and the old crop is coming in yet freely, with prices unsettled.

Bale hay, 45@55c. for shipping, and 60@75c. for retail qualities; Straw quoted at 40@50c. for long rye, and 35@40c. for short rye; and 30@35c. for oat.

Exports for week 463 bales.

HOPS.—There is a lull in the market. Supplies of desirable lots are small, and trade is necessarily of a limited description. Prices hold steady. New Yorks, good to prime, 10@12c; do., low to fair, 7@9c.; Eastern, 7@10c.; Wisconsin, 7@10c.; Yearlings, 2@3c.; Olds, all growths, 1@2c.; Pacific Coast hops, 10@12c.

OIL CAKE has sold at $28.50 per ton, which is a decline.

POULTRY AND GAME.—Live poultry has been in heavy supply, and fowls and chickens are very low. N. J. chickens, 15c; Southern and Western, 12@13c.; Near-by fowls, 10@11c.; S. & W., 8@9c.; Turkeys, 9@12c., few wanted: Ducks, Choice, including Spring, 60@75c.; common, 40@50c.; N. J. Geese, $1.25@1.50; S. & W., 85c.@$1.25.

The demand uses up the small recipes at following rates: Turkeys, dry picked, 13@15c.; other, 11@14c.; Phila. Spring Chicks, 20@22c.; N. J., 17@18; Western, 15@16c.; Fowls, Phila., dry picked, 13@14c.; good, 10@11c.; common, 9c.

Stall fed pigeons make the game list at present, quoted $1.00@$1.25; same, squab, $1.75 doz.; Woodcock, saleable after August 1st.

PROVISIONS.—Hog products have been depressed and dull. Mess pork quoted $10 12½@10 37½ for spot lots; $10 10 for August, and $10 20 for September. Bacon at 5¾c. for long clear. Lard at $7 12½ for spot; $7 05 for July and 7 15 for August; $7 20@7 22½ for September. Stearine at 8¼ for prime. Tallow at 6 15-16@7 for prime. Beef hams at $22@22 50. Beef—For extra mess, $11 75@12; plain mess, $10@11 50; packet, $10 50@12 30 for bbls.; extra India mess, $19@21 for city brands; do. Philadelphia, $18.50@$19.

VEGETABLES.—Supplies of all kinds are heavy and prices generally easy. Southern stuff can now hardly compete with Northern. L. I., Norfolk and Maryland potatoes, $1.75@2 bbl.; Culls 75c.@$1: exports potatoes past week, 590 bbls. Green peas have rarely been so cheap: L. I., 2 bush. bag, 30@50c.; L. I. string beans, bag, $1. Nor. cucumbers, crate, 50@75c.; L. I. and N. J., per 100, $1@1.25; Fla. egg plant, crate, $3. Nor. tomatoes, crate, $1@1.50; Fla. and Chas., 75c.@$1.50 as to condition. Bermuda onions, bush., 50@65c.; Southern, bbl., $1.50. Squash, bbl., 50c.@$1. Radishes, 100 bunches 50c.; Beets, do., $1@1.50; Carrots, do., 50c.@1; Turnips, 75c @$1. Spinach, bbl. 5'@30c. Cabbage, flat Dutch, $4@6 per hundred; Wakefield, 3@4. Cauliflower, $1@3 bbl. R. Turnips, bbl. new 75c.@$1.

WOOL.—The advance made last week on the excitement in the country is barely sustained, as the later reports show a quieter feeling at the West. There is but little doing here.

Ohio, Pennsylvania and Virginia quoted at 40@43c., for XXX and picklock; 36@38 for XX; 35@37 for X 36@39 for No. 1.

New York, Michigan, Indiana and Wisconsin. XX, 33@35c.; X, 33@35c.; No. 1, 35@37c.; No. 2, 30@33c.

Iowa, Vermont and Illinois 30@32c. for X and XX; No. 1 32@35c.

Missouri, Kentucky, and Tennessee — Washed fleece, 30@31c.; unwashed, 23@26c.

LIVE STOCK MARKETS.

NEW YORK, Saturday July 6, 1878.

BEEVES.—Receipts for the week, 8,964 head: do., last week, 9,490 do. A light supply met with a dragging market at the close and there was no improvement upon Wednesday's prices. Distillery-fed and coarse Texas steers sold at 8¼@8¾c.; other decent to extra stock, 8@10c., with a few tops at 10¼c., to dress 57 lbs. Considerable stock was held back at Albany.

MILCH COWS.—No transactions to report. Good cows worth more, or as much, at home than here.

VEAL CALVES.—It has been mostly a low week for calves, but at the close the market is better. N. J. and Bucks Co., 6¼@7c. for prime: good, 6@6¼c.; State, 5¼@6¼c.; buttermilk calves dull and low, 2@2¼c.

SHEEP AND LAMBS.—Receipts for the week 26,109 head; do. last week 23,171 do. Market dull, especially for lambs. N. J. ewes, 3@3¼c.; other, 3¼@4¼c. Lambs, extra, 6¼c.; good, 5¼@6c.; Va. and Ky., 5@6c.

SWINE.—Receips for the week 25,443 head; do. last week 22,811 do. Market quiet; 'Change closed for two days. Nominal price for prime hve, 4¼@4½c.

THE HAIR is Rendered Soft and Pliable, and its vigorous growth promoted by the timely use of Dr. Jayne's Hair Tonic. Being a good dressing for the hair, and an excellent tonic for the scalp, any one threatened with baldness should give it a trial.

Reading for the Young.

"POCKET-MONEY FOR THE YOUNG PEOPLE."—No. 9.

MRS. A. E. STORY.

Did anyone ever know a spirited young person who did not prefer earning his "spending-money" to having it as a gift from his elders? It is well, too, that young people should know "how the money comes" which is theirs to spend. It trains them to a habit of self-reliance. If the boy or girl who has to work patiently for the wherewithal to purchase the various little needs and pleasures so dear to the heart of youth, does not develop into a painstaking, economical man and woman, the personal experience of thousands who had to earn the pennies that went to pay for their holiday whistles, goes for nothing.

My young friend, to avoid the disagreeableness of doing something for which you have no liking, or what is worse, leaving it before it is fairly begun, turn the question "What shall I do?" over in your mind before you set to work. If you have a taste for poultry rearing and none for gardening, keep out of the garden by all means. If you have no fancy for poultry, you will most likely be on the lookout for a calf or two, or a pig or a lamb, to raise on your own account. Calves, toward which youthful eyes are often turned with longing, are killed because the milk cannot be spared for them. In such cases hay tea, with just milk enough to give it the color of coffee, has been found an excellent substitue. The tea should be made daily,—enough each time for two feeds.

In some families the eggs over and above a stated number each day, are given to the child who gathers them. This answers for the "little shavers," and if anyone thinks there will be many hens sitting around on stolen nests, let him try it and see. In the same way the surplus butter goes to "the girls" to do as they please with it, and when this is done, even young girls, provided they have been properly taught, may be safely trusted with the milk work without fear of having quantities of cream, at every skimming, left in rims around the pans, or otherwise wasted.

A pair of canary birds provided with a nest—a collar box stuffed with cotton to the proper shape, and lined with flannel, makes a good one—and given a little extra care in the way of keeping the cage supplied with food suitable for the young, may be made a source of profit. The proper food for the young birds is the yolks of a hard-boiled egg, made fine and mixed with double the quantity of bread crumbs. Nothing else, save water and, of course, seed for the old birds, should be given. Green food of all kinds must be kept away until the young ones are out of the nest, which will be in about two weeks after hatching; and by that time the mother-bird will have commenced laying again. To get the young birds out of her way, put them, as soon as they begin to peck at the contents of the feed-dish—which should be kept in the bottom of the cage—into another cage. A healthy bird, if not too old, will rear several broods before the molting season, when the nest should be taken away. A male bird often sings a *very little* when it is but three weeks old. If a bird has not been heard to sing by the time it is six or seven weeks old, you may be pretty certain it is not a singer. One thing more: do not allow the cage to be taken from its place after your bird has commenced laying, until the eggs are hatched.

Here are several ways by which boys and girls may "pick up a little money" at certain seasons: By nut-gathering, especially if you live where chestnuts abound. They do not fill the measure so fast as some other kinds, but they sell for more. By saving cherry stones, peach pits, apple seeds, etc., for the nursery-men. To get the apple seeds: take the cores after a quantity of the fruit has been pared and quartered, as for drying, put them in a barrel with water enough to float them, "churn" them for a few minutes with a churn-dasher, skim out the cores and find the seed, a quart, or less, in the bottom of the barrel.

Then for boys, there is the trapping of minks, musk-rats, raccoons and other furry animals; but what farmer's son doesn't know all about that? How many a warm breakfast has been forgotten till it was no longer warm, while John, or Fred, or Tom, went whistling off to the brook where his half-dozen Oneida Communities were set? Shooting game, too, is a pastime which many boys contrive to turn to good account financially, and when the passion for hunting is not indulged in at the expense of the corn-husking or apple-gathering, who shall say that the boys are injured by it?

LETTERS FROM BOYS AND GIRLS.

A Giantess.

Dear Uncle True:—I am a new cousin seeking an introduction. I have often wished to write before, but visions of a grim editor and a huge waste-basket loomed up before my mental vision, and so terrified me that I never could pluck up courage to commit myself to paper. But this evening, as I was reading the Rural, I could contain myself no longer. So now, after having spread myself over forty acres, more or less, of paper, I proceed to introduce myself. I am Giantess, at your service. Now, what I want to know is this: What has "Slayerofconceit" done? We missed six or seven Ruruls since the 1st of January, so I am somewhat in the dark. "Wild Cherry," you write that you "feel like saying *dreadful* things of him, but suppose you must not." I see he has been catching it right and left, so I have felt for some time that I must take his part. Poor fellow! everyone seems to be down on him. But I see, Wild Cherry, that you hint at his thinking himself wiser than mankind in general, also that he speaks slightingly of girls. Now I tell you he touches me there! for I am a girl. Beware how you rouse me, for remember, I am a Giantess! Good for you, Wild Cherry, just stick to your version of the couplet concerning whistling girls. I whistle too—when I wish to. Hurrah! for Brown Badger. I just tell you that you must stick to your resolution not to use liquor of any kind. But there! I never have been credited with knowing enough to stop.

Giantess.

"They Write too Old for their Age."

Uncle True:—I scarcely know how to introduce myself. But for this I should have joined the Cousins long ago. I have just read Wild Cherry's letter and like it, except that I have the same opinion of her letter that I have had of many others among the Cousin's letters: they write too old for their age. I am neither sixteen nor sixty. You can guess all the way between—and under—if you choose; but please do not go abroad to find the indefinite article. I have not the faintest hope that my letter will prove interesting to the Cousins, as theirs have been to me. I have been a reader of the Rural for many years—if I should tell you how many, you would easily guess my age. In good time, I will tell you, if some one don't guess it in the meantime.

Unknown.

Sabbath Reading.

DECREED.

"Into all lives some rain must fall,"
Into all eyes some tear-drops start,
Whether they fall as a gentle shower
Or drop, like fire, from an aching heart.
Into all hearts some sorrow must creep,
Into all souls some doubtings come,
Lashing the waves of Life's great deep
From dimpling waters to seething foam.

Over all pathways some clouds must lower,
Under all feet some sharp thorns spring,
Tearing the flesh to bleeding wounds,
Or entering the heart with their bitter sting.
Upon all brows rough winds must blow,
Over all shoulders a cross must be lain,
Bowing the form in its lofty might
Down to the dust in bitter pain.

Into all hands is some duty thrust,
Unto all arms some burden given,
Crushing the heart with its dreary weight,
Or lifting the soul from earth to heaven.
Into all hearts and homes and lives
God's dear sunshine comes streaming down,
Gilding the ruins of Life's great plain—
Weaving for all a golden crown.

INTERRUPTIONS IN OUR WORK.

E. M. G.

"We are created in Christ Jesus unto good works, which God hath before ordained that we should walk in them."—Eph. ii. 10.

He who tries to infuse this spirit into his daily work will do it earnestly. He will throw all his powers of heart and soul into it; and whereas before much of his duty has been done mechanically, his nobler faculties will now be called into exercise in the doing of it.

And the very earnestness with which the work is now done may bring with it a snare. When the mind is intently bent upon one action, and that action is felt to be a serious one, it is greatly embarrassed and annoyed by interruptions. Other things making a claim upon the attention, distract and harass us. Of course it is not so with the man who hangs about upon life with no serious pursuit. Interruptions are to him a pleasing variety; nor can he at all appreciate the trial of which we speak. But in proportion to the seriousness with which the Christian does his work will be, if I may so say, his sensitiveness to interruptions. And as this sensitiveness is very apt to disturb his peace (and in so doing retard his progress), we will show the manner in which interruptions should be met, and the spirit with which they should be encountered.

The great remedy, then, for the sensitiveness to which I have alluded, is a closer study of the mind that was in Christ, as that mind transpires in His recorded conduct. The point in the life of Our Lord to which I wish to call attention, is the apparent want of what may be called method or plan in His life,—I mean method or plan of His own devising, the fact that his good works were not in pursuance of some scheme laid down by Himself, but such as entered into God's scheme for Him, such as the Father had prepared for Him to walk in. And, first, notice His discourses, both in their occasions and in their contexture.

They most often take their rise from some object which is thrown across His path in nature, from some occurrence which takes place under His eyes, or from some question which is put to Him. For the wonderful discourse in John vi. upon the Living Bread, we are entirely indebted to the circumstance that after the miracle of the loaves the carnal multitude sought Him, in anxiety to have their natural wants once again satisfied by miracle. It was not that Jesus had previously prepared them for such a discourse; but this was the discourse which their conduct drew from Him.—He meets a Samaritan woman at Jacob's well, and oppressed with the noontide heat, asks her for water from her bucket. Her answer leads on to a close dealing with the woman's conscience, and to the announcement of certain great truths respecting that living Water, whereof whosoever drinketh shall never thirst. But here again the words rise spontaneously from the occasion.—The murmurs of the Pharisees and Scribes, because Jesus received sinners and ate with them, elicited for our everlasting consolation the noble parables of the lost sheep, the lost coin, and the prodigal son.—An observation falling from a guest at table, a mere devout sentiment casually dropped in His hearing, "Blessed is he that shall eat bread in the kingdom of God," drew from His lips the parable of the great Supper.—A certain man asked Him to undertake an arbitration between himself and his brother as to their respective shares of their hereditary property. This suggested to Our Lord the topic of covetousness, and the parable of the rich fool, illustrative of that topic.

All the above are instances in which Scripture itself explicitly *traces* the connection between certain occasions and the discourses of Our Lord. And divines have recognized many others, where the connection, though not expressed, is not obscurely implied.

But a similar remark holds good respecting the contexture of these wonderful discourses. For Our Lord's great discourses are not constructed upon any such method or plan as the human intellect recognizes. Take the Sermon on the Mount, and try to analyze it. You will find that it defies methodical analysis. While no head of Christian precept is left untouched, there is no such systematic arrangement as we can easily put upon paper. There was no doubt an undercurrent of thought in the mind of the Divine Preacher, welding together the different sections of the great Sermon, and leading Him on fluently from topic to topic; but nothing can less wear the aspect of a discourse framed upon a dry preconceived plan. Doubtless it was as the swallow caught His eye, skimming along to its nest with food for its young, and as the lily or blue-bell of Palestine waved before Him on the hill-side, that He took occasion to illustrate His precepts against worldly carefulness by those wonderful sections, beginning, "Behold the fowls of the air," "Consider the lilies of the field." This is the only plan observable in the discourse,—the plan of a loving heart pouring itself out, as occasion serves, for the edification of mankind.

But the absence of mere human plan, or rather strict faithfulness to the plan of God, as hourly developed by the movements of His Providence, characterizes the life of Our Lord even more than His discourses. His object throughout is not to carry out schemes preconceived by Himself, but to study God's guidings, and to be true to God's inspirations. Take only that portion of His life recorded in a single chapter,—the ninth of St. Matthew. Jesus is interrupted in the midst of a discourse which He was holding in the house, by the appearance of a couch with a palsied man upon it, lowered into the midst of the court under His eyes. So far from accounting the interruption unseasonable, He first absolves, and then heals the patient, and thus secures glory to God from the multitude. The miracle performed, He passes out into the open air, perhaps for refreshment, and His eye catches Matthew sitting at the receipt of custom. He calls him, and Matthew follows. Matthew invites Our Lord to a meal, and our Lord accepts the invitation; sits down with publicans and sinners, and profits by the occasion to speak of the freeness of His Grace.—In connection probably with His appearance at a festival, the disciples of John ask Him why *His* disciples did not fast. He explains why. Jairus comes to solicit His merciful interference in behalf of a dying daughter. Jesus follows him forthwith to his house, when, lo and behold, another interruption, which to the feelings of Jairus, all impatient to have the great Healer under his roof, must have been extremely galling. The woman with an issue of blood steals a cure from Him on the road. Jesus stops to draw from her an acknowledgment of the benefit, and to dismiss her with a word of consolation and blessing. Then He resumes His former errand of love, arrives at Jairus' house, and raises the dead maiden.—Coming out, probably on His return to His own abode, the blind men follow Him into the house, and receive their cure.—They have scarcely gone out, when the man possessed with a dumb devil is brought to Him, and restored; and thus ends the detailed portion of the chapter, what follows being a general and summary survey.

This is a good specimen of Our Lord's whole way of life, and of how He went about doing good, not on a rigid, unbending, preconcerted plan, but as the Father, in the course of His Providence, ministered to Him the occasion.

Now, as God ordained beforehand certain good works in which the Son of His Love was to walk, so He deals with each follower of His Son, according to the humble capacity of that follower, on a similar principle. Christian, whoever you are, whatever your station, God has a plan of life for you, a plan of doing good,—certain occasions and opportunities of doing good all mapped out for you in His eternal counsels. These occasions and opportunities are to arise day by day upon you, as you pursue your beaten path of life, just as while the globe turns round upon its axis, the sun in course of time rises upon those parts of it which before were dark. Now this, perhaps, is a novel view to some of my readers. They are accustomed to think of the place which Our Lord has prepared for His followers,—of the joys which God has prepared for those who unfeignedly love Him;—but they think comparatively little of the sphere of good works, which is just as much prepared for them to occupy here as is the sphere of glory hereafter. Yet this is a certain and infallible truth. If God hath before ordained certain persons to eternal life, He hath also before ordained good works for those individuals to walk in.

Do you believe that the whole of your affairs—trivial as well as great, irregular as well as in the ordinary course—are under his absolute, daily, hourly supervision and control? that nothing can possibly arise to you or any other, which is not foreseen by Him, arranged for by Him, brought by Him within the circle of His great plan? that the little incidents of each day, as well as the solemn crisis of life, are His ordering? Then you virtually concede all that the Apostle asserts in this verse. For you admit that the occurrences of each day, however unlooked for, however contrary to expectation, are God-sent, and those which affect *you* sent specially and with discrimination to yourself.

Now it cannot be thought that God sends events to a living soul, in order that the soul may be simply passive under the events. If God sends you an event, it must have a meaning; it must be a sign to you that you are to do something, to brace yourself up to some action or to some state or feeling. All that God sends to a human spirit must be significant. God has sent us His Word. We know that He designs us not simply to hear it, but to embrace it with a living faith and a loving obedience. We are to meditate upon it, to apply it to our consciences, mold our character and conduct in conformity to it. Now the same God who has sent us His Word equally sends us the daily occurrences of life, the chief difference being that, whereas the Word has a general voice for all, in which each is to find his own case represented, the occurrences are charged with a more specific message to individuals. Now there is many a man who says, "I will conform myself to the general indications of God's Will made to me by His Word;" comparatively few who say, "I will conform myself to the special indication of God's Will made to me by his Providence." But why so few? Does not God come home to us more closely, more searchingly, more personally by His Providence than even by His Word? Does not His finger rest upon each of us more particularly in the government of affairs than even in Revelation? And why are we to imagine, as many seem to imagine, that no other events but such as are afflictive and calamitous have a voice for us? Why not every event? Why is not the ordinary intercourse of life to be regarded as furnishing in God's design and intention opportunities of either doing or receiving good? I say of doing or receiving good. Surely either one or the other is a thing greatly to be coveted. In nine cases out of ten we may fail of doing good; but if in those cases we have received good, and received it too in the course of His plan for us, and in the way of His Providence, surely the occurrence which has called us off from our ordinary pursuit is not to be regretted.

Here, then, lies the real remedy for the uneasiness of mind which is caused by interruptions. View them as part of God's loving and wise plan for your day, and try to make out His meaning in sending them. When in your hour of morning devotion you distribute your time before hand (as it is in every way wise and proper to do), let it always be so with the proviso that the said arrangement shall be subject to modifications by God's plan for you, as that plan shall unfold itself hour by hour to your apprehensions. When you have entered upon the day, observe narrowly the quarter in which His finger points, and be true to that direction. There lies thy prepared task. There are the good works, not which thou hast devised, but in which God hath before ordained that thou shouldest walk. A case of distress is flung in your way as you are bound upon your daily occupations. The spirit of the age says, "Dismiss it,—you have no time to spare,—leave it to the Poor-house and pass on." Or it is suggested, in the midst of your avocations, that there is some word of sympathy to be said or to be written to a friend in trouble, only a cup of cold water in point of intrinsic value, but still a very refreshing one to a man in the furnace of affliction. "But you are too much occupied," says the busy, bustling, hard spirit of the age; "you have no time for sympathies or sentimentalities; you must go forward; if you desire to be successful in life, you cannot afford to stop on the way." Now without denying that in particular cases such counsel may admit of palliation in a greater or less degree, truth compels us to say that this was not the mind which was in Christ Jesus.

His ear was never inaccessible to human suffering, and His mind was never unobservant of God's plans. He does not pass over the woman with the issue of blood. He does not leave her without her lesson and without her consolation, because he is bound on an errand of love to the house of Jairus. He does not make occasions bend to Him; but, knowing that occasions are the Father's call, He addresses Himself to serve occasions. He is constantly redeeming the opportunity."

But supposing that during the day no opportunity occurs of *doing* good. Supposing, for example, that the case of distress into which we have patiently examined turns out, as it very frequently will, to be a gross imposture,—have we, therefore, lost our labor in a spiritual point of view? Not surely, if we have conformed our will to God's design for us. The radical fault of our nature, be it remembered, is self-will; and we little suspect how largely self-will and self-pleasing may be at the bottom of plans and pursuits, which still have God's glory and the furtherance of His Service for their professed end.

The path which we have indicated is the path not of sanctity only, but of peace also. We shall never serve God with a quiet mind, unless we more or less tread in this path. It is a miserable thing to be the sport and prey of interruptions: it wastes the energies of the human spirit, and excites fretfulness, and so leads us into temptation, as it is written, "Fret not thyself; else shalt thou be moved to do evil." But suppose the mind to be well grounded in the truth that God's foresight and fore-arrangement embraces all which seems to us an interruption,—that in this interruption lies awaiting us a good work in which it is part of His Eternal counsel that we should walk, or a good frame of mind which he wishes us to cultivate; then we are fore-armed against surprises and contradictions; we have found an alchemy which converts each unforeseen and untoward occurrence into gold; and the balm of peace distils upon our heart, even though we be disappointed of the end which we had proposed to ourselves. For which is better, safer, sweeter,—to walk in the works which God hath before ordained, or to walk in the way of our own heart and in the sight of our eyes?

PERSONAL ITEMS.

Matthew Arnold is very near sighted.

The stem of Carlyle's clay pipe is very long.

Ex-Congressman Vance is now in a lunatic asylum.

Young Fremont is to be his father's secretary in Arizona.

The Duchess Dowager of Montrose won $52,500 at the Derby.

Edward S. Stokes, who killed Fisk, is now a Detroit book agent.

Prof. Fawcett, the blind M. P., is passionately fond of fishing and hunting.

Count Andrassy has a brilliant and penetrating mind and a fascinating manner.

The Shah sports a thin, waxed moustache, and wears a frock coat and blue eye-glasses.

General Grant is said to look exceedingly well, light-footed, red-cheeked and bright-eyed.

Count Schouvaloff is the handsomest diplomat in Europe, fifty-five, white-haired and keen-eyed.

Life-size portraits of Anderson and The Jenks have been ordered by the Sazerac Lying Club, of Austin, Nev.

Vice-Admiral Popoff of the Imperial Russian navy, the inventor of the circular ironclad bearing his name, has been stricken by partial paralysis.

R. L. Potter, the wheelbarrow idiot, who is shoving a creaky push-cart all the way from Albany, New York, to San Francisco, has passed his half-way point.

In Board of Trade phraseology, Gortschakoff tried to "bear" the stock at the congress, while Beaconsfield resolved either to (John) "Bull" it, or bullet. That's our first attempt.

Thomas Ewing Sherman, the son of General Sherman, who has gone to England to become a Jesuit, is twenty-two years old, and is a young man of very scholarly tastes, who was educated at the Yale College Law School.

Olebillallen is described as being "youthful, rosy and as full of the fire of conquest as a mule colt." He expects to be the next President and to be called "the Patriarch President," for his years will number ninety-four in 1880.

Mr. Alexander H. Stephens is now enjoying better health than for many years past. The secret of his strange vitality is said to be a remarkably sound stomach, which, during his long illness, has never failed to perform its functions.

Mrs. Fanny Fairchild Bryant, wife of the great poet, was born in 1797, and died in 1868. She was described by her husband as "An humble disciple of Christ, exemplary in every relation of life, affectionate, sympathetic, and sincere, and ever occupied with the welfare of others."

In a list of British pensions, and sinecures, in 1810, appear the names of Edward Shippen Arnold, James Robertson Arnold, George Arnold, and Sophia Matilda Arnold—the first three for £400 a year, the last for £100. They are pensions by royal sign manual, and a note is appended: N. B. —These are the children of the notorious American General Arnold.

Prince Bismarck is not an early riser and is fond of sitting up late at night, chatting over a bottle of wine or a glass of beer. It is said that nearly all his diplomatic negotiations, beginning with General Govonne's confidential overtures in 1866 for an alliance between Italy and Prussia, until the most recent *pourparlers* on the Eastern Question, have been transacted by him in a convivial way in the nocturnal hours.

Lord Castlereagh's mission cost, in 1814-15, $200,000, and England will have to pay a pretty long bill in Berlin and Constantinople. The British suite occupy at the Kaiserhof, Berlin, twelve sitting and eighteen bedrooms, besides seventeen servants' rooms, probably more than all the other representatives put together. Beaconsfield's reception room is furnished in the style of Louis XIV., his dining room in old German fashion.

Samuel J. Tilden, as a stockholder of the bankrupt Michigan Iron Co., was sued in Detroit by a laborer named Andrew Young, who recovered judgment. Tilden carried his case to the Supreme Court of Michigan, claiming that it had not been shown that he was actually a stockholder when the debt accrued, and that the corporation had not been made a co-defendant. The Superior Court has just affirmed the judgment below. The liabilities incurred in this way by Tilden will amount to upwards of $25,000, Young's case being a "test" case.

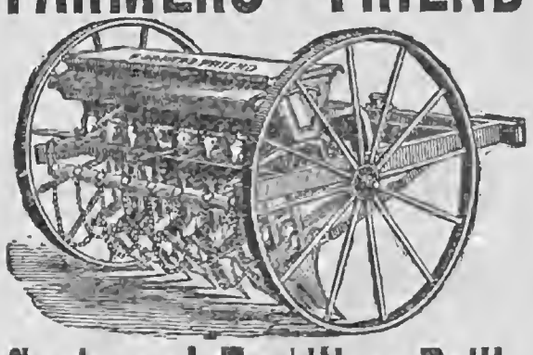
Of Lord Beaconsfield innumerable *mots* are just now current. Here is one: "A Conservative peer was expressing to the Premier the anxiety with which he looked forward to his prolonged absence from England. 'It won't be a long business,' was the reassuring reply; and, after a pause, Lord Beaconsfield added, 'We mean to carry the position by a koo di mang' (coup-de-main). The peer in question moved away, muttering as he went, 'They may say what they like about his being a foreigner, about his character being un-English; but, at any rate, there is one thing that is unmistakably British, and that is—his French.'"

Madame Patterson-Bonaparte, now 93 years of age, appears as plaintiff in a lawsuit brought at Baltimore, where she has resided since her birth. The affair is made the pretext for telling her romantic story, which has been narrated time and again through all the generations of the republic of America. Though abandoned by Jerome at the command of his imperial brother, she still believes in the family, and hopes to see the dynasty resume the throne of France. Her present suit is for the purpose of escaping taxation on $472,000 worth of bonds, and as she has a great deal of other property also, there is little fear of her old age being pinched for lack of funds.

Implements and Machinery.

ELASTIC
GALVANIZED CABLE STRAND
For Fencing.
PROOF AGAINST CATTLE, FIRE AND RUST.
HANDSOME AND DURABLE.
PHILIP S. JUSTICE,
14 North Fifth St., Philadelphia.

FARMERS FRIEND



Grain and Fertilizer Drill.

The quantity is regulated with gear-wheels in a CONE, so there are no loose wheels or movable feeders, and it will sow any grain perfectly and accurately.

It has the best **Spring Hoe**, and every Drill has a **Force-Feed Grass-Seeder, Patent Shifter** and **Surveyor** free.

Illustrated Catalogues, with description, prices and a **Full Centennial Report** sent on application. Agents wanted in unoccupied territory. Address, stating where you saw this notice.

FARMERS FRIEND MANUF'G CO., DAYTON OHIO.

Sold on trial and guaranteed cheaper, at its price, than any other Hay press as a gift or no sale. Don't be swindled by irresponsible manufacturers of infringing machines, as the purchaser is liable. It costs no more for a good press than an inferior or worthless one. Address, P. K. DEDERICK & CO., Albany, N. Y

THE McSHERRY

Force Feed Grain Drill

Is the Machine upon which you can always depend. It is very easily regulated and managed, and possesses every requisite of a perfect Grain Drill. Years of successful use, without change of feed arrangement or any essential part, with its constantly increasing sale, prove in arguments stronger than words that it is the best and most satisfactory Drill to buy.

It sows Fertilizers splendidly.

The McSherry Drill received Highest Awards at the Centennial.

Send for Pamphlet. Mention this paper in your letter. **D. E. McSHERRY & CO., Dayton, Ohio.**

Horse-Powers,

For One, Two and Three Horses.

MACHINES FOR
Threshing and Cleaning Grain
and Sawing Wood.

Patented, Manufactured and Sold by
A. W. GRAY'S SONS,
Middletown Springs, Vt.

The machines with the improvements are the result of more than thirty years' careful study and experiment.

The proprietors are the inventors, ever have been and still are the sole manufacturers.

We have labored from the first to produce machines that will be durable, tasty, compact, portable, and that will run with the least possible friction.

We believe that we manufacture the best machine of the kind in the country.

Our machines have never failed to receive the highest award at all competitive exhibitions.

Circulars and Price Lists free. Address as above

Implements and Machinery.

THE OLD, RELIABLE

TAYLOR RAKES.

Five Different Styles, including Foot, Hand and Self-Dump.

Taylor's Self-Dumping Rake (No 4) has been greatly improved for 1878. This Rake made a great success last season, and is now the best Self-Dump Rake in the market.

These are the only Rakes ever offered the farming community that have proved a Complete Success, in all kinds of Rakings, in the United States, Canadas, British America, and in Europe and Australia.

Illustrated and Descriptive Circulars free. Address **E. C. TAYLOR, Dayton, Ohio.**

Wit and Humor.

IN THE SWEET BY-AND-BY.

THE lawyer leaned back in his easy chair,
His client stood nervously by,
And the man of law sang, till the office walls rang,
"All right; in the suc it, by-and-by."

Cheerfully warbled the butcher,
Blood in his apron and eye;
"Summer is no time for puddings,
Wait for the suet by-and-by."

"Ah me," groaned the man with the meerschaum,
"I'll color it yet, or I'll die;"
And he threw his cigars out of the window;
"Give me this weed by-and-by."

Whenever the sons of Gustavus
Labor and warble and cry,
Earning their bread by the sweat of their face,
You'll hear the "Swede by-and-by."

And the man who went out to hunt lodgings
For a month and a day had to try,
Till he lit on some rooms that just suited his wife,
"We'll go in this suite by-and-by."

In the theater, minstrel, cathedral,
In the church and the beer-garden nigh;
In the concert saloon and the circus,
They all sing the "Sweet by-and-by."

"WHISKY is your greatest oncmy," said a minister to Deacon Jones. "But," said Jones, "don't the Bible say, Mr. Preacher, that we are to love our enemies?" "Oh, yes, Deacon Jones; but it don't say we are to swallow them."

THE following notice is posted verbatim by a Frenchman in Peacham, Vt., as a warning to persons inclined to trespass on his premises:

One mans come on my place, fish;
One mans come on my place, trap;
One mans come on my place, hunt;
Ten dollars lose for him.

WHO ever saw a rope walk?—*Rome Sentinel.* Who ever saw a horse fly?—*Albany Argus.* Who ever saw a cat fish?—*Yonkers Gazette.* Who ever saw a tree toed?—*Hackensack Republican.* Who ever saw a milk made?—*P. I. Man.* Who ever saw a lamb chop?—*Baltimore Sun.* Whoever saw an onion peel, or a corn "crib," or an apple paring?

A COUPLE of young men were out fishing the other day, and on returning, were going past a farm-house, and felt hungry. They yelled to the farmer's daughters: "Girls, have you any buttermilk?" The reply was gently wafted back to their ears: "Yes; but we keep it for our own calves." The boys calculated that they had business away—and they went.

Two sweet little girls sat upon the sidewalk in front of the Elko post-office, one of them nursing a large wax doll. Her companion asked in tones of deep earnestness, "Does 'oo have much twouble wif 'oo baby?" "Oh, doodness, yes!" was the reply. "She cwies mos' all 'e time. She jes cwied and cwied ever since she was born. I'm jes' discouraged, an' I don't fink I'll ever born any more."

THE only true matches are made by love, and when two people have really loved from the depth of their very hearts—nothing can ever part them again.—Yonkers Gazette. How beautiful! how tender! And yet there are hearts that the world in vain has tried; hearts that have beat as only one heart can thump; hearts that the same ice-cream spoon, as it were, has fed; hearts that have parted forever, because one of the twain didn't appreciate cold meat.—Com'l Adv.

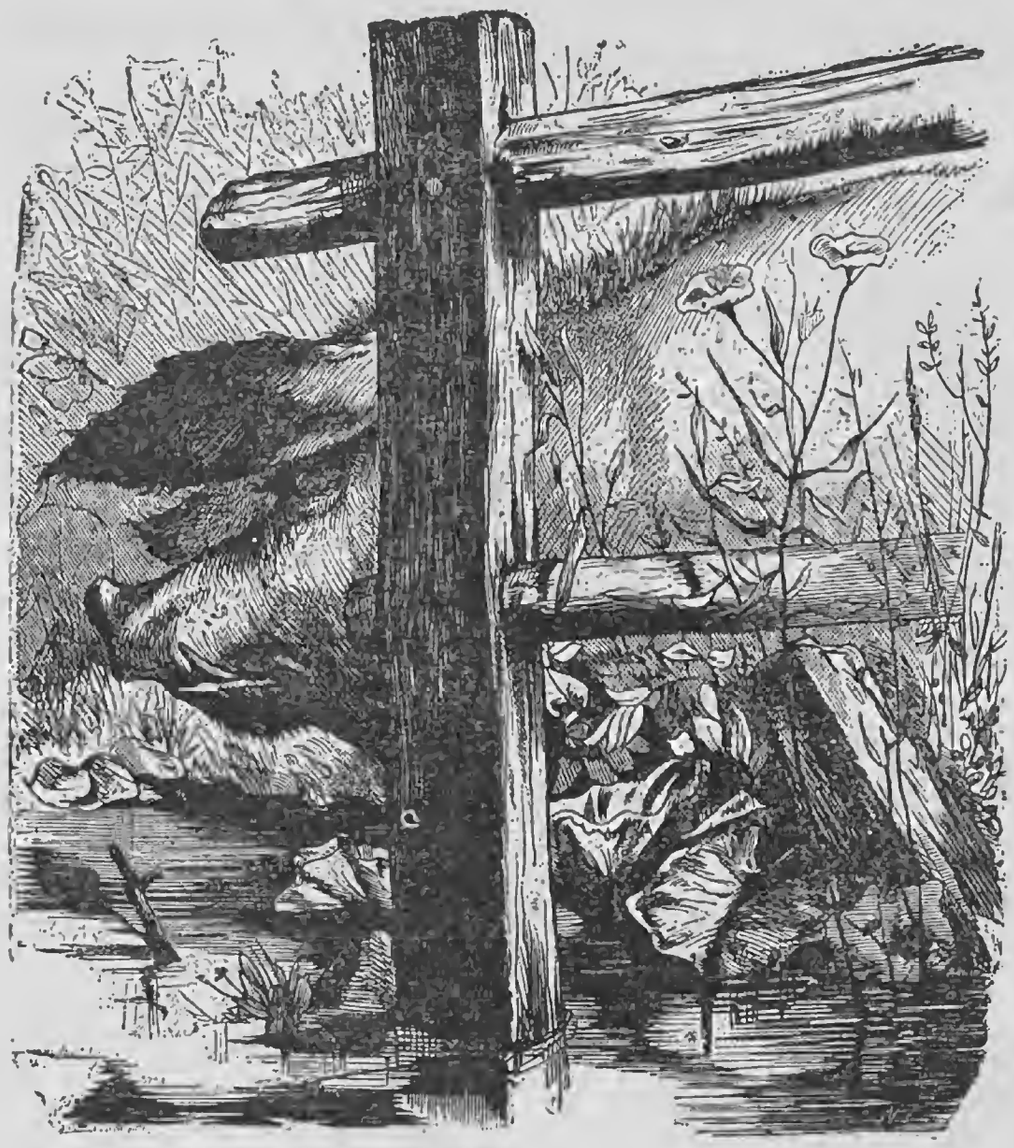
THE following dialogue is reported as having taken place between a game-keeper and a patient looking through the iron gate of a French lunatic asylum: Patient—That 's a fine horse. What 's it worth? Keeper—Five hundred dollars. Patient—And what did that gun cost? Keeper—One hundred dollars. Patient—And those dogs? Keeper—Eighty dollars, I believe. Patient—What have you got in that game bag? Keeper—A woodcock. Patient—Well, now, you had better hurry on, for if our governor catches a man who has spent $680 to get a woodcock worth thirty cents, he 'll have him under lock and key in no time, I tell you.

Blindly Groping

For some medicinal alcoholic resuscitant of physical energy which should take the place of the heady and frequently adulterated stimulants of commerce, the medical practitioners of a quarter of a century ago were electrified on first observing the reviving effects upon the system of a tonic then recently introduced, but which has since become the most popular medicine sold on this continent, viz., Hostetter's Stomach Bitters. Their astonishment and admiration were increased when experience further disclosed that this botanic remedy effected results which the mineral drugs of the pharmacopœia often utterly failed to produce,—among others, the permanent restoration of vigor, the removal of digestive, secretive and evacuative irregularities, and the eradication and provention of periodic fevers. Speedy recognition of the merits of the Bitters by unprejudiced and enlightened physicians naturally followed this revelation of medical facts, which have since received such frequent and positive confirmation.

TEAS This is a combination of capitalists to supply *consumers only* throughout the *United States* with PURE TEAS on the mutual principle, by getting up clubs. Send for New Price-List.

CONSUMERS' IMPORTING TEA CO.,
P.O. Box 5509. No. 8 Church St., New York City



TEMPERAMENTS.—No. 1. Phlegmatic.

KINGSFORD'S
Oswego Starch!

Is the BEST and MOST ECONOMICAL in the World.

Is perfectly PURE—free from acids and other foreign substances that injure Linen.

Is STRONGER than any other—requiring much less quantity in using.

Is UNIFORM—stiffens and finishes work always the same.

SOME OF ITS PECULIAR ADVANTAGES:

1st. That each tray receives immediately upon its entrance into the machine, the direct and greatest heat.
2d. That each subsequently inserted tray removes the preceding one into a lower temperature, out of danger.
3d. That it is thus almost impossible to burn the fruit during its process of evaporation.
4th. That the currents of dry, hot air, automatically created through its inclined flue are strong, and swift enough to make a toy wind wheel spin when held at the rear end, thus precluding the possibility of straining, cooking and discoloring the fruit. This accounts for the fancy work it does.
5th. That its evaporating capacity per square foot of surface is unequaled.
6th. That with it the individual farmer and orchardist can speedily, cheaply and conveniently convert his surplus or unmarketable fruits, &c., into a product, which will equal in appearance and value that produced by the costly commercial evaporators.
7th. That it is the only original inclined flue machine. Thoroughly protected by letters patent, and the only one which can guarantee protection and safety in its use against costly litigation or royalties.
8th. That it is the only portable evaporator, the manufacturers of which offer a market for their patron's product.
9th. That owing to the quality, appearance and market value of its products, it is the only cheap machine.
10th. That no farm implement will pay its cost as many times in a season as it will.
11th. That owing to the universal practice of sun and oven drying of fruits, the market for that kind is overstocked and does not pay, while evaporated fruit pays well.
12th. That it embraces more philosophical, correctly-applied science and peculiar advantages than can be enumerated in twelve points. Send for Catalogue and judge for yourself.

BIG GIANT CORN MILL.

Every Man His Own Miller.

The only Mill that will grind Corn with Shuck on without extra expense. The only Mill grinding Corn and Cob successfully that will grind Shelled Corn fine enough for family use.

Grinds twice as fast as any other Mill of same size and price. Manufactured by

NOTES FROM THE RURAL GROUNDS.

July 10.

THE Willow of which we have to speak, is one very little known as an ornamental tree in this country. And because it is well worthy of being known, we propose to distribute cuttings of it among our readers. To assist them in determining whether it is worth the trouble of sending for cuttings or not, we give a somewhat descriptive article which we contributed to the London Garden and which was published by that Journal July 28, 1877.

SALIX LAURIFOLIA?

"In several of our nurserymen's catalogues is mentioned a tree which they call Salix laurifolia. The specific name is not authorized, and I have not found it even as a synonym in any works to which I have had access. S. pentandra is the nearest, from which, in several respects, it is yet notably different. Be this as it may, the tree, though but a Willow, is such a gem among Willows, that one admires it without charging upon it the blemishes of its family. I have been educated to a full appreciation of this medium-sized tree by slow degrees. No other in our grounds has excited from visitors the same amount of praise; in truth it at first annoyed me, that friends would pass by costly novelties, with polite expressions of approval, to pour out upon this words of real admiration; and so at length it happened that I saw this tree not as a Willow at all, with a malarial atmosphere of swamps about it, but as one of remarkable beauty, none the worse for its lowly connections.

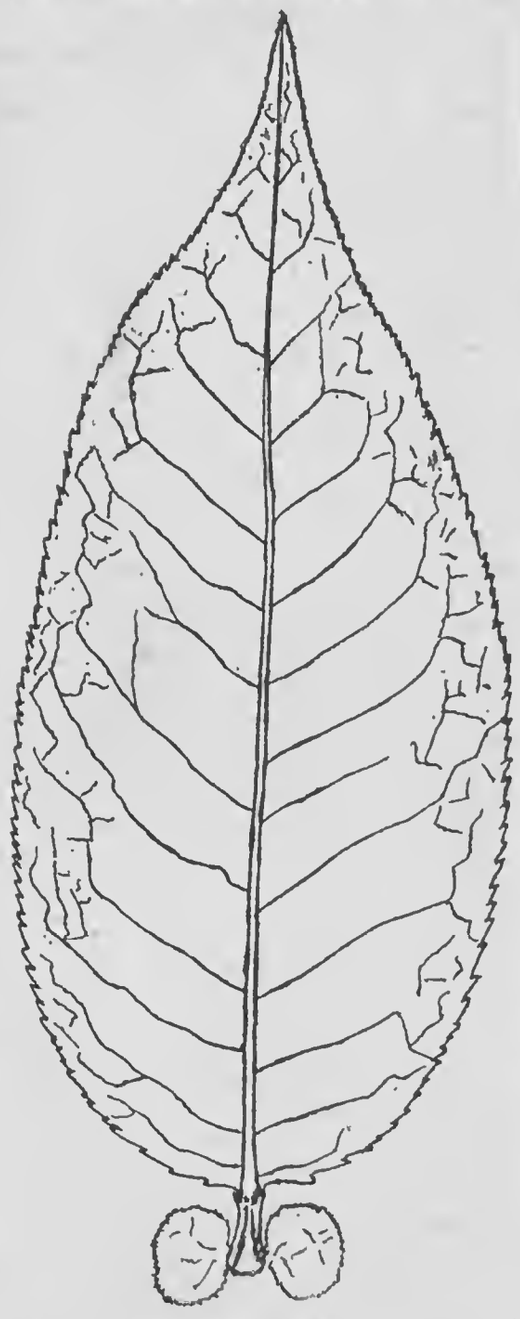
That it should be one of the first to unfold its leaves in the spring, and one of the last to lose them in the autumn, is a characteristic of Willows generally, though possessed by this species in an unusual degree; while that it should thrive in extremely dry situations, as well as in those of medium and excessive moisture is, as far as I am aware, peculiar to this species. We have one specimen growing beside a lake, upon a bank less than one foot above its level, so that its roots are perpetually in the water. Another specimen is placed in a situation that is neither dry nor moist; another grows upon high, dry ground, within three feet of a wing of our dwelling, and still another in a situation so sandy and dry, that we have been obliged, after repeated failures with other plants, to use such salamanders as Pines, Locusts, Privets, Matrimony Vines (Lycium barbarum), and the like, to secure something of an ornamental appearance to this half-arid belt.

Between the above specimens—growing in soils and situations so widely different—there is little difference in growth or thrift, and this little is in favor of the specimen growing near the dwelling.

The Weeping Willow (S. Babylonica) is in England a far handsomer tree than it is with us—at least in the Middle and Northern States. It is not quite hardy in this climate (New York)—not perhaps owing to the severity and extremes of weather alone, but because it is often weakened by various insects or their larvæ, that infest and sometimes girdle the stem. Thus, if not killed outright, it is often so injured by the frosts of winter as to present anything but a pleasing appearance the following summer. Hence we seldom see it in its full size and beauty; besides, it is not, like the S. laurifolia, at home in sandy, dry situations. In view of this, as also of the fact that I have never known the stems of S. laurifolia to be injured by insects, I attempted last summer to bud the one upon the other. The bud of S. laurifolia upon the S. Babylonica lived, and is now growing vigorously; the bud of the S. Babylonica upon the S. laurifolia perished. Doubtless, however, the rule would work both ways, and thus the insect and drought-resisting S. laurifolia could be made the stock of the Weeping Willow, which cannot so well endure drought, and is so often at the mercy of insect depredations.

As to the identity of S. laurifolia and S. pentandra, the leaves of the former are longer averaging at this time (June 27) 4 in.; they are also more finely crenate, more acuminate, and provided with reniform stipules. The tree is of more rapid growth, and attains to a somewhat greater hight than S. pentandra, which, according to London, is from 18 ft. to 20 ft. S. Meyeriana, which Linnæus calls S pentandra, more nearly corresponds with the form and size of the leaf, but the branches cannot be called "brownish," and the stipules do not "soon fall off." One of our oldest nurserymen, Mr. S. B. PARSONS, imported it from Angers in 1860, under the name of S. laurifolia, which, had it been either S. pentandra or S. Meyeriana, would have been quite unnecessary.

In the above respects there may be a difference between the male and female trees. I speak only of the female, never having seen any other; but of it I may say with enthusiasm that, on account of its incomparably glossy leaves that reflect the slightest light, its tall, smooth branches that sway in the wind as if they would surely be torn into shreds, and, withal, its elasticity, freshness, and shapeliness, it is worthy to fill not only those out-of-the-way places which are deemed unworthy of the finer plants, but of an imposing position upon the lawn, where, by the free use of the pruning-knife, it may be made to assume a round, spreading head, or, if



LEAF AND STIPULES OF SALIX LAURIFOLIA. (?)

left to itself, a fastigiate form, more glossy than, and as darkly green as, Magnolia grandiflora, and as compact and symmetrical as need be desired.

I should be glad if you could determine the name of this Willow." * * *

River Edge, Bergen Co., N. J.

[The Willow leaf which the editor of the RURAL NEW-YORKER has sent is, according to Mr. Gordon, that of Salix lucida of Michaux, and Salix Forbesi of Sweet's "Hortus Britannicus" for 1830.—EDS. GARDEN.]

Respecting the species we have only to add there are very decided points of difference between this tree and S. lucida as we have seen it in several nurseries. It has more ovate leaves, (see cut), they are more abruptly acuminate, the upper surface is darker the entire leaf heavier; the petioles shorter — the stipules more kidney and less heart-shaped. However, while we must accept the decision of an authority so trustworthy, we may be permitted to believe that it so differs from the species as to be entitled to a variety name.

Such as it is, however, we are happy to be able to say that we are prepared to send cuttings to any of our subscribers upon the receipt of a two-cent stamp for postage. The cuttings will grow with scarcely a failure, if placed in earth where they are to remain and be kept moderately moist for a week or so.

PLEASE OBSERVE.

For reasons which will occur to our friends, we are obliged to limit this offer as to time. We cannot fill any applications received after August 3d.

Farm Economy.

DRAINAGE.

R. C. CARPENTER.

LEVELING.

THE survey already described relates only to the location of drains, but there is another branch of surveying more intimately connected with their construction, and absolutely necessary in some cases. I refer to the branch called leveling, which gives us a knowledge of the rise or fall so essential to the proper construction of the drain. Leveling can be done in various ways, but whatever way it is done, the principle always remains the same. To perform leveling, you must secure a horizontal line of sight, then having a rod graduated into feet and fractions of a foot, hold it up, and sighting across the line of sight, see how far from the foot the line of sight intersects the rod. Call this distance a rod reading. Move the rod to a second point, and keeping the line of sight horizontal, repeat the process, the difference between the two rod readings will be the difference of level. It is to be noticed that we have no information of the point above which our instrument stands, but simply of the points occupied by our rod. This horizontal line of sight may be secured by many devices. The first to which I shall call your attention is the Wye level, in which the line of sight passes through a telescope, which is parallel to a spirit-level attached underneath. This is the most perfect of all leveling instruments, is easily adjusted and easily managed. The cost, however, is so great as to preclude an extensive use of it. But there is an instrument sufficiently accurate for all ordinary purposes of leveling for underdrains, and with a price sufficiently low to place it within the reach of all. I refer to Sibley's level.

DESCRIPTION AND DIRECTIONS FOR USE.*

The level is made of iron, and consequently is not liable to warp and change like the wooden level. The sight marked A is made of brass, with an adjustable ring, in which are set cross wires, the intersection of which is at equal distance from the bottom of the level with the pin-hole brass sight B. In the center of the table, on which the instrument sits, is a hollow pivot fitting a hole in the center of the instrument, on which it revolves. On the board is marked any angle desired, a plumb-line passes through the pivot and falls over the starting point. Place the line seen in the engraving on the end of the sight and the line marked on the table together, and place them on a line with the given line of which the plumb-line marks the center; place the level on that line, and then turn the instrument to any angle marked on the table, and all points on that line are at a given angle with the given line. For example, a mason or carpenter has to stake out the foundations of a building: drive a corner stake, let the plumb-line fall over it, and place the instrument and table as before explained; and, after getting the levels on the given lines, turn the instrument to an angle of ninety degrees marked on the table, and all points on that line are at a right angle with the given line. You have your foundations, square and level. To use as a draining level, set up near the line of the drain, level the instrument, and the line A—B will be a level line, hold a staff divided into feet and inches, or feet and tenths of a foot, at the point you wish to find the level of. If the staff have its gradnations numbered from the bottom up, the point where the level line through A—B intersects it, will be the number of feet that the bottom of the staff is below the level line A—B. In the same way, setting the staff on another point, find how far that is below the line A—B. The difference between the hight of the line A—B from the bottom of the staff, in its two positions, is the difference of level of these two points.

The drain-level notes at the College are taken in the following manner: A projecting portion of the brick work of one of our buildings is taken as a reference point, and is assumed to be 100 feet high, although but two feet above the ground. The level is set in a convenient position so that its line of sight is above this point, a rod graduated into feet and decimals is next held on the point so that the feet are numbered from the bottom up. Where the line of sight intersects this rod is called a reading, for it shows the feet and fractions of a foot that the bottom of the rod is below the line of sight. This reading is called a + sight, for added to the hight of the point (technically called a bench), it gives the hight of the instrument.

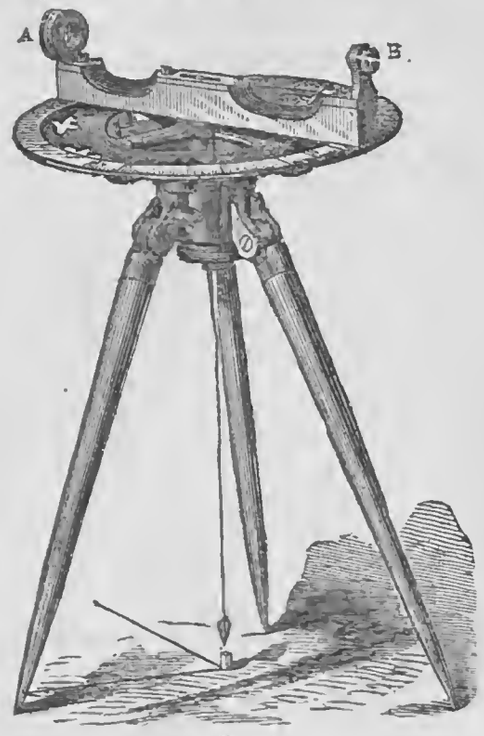


FIG. 1.

Now, if the instrument be kept level, and a rod held on any of the pegs, the reading on the rod will show the distance of the peg below the instrument, this we call a — sight, because, subtracted from the elevation of the instrument, it gives the elevation of the peg, which is the same as that of the ground.

The elevation of the outlet of the drain is next ascertained in the same manner to this elevation adding the rise per station, which is found by dividing the whole rise by the number of stations. We get the elevation of the bottom at the next station, proceeding in the same manner we find the elevation for the bottom of the ditch throughout. The depth at any point will then be found by taking the difference between the

* For the use of the cut of Sibley's Level we have to thank Mr. A. J. Bicknell of this city.

elevation of the peg and the elevation of the bottom. The depth is marked on the stake by the peg.

We give a portion of the field notes of a drain in field No. 2, to show the method in which they are kept:

NOTE.—Stations 1, 2 and 3 are in a muck marsh, from which most of the muck has been drawn out for composting purposes, and not replaced as yet with firm ground.

OTHER METHODS OF LEVELING.

The carpenter's spirit-level may be used by setting it on the horizontal arm of a boning rod which is in the exact line of a ditch. It is used in the manner already described, and for short distances gives quite accurate results. The square with a small 75-cent level attached to its horizontal arm, which is stuck through the slit in an upright stake on the exact line of the ditch, is nearly as good. With a plumb-bob and string hung over the vertical arm of a square suspended as before, approximate leveling can be done. Leveling that depends for accuracy on a plumb-bob will be liable to considerable variation, for the bob swings with all the ease of a pendulum, and the exact point where it is vertical cannot with accuracy be determined. If the plumb-bob is immersed in water it is somewhat more quiet, but even then it is liable to be moved by a breath of air.

A straight-edge, mounted on a table of some kind, can be approximately leveled by pouring on it some water and noticing which way it runs. If it runs equally in all directions it is about level. I say about, for it is a rough instrument, and you need not expect to do accurate work with it. There are a great many other devices for securing a horizontal line of sight, but all of them depend on the principles already enumerated, and we will not further consider them.

CONSTRUCTION OF A DRAIN.

Most of the points necessary for the successful working of a drain have already been noticed, and it remains only to briefly call attention to the construction of the drain itself. The first thing is the digging; this is done after laying out the center line of the ditch, by throwing out a trench from 18 to 30 inches wide. This trench is gradually narrowed as the bottom of the ditch is reached, until at that point it is but one spading wide. The best implement for most ditchers with which to do this work, is the ordinary spade; some spades made tapering especially for this work, are of little or no value, as it is very difficult to do clean work with them. Great care should be taken not to dig beneath the proposed bottom of the ditch at any point, as that will cause uneven settling of the bottom. To prevent this it is best to throw out at first no dirt nearer than six inches to the bottom, leaving the remainder in until nearly ready to lay the tiles.

The next step is to set a line above and parallel to the desired bottom of the ditch; this is done in a very simple manner by supporting the line at each end by two sticks fastened together with a bolt, and called shears, which can be raised or lowered by shoving the legs in or out.

The shears are shown in Fig 4, and are made of two strips of light wood about 7 feet long and 2½ to 3 inches wide, held together by a small carriage-bolt about six inches from the upper ends.

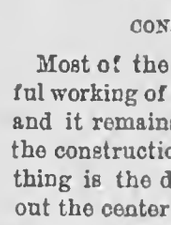

FIG. 4.

Two of these shears are placed astride of the ditch at a distance of 4 to 6 rods from each other. They are then adjusted to the proper hight by spreading or contracting the legs, at the same time keeping their point of intersection over the center of the ditch. At the same time, or before the shears are adjusted, a small and strong line is passed over them and wound once around one of the short arms of each set of shears to prevent slipping. The line is then fastened by connecting it with a peg driven into the ground somewhat farther from the shears than the hight of the line above the ground. To prevent the line from sagging, boning rods, as shown in Fig. 5, are used. These are made of a round rod of hard wood about seven feet long, and 1½ inch in diameter, to which is fastened a horizontal arm about two feet long, which is 2 by 2½ inches next the rod and made tapering for the sake of lightness. This is held in position by a wedge, as shown in Fig. 5.

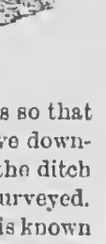

FIG. 5.

Fig. 6 shows the line, shears and boning rod in position. The line in our practice is set just 7 feet above and parallel to the desired line of the ditch. Each set of ditches at the College is provided with a staff just seven feet long and graduated into feet and tenths. To set the line,

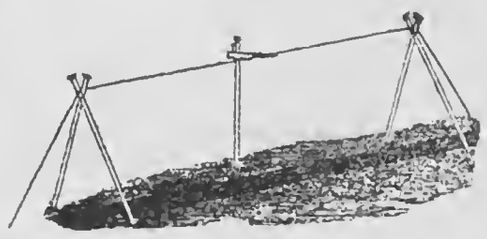

FIG. 6.

the staff is held bottom side up (that is so that the graduations are numbered from above downward) on the "peg" by the side of the ditch which was set when the ditch was surveyed. (The hight of this peg above the bottom is known and recorded on a stake by the side of it.) From the upper end of this staff take a distance equal to the depth of the ditch below the top of the peg, and it will give the proper position of the line. This you notice is the same as subtracting the depth of the ditch from seven feet.

After setting the line, you are then prepared to finish digging the ditch, the depth of which you can test from time to time by means of the line above it. The final cleaning of the ditch can best be done with a semi-cylindrical scoop, somewhat larger than the tile, mounted on a handle. This scoop leaves a round groove in the bottom very convenient to lay the tile in. There are several kinds of scoops in use by ditchers. The two in most common use are the "push scoop," shown in Fig. 7, and the "pull scoop," shown in Fig. 8. An improved form which combines the properties of both these scoops, was devised by Dr. Miles, and has been in use on the College farm a number of years. It is shown in Fig. 9, and was named by him the "College scoop." The position of the shank in the middle of the blade gives a balance to this scoop, that not only makes it easier to manage but makes it stronger. The blade of this scoop need not exceed twelve inches in length when used in connection with the line already described.

FIG. 7.

FIG. 8.

The bottom made by the scoop should be tested by measuring from the line, and if correct for three or four feet (the distance you can reach with a scoop) you are then prepared to commence laying your tile, the first tile should be carefully laid; then, in the groove left by the scoop, lay the second tile, turning it around until a good joint is secured, then if no collar, cut a piece of closely shaven turf about six inches long and four wide, and lay, grass side down, over the joint, tucking it fairly around with the fingers. If a collar is provided, no turf will be needed; the collar should be put for half its length over the first tile, and the second tile slipped into that. In heavy land no joint-covering is usually needed, the drains working perfectly well without it.

FIG. 9.

After the first two tiles are laid, they can be covered with about six inches of dirt, and you can stand upon them to lay the third without danger of displacement. In this way proceed until all the tiles are laid, measuring the distance of each tile from the string, to be sure that the correct grade is preserved.

It is not safe except in stiff land, where the ditch will remain clean, to lay the tile from the bank of the ditch, with an instrument made on purpose. Better work is usually done by getting in the ditch and laying them in the method described.

COST OF UNDERDRAINING.

The cost of underdraining depends upon so many considerations that it cannot be very accurately stated. It depends on the price of tile, character of the soil, grade of the drain, and various other circumstances which may arise. The cost of the tile at the brick-kiln at Lansing, Mich., is as follows: Two-inch tile, $11 per M., or 18 cents per rod; three-inch tile, $16 per M., or 24 cents per rod; four-inch tile, $26 per M., or 44 cents per rod; six-inch tile, $50 per M., or 84 cents per rod.

The Jackson Fire Clay Company of Jackson, Michigan, make an excellent vitrified tile of fire-clay, of unusual strength and excellence. These tiles being vitrified do not absorb water, and consequently are less liable to be affected by frost. Their prices for carload lots, delivered on the cars at Jackson, are as follows:

2-inch tile per 1,000 feet	$11 00
3-inch tile per 1,000 feet	17 00
4-inch tile per 1,000 feet	26 00
5-inch tile per 1,000 feet	36 00
6-inch tile per 1,000 feet	46 00
6-inch tile per 1,000 feet (each tile two ft. long).	50 00

It is commonly estimated that two-inch tile can be made with good living profit for $10 to $11 per thousand, and the rates should not in any portion of the State differ materially from those given above. The cost of digging is estimated by Waring to average for drains four feet deep, 29 cents per rod, and for laying and filling 7 cents, when labor can be had for $1 per day. The cost of preparing drains three feet deep is about two-thirds of the cost of those four feet deep. The cost can be considerably reduced by the use of the plow and the scraper; some say the cost can be reduced one-half, and I should always advise their use both for filling and digging. The cost per acre depends upon the distance apart; four-foot drains do good work four rods apart; this would require forty rods per acre: if three-inch tile be used, the total cost would be about 50 cents per rod, or $20 per acre. If but eight or ten rods be constructed per acre, as is usually the case, the cost would be reduced to $5.00.—[To be continued.

Field Crops.

ONE OF OUR BEST GRASSES.

An Experiment on a Disputed Point.

PROFESSOR W. J. BEAL.

QUITE often we hear the question discussed, "Which is the best breed of horses, cattle, sheep, or swine." Before answering this, the best informed men ask the pertinent question, "What do you want them for?"

A similar rule applies to grasses in cultivation. Some are best for one soil or purpose and some for another. On the richest pasture lands of Kentucky, they boast of Blue-grass as the best the world affords. The rapid growth, good quality, and bountiful yield of this grass have rendered certain counties of Kentucky famous throughout the Northern States, and even in Great Britain.

The writer has heard of some instances of farmers in the Northern States who have sent to the South to procure seed of this famous grass. They have been disappointed. For many years the botanists have been telling the farmers that the plant which is known as "Blue-grass" in Kentucky is generally known at the North as "June-grass, Green-grass, or Spear-grass." The writer has, through the press and public lectures, probably answered this question ten times or more a year for the last ten years, and during the last few years oftener than ever before. Are they the same? There is nothing like giving the matter a practical test.

Two years ago, I sent to a reliable friend in Louisville and had him procure a small sample of what is there known as "Blue-grass." He procured two samples of two different seedsmen who knew where the seed was raised. I planted these in two small beds among my grass-plots. Between them I planted seeds of June-grass, which I selected myself from the hay which had been cut on the farm of this place. They were sown at the same time, on soils to all appearances alike. The three plots came up alike, grew alike, and blossomed together. A careful examination showed as great a variation in size and color of the stalks in one plat as in the other. Every one who saw them, farmer, student, and botanist, pronounced them identical. This grass is Poa pratensis. A great many farmers and writers confound this grass with another called Poa compressa. The latter has a flattened stem, flowers a month later, has a smaller head and shorter leaves. It does not run and spread all over, as is the case with June-grass. The stems of Poa compressa remain green for a long time after the plant goes to seed. The stalks are a dark bluish-green, well meriting the name "Blue-grass," by which it is usually known at the North. The latter runs the scythe badly when it is mowed. It usually looks rather thin, but yields a great weight according to its bulk. I do not include this Poa compressa among the grasses recommended for pasture or meadow, unless it thrives unusually well.

Some of our raisers of stock have visited Kentucky and have read the papers. They are beginning to talk of "Blue-grass" in the manner of Southern people. Others call it "Kentucky Blue-grass." This makes the confusion still greater. I wish our Southern friends, many years ago I presume, had never applied the term "Blue-grass" to Poa pratensis. The grass is certainly not as blue as Poa compressa. Some may think it useless to write so much on this point, but there are many who want to know the truth about the matter.

In Michigan, June-grass flowers only once a year, about the first days of June. The stalks are usually fine and short and make but a little hay to the acre, though this, if cut in season and well cured, is very sweet and nutritious for horses and cattle. This grass usually runs out clover and timothy in about two years. It is a great pest in cornfields, especially if the land is low, rich and not well drained. The grass is very hardy, starts early in spring and grows all summer till cold weather. It is too often judged by its single growth of short stems, while its chief value consists in the continued growth of its leaves. For permanent pastures, even on low or mucky or bottom land, I know of no better grass. When it once gets started it spreads with great rapidity, much like Quack-grass. It is well supplied with underground stems, which are erroneously called roots.

This is our most valuable grass for lawns, at least in nearly all places. If cut often and sown on rich ground, it makes a soft, thick, green turf which is a delight to the eye and to the feet which tread upon it. Poa pratensis is one of the most common, and ranks among the best grasses of the United States.

Agricultural College, Lansing, Mich.

The Herdsman.

ANIMAL FOOD AND ANIMAL PRODUCE.

L. A. R., writing to the RURAL, says:

"There was once a man thin and spare, of whom his neighbors said he eat so much it made him poor to carry it around.—I was reminded of this when reading in the leader of this week's RURAL that it is those animals which have the capacity to eat, digest and transform the greatest quantity of food which are the *most profitable*. Now, I should make objection to this rule of selection unless you can make it appear that "transform" is a saving word. Certain breeds of cows are known to be gross feeders, while others will thrive on much less percentage; so with horses—and we do not find in cows the greatest eaters to give the most or richest milk, or in horses that those which consume the most food are, as a class, better workers or drivers—at least so far as my observation goes—can that position be sustained?"

ANS.—If our friend owned a mill and manufactured flour, for which he received a certain advance on the cost of the wheat used, he would have no trouble in understanding that a certain number of bushels must be ground each day to pay the miller and to cover the interest on the investment; and that if he made a profit, his mill must have a capacity beyond this number of bushels; and finally, that his profit must be in proportion to this extra capacity.

The same principle holds good when we come to manufacture butter or cheese or wool, beef or mutton or pork—the animal must be supported and the interest on its cost covered before we get any profit; consequently, the animal which has the capacity to manufacture the most raw material into finished products, must, of necessity, be the most profitable. The case is generally more complicated than this, however—it may be, that if we attempt to screen more wheat, a certain proportion will be lost with the screenings, a certain proportion may be spoiled by grinding too rapidly, or a part of the flour may be carried into the bran by overtasking our bolter. And so with animals—if they are fed more than they will eat, a part will find its way into the litter and be lost—screenings; if they eat more than they can digest, another part will fail to be made into proper material for assimilation and pass off with the excrements—too rapid grinding—or if they assimilate more than the cells which secrete the milk, fat or wool can use, this extra amount will be lost as a waste product—overcharged bolter. It may be said that we need not feed our animals beyond their capacity and then this loss will not occur; very well, we may also say it of the manufacturer of flour, but unless he grinds a certain number of bushels per day he *cannot expect* a profit. The miller, however, will be quick to see what was wanting and replace his insufficient machinery with that of greater capacity—why not the farmer as well?

It would seem that our friend has lost sight of the fact that every animal's product is the result of the transformation of the food, and if no waste occurred a certain amount of food should invariably produce a certain return, whether this consists of muscular power, fat, milk or wool; but wastes do occur in the different ways we have mentioned, and in still others which we have not space to consider, and the most profitable animal, like the most profitable machine of any kind, is the one that can use the most raw material with the smallest proportion of waste. It may be that the farmer cannot discover just how the waste occurs, but he certainly can ascertain, by the method pointed out in our editorial of July 6th, which animal uses its food in the most economical manner.

Now, these are general principles applicable to manufactures of all kinds—they are incontro-

vertible and self-evident; but we have some special problems offered for solution, to which, from the importance of the subject, we will give special consideration. In our editorial, we used the words, eat, digest and transform, and each of these was necessary to convey our whole meaning; we will now attempt to explain what was meant by the word transform. The milk given by a cow, the muscular force produced by a horse or ox, the wool grown on a sheep, the fat secreted by certain tissues in an animal, are *above all* dependent on the constitution and activity of the individual cells which make up the organ that gives us these products in the different cases; and this constitution and activity of the cells are partly inherited, and partly acquired by the conditions under which the animal lives from birth to a given time. No matter how much food is eaten and digested by a half-wild Texan cow, no matter what care she receives, she will not be a large milker on this account; neither can a precocious Short-Horn steer hold his own if worked by the side of oxen of some other breeds; nor yet will a long-nosed native hog lay on fat like an improved Berkshire though otherwise under the same conditions. The same amount may be eaten and digested, but the cells of the udder, of the muscles or the fat secreting tissues have not the capacity to use it—it is burnt up in the system and leaves it as waste products. But this does not affect our position—if we had simply said the more an animal eats the more profitable it is, this would have been an imperfect statement; or if we had stopped by saying the more an animal eats and digests, we would still be short of the truth; but we intended to include all of these processes and we believe our position is impregnable.

A certain amount of heat is necessary to sustain the body at a proper temperature, to warm the food and drink, to keep up the circulation, the digestive and nutritive processes; and a certain amount of nutritive elements must be destroyed to supply this heat and force, and it is a physical impossibility for it to be supplied by less; again, one part of fat may be manufactured from 2.44 parts of starch or 1.94 parts of albuminoids, and it is a chemical impossibility for it to be produced by less; so that when a cow digests all that she eats, when her udder has the capacity to use all that remains after the wants of the body are supplied, and when these wants remain constant, an increased quantity of food eaten should invariably produce a corresponding increase in the nutritive elements of the milk. It is evident, however, that the same conditions are not always present, and, consequently, the milk does not always bear a definite relation to the food, and for similar reasons the capacity for work or producing fat may not always correspond with the quantity of food taken. The post-horses of Paris, however, have a nearly constant weight to draw; they are fed on a ration of support, and, in addition, 400 grams of oats for every kilometre traveled; that is, their feed is exactly in proportion to their work; it has been determined by long experience, and it is found when they do not receive this amount they use up their own flesh and very soon become unfit for work. And so with any other animal, the produce which it supplies is manufactured from the food, and, within certain limits, bears a constant relation to it, but the amount of food which it can use profitably depends upon the capacity of its internal machinery; consequently, we repeat, "*it is those animals which have the capacity to eat, digest and transform the greatest quantity of food, which are the most profitable.*"

PRIZE CATTLE AT THE OXFORD SHOW.

The "Bath and West of England" Society held its annual Agricultural and Horticultural show this year the first week in June at Oxford, the Oxfordshire Agricultural Society co-operating. It is universally admitted to have been one of the most interesting and valuable shows ever held in England, which, considering that the exposition of Live Stock at Paris occurred at the same time, is noticeable.

We re-produce, from the Agricultural Gazette, three photographs of those animals most likely to interest American farmers: first the Herefordshire Bull, three years old, winner of the first prize in the Old Bull Class, and declared by the judges to be the best male animal on the grounds, even superior to the superb and famous Short-Horn bull "Sir ARTHUR INGRAM" owned by Mr. W. LINTON, Sheriff of Hutton, York. The owner of the Hereford is Mr. A. ROGERS, The Rodd, Kington, Herefordshire. The photograph is copied with the free pen of a real artist and is no doubt a faithful likeness of the sleek and sleepy original. One of DANIEL WEBSTER'S clients, commenting to him about the opposing counsel, said: "He is a sleepy-looking old fellow." "Ah" said Mr. WEBSTER, "if Judge So-and-So is asleep, don't let anything wake him up." We feel a good deal so about a sleepy bull of those proportions.

In his anxiety to show the breadth of breast and depth of brisket, the photographer foreshortened the animal a good deal, so that we lose the great length characteristic of the breed. It is nevertheless a strikingly real picture.

Next Mr. SIMPSON'S Jersey cow "Luna" which won first in the class of cows three years old or over in milk or in calf. She is said to be a grand cow and a splendid milker. Mr. SIMPSON'S herd at Wray Park, Reigate, Surrey, is one of the best in England. He is very careful as a breeder, a close student of pedigrees, and quick to secure at any cost whatever may improve his herd. He breeds from solid-colored animals, gray or blue or inclining strongly to these colors, and when the herd was

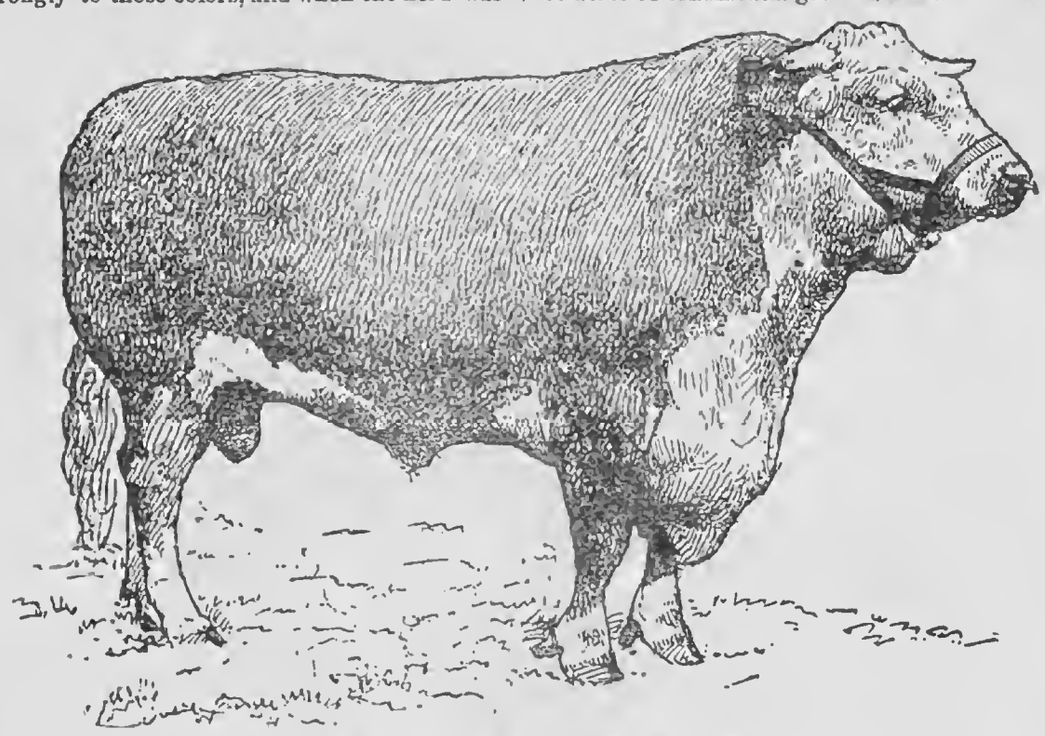
GARDEN TALKS AND WALKS.

THE BEECHES, Mass., July 6, 1876.

MR. HUNNEWELL'S RHODODENDRONS.

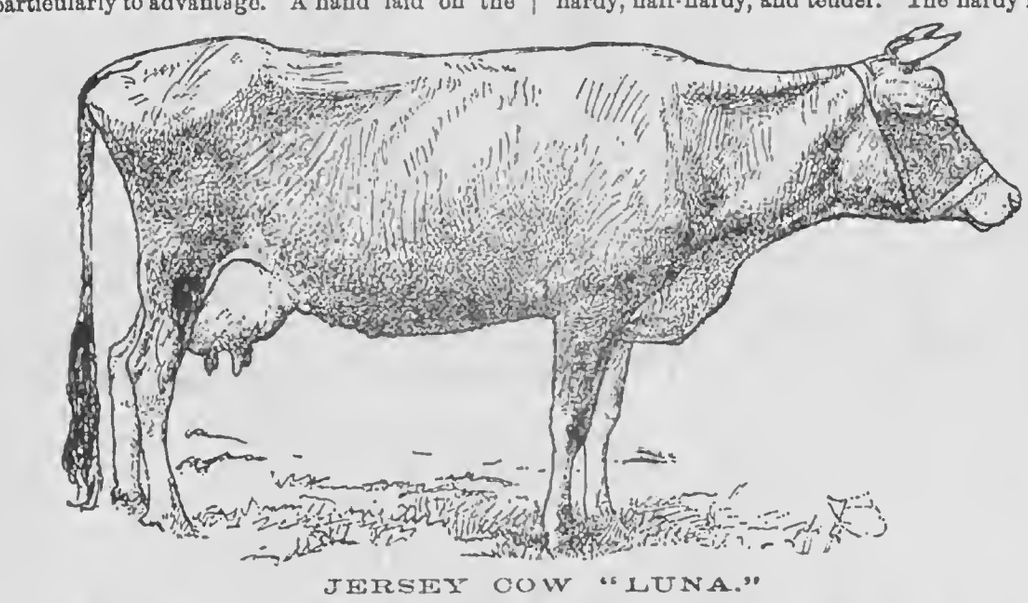
Mr. H.'s garden at Wellesley comprises some 50 acres of ornamental ground, and is one of the



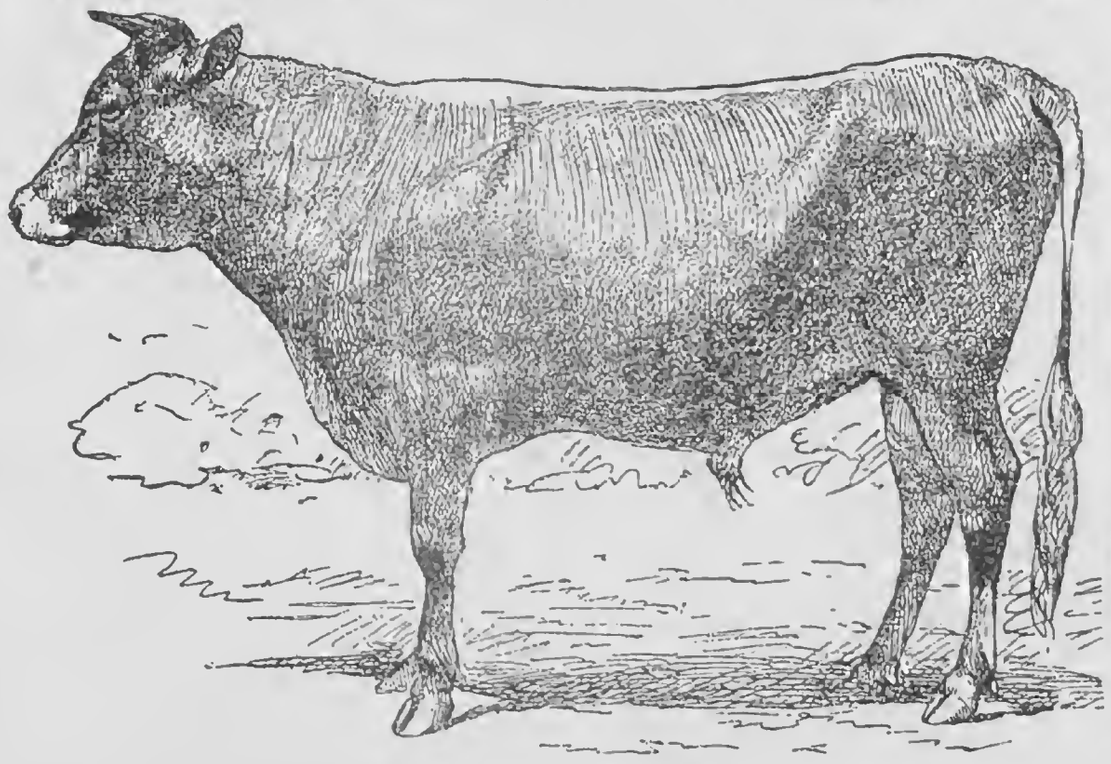
HEREFORDSHIRE BULL.

visited by the writer he would have no others in it; nevertheless he was realizing a great amount of milk of the richest quality, which makes it plain that the possession in the highest degree of fancy points by an entire herd is not incompatible with great excellence, perhaps the very greatest excellence as butter producers. The picture is not a handsome one, but it without doubt represents a very handsome and excellent cow. Her pose is bad, not showing the hind quarters particularly to advantage. A hand laid on the back would have corrected the apparent droop of the rump, and neither this nor the picture of "Gipsy Lad" is so skillfully drawn as is that of the Hereford.

The third picture "Gipsy Lad" is another of Mr. SIMPSON'S breeding, though shown by Mr. H. A. RIGG of Walton-on-Thames. This year he is highly commended, while last year he won the first honors of this Society, 3rd. at Liverpool and H. C. at Banbury, evidently an excellent two-year-old and quite likely with a pedigree containing the names of more prize-winners than any Jersey animal in America can show, and yet he and his progeny are no doubt excluded from American herds, or from those whose proprietors wish their stock entered in the Herd Register of the American Jersey Cattle Club, because the pedigree runs back beyond the time for which the most accurate documentary evidence has existed.



JERSEY COW "LUNA."



BULL "GIPSY LAD."

most princely establishments of its kind in our Union. Most kinds of gardening are well represented, but Rhododendrons, Azaleas, and hardy conifers are objective points. A public exhibition is made of the Rhododendrons when they are in full bloom, which is usually from the last week in May till the second week in June; and a more gorgeous and profuse display can hardly be imagined.

The Rhododendrons are of three kinds, viz.: hardy, half-hardy, and tender. The hardy kinds occupy beds and sheltered banks and borders in immense masses through the grounds. The soil is a light loam on a gravelly bottom. The beds for the plants have been well prepared by deep working and liberal enriching with peat and leaf-soil. Before winter sets in, the ground is heavily mulched with leaves, which are permitted to stay during the summer time, and thus decompose, and enrich the earth. During the summer months, for tidiness' sake, the rougher part of the mulching is pushed back from the front of the beds. I noticed a deep trench along the back of some of the larger beds, and was informed by Mr. Harris, the gardener, that it is to prevent encroachment of the roots of the neighboring trees to feed on the compost prepared for the shrubs. Mr. Harris does not think that the cases of failure, so often experienced, are due to cold, but instead, to drought and the consequences resulting from exposure to mid-day sun. In order to grow them successfully, he advises a sheltered location, partial shade from noon-day sun, deeply-prepared soil liberally mixed with peat, leaf-mold, and sand, a heavy mulching of leaves in winter to lighten the severity of hard frosts, and the mulching to remain during the summer time, to assist in keeping the soil moist and cool. Peat, however, is not absolutely necessary, but a location where water will not lodge in pools in the winter time is imperative. These hardy sorts are mostly varieties and crosses of R. Catawbiense, a species indigenous to the high Alleghanies, from Virginia southwards. Some of the finest hardy Rhododendrons are; giganteum, bright rose; atrosanguineum, deep red; Everestianum, rosy lilac; Caractacus, deep purplish crimson; grandiflorum, rosy crimson; Blandyanum, bright cherry; delicatissimum, white to blush; album elegans, blush to white; Glennyanum, blush; and Lee's, purple.

The members of the half-hardy section are very beautiful and many of them brilliantly colored. They are a progeny (hybrids, crosses and varieties) mostly obtained from R. Catawbiense and Ponticum, hybridized with the more glowingly-colored Asiatic species, notably R. arboreum of the Himalayan Mountains, and which is a noble scarlet-flowering kind. Before winter sets in Mr. H. lifts these half-hardy sorts with their roots as intact as possible, and heels them in in light soil in a cellar, pit, or shed, there to remain till the following spring, when they are again transplanted to their summer quarters out-of-doors. All the light and ventilation practicable are admitted during the winter months, of course, regulating the amount of ventilation by the state of the weather. Instead of the plants objecting to this mode of treatment, they seem to like it, and grow freely, blossom lavishly, and make a proportionate annual increase of roots. A few of the best of them are: Purity, white; The Queen, blush to white; Helen Waterer, rose with white center, a most lovely sort and now only one among many of like marking; Scipio, rose; Stella, pale rose; Lady Armstrong, pale rose; concessum, pink; Crown Prince, bright rose; H. W. Sargent, crimson; Mrs. Milner, crimson; James Bateman, rosy scarlet; Prince Albert, rich lake; and Joseph Whitworth, rich lake, considered by Mr. Harris the finest dark-blooming Rhododendron in their collection.

The tender sorts are grown in pots and treated as green-house plants. They are mostly species from the mountains of India, but now, too, we have many beautiful garden-raised sorts among them. They all have beautiful flowers, and several of them, exceptionally handsome leaves. Just now they are in a shady, cool green-house, in which the temperature is even and the atmosphere moist, and when they shall have completed their growth, they will be transferred out-of-doors to ripen their wood. Rhododendron Edgeworthi, arborenm, Dalhousiæ (naturally an epiphyte), campanulatum, Princess Alice, and the like, represent this group. RENOCLAF.

KISSENA NOTES.

UNUSUAL GROWTH.

IT is an oft-noted fact that the amount of growth produced during different years varies widely. Conditions of heat, moisture, etc., retard or advance the development of tissues. Old Oaks, sawed down, indicate their best years of growth by annual rings which, in some cases, will be much broader than in others, proving that the increase has been greater during some particular years. The present season has been thus far remarkable for the unusual growth made by both trees and shrubs. In many cases, the increase is a third greater than is generally attained. It is pleasant, undoubtedly, to contemplate such abounding vigor, but we must pause before giving way to exultant feeling. Growth made during such copious rains must be necessarily succulent, and not consolidated as it would have been during drier weather. Should we have frequent rains during the remainder of summer, a hard succeeding winter may teach us to rue what appears to us now a decided advantage. Even a drought may prove a blessing in disguise. The experience of a recent Horticultural Exhibition of deciduous trees in Gilmore's Garden, N. Y. City, will exemplify the correctness of our inferences. Plants, taken up and either balled with moss, or potted, during a pouring rain, and carted 10 miles under the same conditions, failed to retain the freshness of similar trees exhibited last year in the same place. Last year, however, the week preceding the exhibition, was very dry, a fact which is quite significant. Japanese Maples have been accused of defective hardiness during the extreme heat of midsummer. It is therefore interesting to note that under the burning suns of the present July days, they neither scald, nor burn, nor shrivel up. Much of the fault that has been found with them has grown out of their behavior the year succeeding their importation from Japan. Transplanting also checks a plant under any circumstances, and renders it less able to resist hardships during the year immediately following.

NONE BETTER.

What a grand Clematis Jackmanni is! A specimen of large size, just before me as I write,

shows such masses of flowers that its surface is literally covered. Its color is rich, and size large. There are indeed larger and more exquisite Clematises, but none blooms better or grows more vigorously, or, in a word, is better suited for general employment.

A PRETTY SPIRÆA.

The pretty dwarf Spiræa crispifolia, introduced by Mr. THOS. HOGG, and certainly very novel, is just now in bloom. Its entire surface is covered with pretty pink flowers that will come a second time during the latter part of summer and early fall. It looks and acts very like Spiræa callosa in many ways. This habit of late blooming renders it valuable for completing the succession of bloom at a season when flowers are scarce. The landscape gardener will also find its round, dwarf form useful in shading off the outskirts of a group of shrubs. As it grows older, it becomes more spherical and compact.

THE GOLDEN YEW,

so long and justly celebrated, is especially beautiful during June. There is a softness and brilliancy about its gold, that is very charming. Unlike the Golden Retinospora, this fine coloring changes to a greener hue during the maturity of late summer and fall. No tree can be trained into artificial shapes more perfectly than the Golden Yew. I can recall now a compact group of three specimens so pruned that the imagination might readily conceive them as representing the identical quadruped that wore the Golden Fleece. And yet I question whether the Golden Yew is ever more graceful and attractive than when it has been pruned just enough to simply develop the natural curves of its true character.

SIBERIAN ARBOR-VITÆ.

The custom of using Siberian Arbor-Vitæs in quantities for surrounding the lots in cemeteries seems to have fallen into disfavor. People are coming generally to recognize the superior attractions of a park-like cemetery. It would be a pity, however, to neglect the Siberian Arbor-Vitæ, for although its shape is somewhat too formal and definite for a hedge, yet it is, after all, the hardiest and most richly colored Arbor-Vitæ we have. In groups of three or five about the lawn, its effect is pleasing and valuable. The peculiar form it assumes does not combine harmoniously with most other trees. It should be only used sparingly in mixed groups and then always among slow-growing evergreens of slightly similar forms. SAMUEL PARSONS.

THE BANANA IN CALIFORNIA.

WM. O. L. DREW.

PROSPECTS OF BANANA CULTURE.

THE Banana, Musa sapientum, has until recently, been looked upon as only possible of successful cultivation in full tropical climates, but as our knowledge of the capabilities of our soil and climate has increased, the possibility of successfully growing the Banana within our borders has been advanced, and a few have been bold enough to attempt its cultivation. These pioneer attempts or rather experiments at Banana culture, have been attended with very satisfactory results.

As yet it has only been shown that the Banana can be successfully and profitably cultivated in Los Angeles and San Diego counties, but experiments will probably prove that it will thrive in other localities. Not many years ago it was the general opinion that the cultivation of such tropical fruit as the Lemon, Orange and Lime, was only possible in the same favored section. A few years' trial and experiment, however, have shown that they may become with us quite as common and plentiful as other less tropical fruit; for instance, the Apple, Peach, Plum, or Pear. They are now grown successfully in quite every county from one end of the State to the other. As with the Orange, a few years' experiment with the Banana will probably extend its range of successful growth to many other counties.

THE PRESS AND BANANA CULTURE.

To show what has been done, I would make a few extracts from some of our State papers. The San Diego News, August 8th, 1877, says: "Mr. ASHER sent us on Saturday, a package of the Bananas raised on his place, that, we think, are very good, so far as we are capable of judging. The variety is the "Dwarf Sandwich Island," and although the fruit is not very large, it is delicious, and we are told the yield is good. Mr. ASHER is testing this variety, and seems impressed with the idea that it will do well. He has a large number of them now fully acclimated, and, before long, sufficient tests will have been made. Up to this time, they have given the best assurances of successful cultivation."

The same journal in a later issue says:—"We looked in at the Bananas of Mr. ASHER, yesterday, and found them doing well. His Cavendish variety is fruiting in good style, and we noticed among the other sorts, one of the largest we have ever seen, but did not get the name of it."

The Los Angeles Mirror, Nov., 1877, says:—"During the present week, we saw a Banana plant of the variety known as the Chinese Dwarf, growing upon the place of Mr. C. E. WHITE, which beats anything in the Banana line we ever heard of. This plant has one bunch containing about 170 nicely formed and rapidly developing bananas. The fruit retails in our market at five cents each, which would make the value of this bunch to be the handsome sum of $8 50. All of this variety upon his place promise the same prolific yield." I might give many other similar extracts, showing that the successful culture of the Banana is no longer a doubt in California.

SORTS.

FLORIDA BANANA.—This variety will, without doubt, be the most profitable in California. It is known botanically as Musa Cavondishi. It is a native of China, grows five to seven feet high; fruits in ten months, bears considerable cold; indeed, it will stand quite a severe frost, and still fruit. The outer leaves, it is stated, may all be cut off with frost, but with such warm suns as we have, they will soon send out new leaves and keep on growing. They have no seed and are propagated only from suckers.

CHINESE DWARF BANANA.—It has generally been considered that the Chinese Dwarf was too tender for this climate It has been fruited, however, during the last season in several instances, and will probably prove a staple variety: native of China; grows three to five feet high; fruit fair to medium size and delicious.

SANDWICH ISLAND, OR PANAMA BANANA.—This species will hardly be found satisfactory in California, as it requires a longer season of warm weather than can be had in any locality in this State, unless started under cover and protected in the fall and early winter. It is known botanically as Musa paradisiaca; grows from seven to twelve feet high; fruit large, delicious and wholesome.

CULTURE.

The Banana has a perennial root or bulb, about the size of a large, say two to four pound, turnip. Having procured bulbs, or plants rather, from one-half to four or five feet high, plant them eight to twelve inches deep, and six to eight feet apart. It will require two years to fruit plants under four feet high, while plants over that will generally fruit inside of a year. The soil should be rich, warm and deep, as they require forcing and will stand plenty of it; mix half-decayed manure thoroughly with the soil, in no case must fresh manure be used, as it will burn or kill the bulbs. Irrigate and cultivate well. As they require plenty of moisture, a good soaking should be given them every week or, at least, once a fortnight. In one year from planting, if small plants have been set out, the sucker or bulb first planted will stand five to six feet high, and will be surrounded by three or four smaller suckers from the root. One of these suckers or new plants makes it appearance from the root every two to four months. Each stalk produces but one bunch of fruit, then it dies down or should be cut off near the ground, to decay by the root, and furnish fertilizing food for the new plants coming on, which continually sprout from the old root. By the end of from one to two years, according to size of plants set out, fruit may be gathered from the parent stalk, while from five to six suckers will be growing from the root. All of these but three should be removed, for more than three growing at once, are not to be desired. If not removed, in the course of three to four years there will be six to twelve plants struggling to out-do each other and live. Many of them would fail to bear at all, while those that would, could hardly perfect fruit; consequently remove and set out somewhere else all but three.

THE BANANA AS IT IS.

The Banana, or Musa sapientum, is a near relative of the Lily family. They are not trees, as so many ask, or as you will frequently see in some journal, "Banana Tree."

Each stalk bears but once and then dies as does the Lily, only the lily stalk dies in one year, while the Banana takes two years to attain its growth before it dies. In its tropical home, the plant attains a greater hight than under cultivation; the stem is round and straight—light yellowish-green in color; the foliage is large and spreading, ovate in shape, some four to six feet long by fifteen to twenty inches broad; it is of very delicate texture and is seldom met with perfect, being torn more or less by the wind; it has a thick, strong mid-rib running through the center. The foliage surmounts the stem like a crown. When the stalk is from eight to ten months old, a tuft of blossoms appears in the center of this green, leafy crown, a great brownish-colored bud, which lifts up a covering every day or two, displaying ten little Bananas, more or less, with a peculiar bloom on each. The blossoms are heavy with odor, and while in bloom are the delight of the bees. They are followed by a cluster of fruit, eight to ten inches in length, which attain their growth and maturity in from ten to twelve months. The clusters, when ripe, weigh from 35 to 80 pounds, and contain from 75 to 150 separate bananas.

Such is the plant from which is obtained the rich clusters of roseate and golden fruit so delicious to the taste, and known as the banana.

It is claimed that half an acre of Bananas in the tropics, will support fifty persons.

El Dorado Co., Cal.

Miscellaneous

THE TRUTH ABOUT IT.

[UNDER this heading, a number of articles have been prepared by able writers. These will appear from time to time. Their object is not at all to deal with "humbugs"—but with the many unconscious errors that creep into the methods of daily country routine life.—EDS.]

CAUSE AND EFFECT.

L. A. ROBERTS.

IT has been the custom among all nations to credit effects of which the causes were not readily perceptible to a supernatural origin, and we find that the more ignorant a people were, the more permanently had superstition its home among them: the less they knew of the laws which govern the universe, the more ready they were to attribute physical changes to some imaginary cause, however distant it might be from the right one.

It is intensely interesting and highly instructive to follow the progress of nations and see, with the passage of time, the clouds of superstition break away before the advance of intelligence. One who has read such works as Leckey's History of Rationalism in Europe, and noticed how slowly false ideas and beliefs give place to truth, can scarcely wonder that there is yet so much superstition left among us—for much there is, deny it as we will.

Of this much, not a little holds its place against intelligence and against reason, being the effect of early education which, although it may be erroneous, often obtains such an influence that it is impossible to entirely eradicate its effects. How many of you who read this fail to experience at least a symptom of a shudder, when you first see a new moon over your left shoulder, and how many hesitate to commence on a Friday a journey or any undertaking of importance that can be done as conveniently on any other day.

There is an influence, name it what you will, that has grown with you from your childhood, and although your reason and your education, alike prove to you your weakness in being affected by it, still it exists and will so long as you live, but probably not to an extent to control your actions in any great degree.

That every effect has a cause is a maxim so self-evident that uneducated people accept it without question. But their ideas of the relation of cause and effect are vague and erroneous in the extreme. The list of "infallible signs" is slowly but constantly growing shorter with us, as some drop out with every generation. Fifty years ago the belief that the planets exerted influence on the earth and its inhabitants was rife, and the signs of the Zodiac were studied with as much confidence in their power and authority as were the ten commandments, while the weather prognosticatious, as laid down in the almanac, were relied upon as explicitly as are those of "Old Probabilities" to-day.

Among the many signs that were current in the rural community where I spent my boyhood, a few occur to me as I write.

"Kill your hogs in the waxing of the moon, or your pork will shrivel in the pot."

"Timber cut while the moon is growing smaller, will decay with great rapidity."

To spill salt indicated a quarrel. [This must be very old. In the picture of the Last Supper, Judas appears to have just overturned the salt-celler.]

To sow or plant fennel seed is sure to occasion a death in the family. [In order to avoid this sad contingency and still have fennel—profanely called meeting seed, from the fact that the dried heads were usually carried to church to be nibbled—it was customary to beg *roots* from neighbors: when none could be had, the seed was placed on a stone just before a shower that it might be washed off and take root, an easy way of circumventing fate.]

The inner bark of the Box Elder was valued for its medicinal properties. When needed as an emetic, it was scraped off by an upward motion; for a cathartic, by one downward. [We once heard a physician, who seemed somewhat skeptical, inquire if the experiment had been tried of administering it when obtained by scraping around the stem instead of either up or down; and if so, what was the result.]

When the head of the household died some one was deputed to visit the bee-hives, and, after rapping on each three times, informed the occupants that they should be taken care of, else they would all leave the hives.

When a new moon appeared, it was said to be either a wet or dry moon according as the position of its horns approached a horizontal line, and the work of the farm was arranged accordingly.

Certain days in one month were regarded as indications of the state of the weather for the next month, but I remember there was a difference of opinion as to which were the almanac days.

To break a looking-glass was a bad sign; information of the death of a friend would surely follow.

I might extend these signs but, doubtless, most readers, especially those in the country, have recollections of those now or formerly current in their neighborhoods sufficient to fill a full page of the RURAL.

It is curious how one coincidence will, with those who believe in signs, overbalance a score of failures—but perhaps not wonderful after all,—for it is well known that the manner and mind with which we search for a thing, materially affects the finding of it. A lawyer passes over half a dozen decisions averse to his case, hastily, but reads with the closest attention one that is favorable—and with a theologian, one text in proof of the correctness of his position weighs more than a dozen against him.

The howling of a dog in the night is a sign that a death will soon occur. The Pennsylvania Dutchman whose faith was fixed on this sign, gave an incident in proof of its correctness thus: "One night mine old dog Bose he howls all the evening, and he howl like every tings, when me and mine frau go to bed and in the night Katrine she vake me up and say: 'Hans I not sleep pretty much any. Bose he howl so, vat ish de matter?' And I say, 'Sompody vill be dead pretty quick already'—and den we go to sleep mit ourselves, and de next morning I look in mine paper and by jingo dere was a man died in Cincinnati."

There are, among the multitude of signs, some that are entitled to consideration, being the result of intelligent observations and having their foundation in natural laws; as when the smoke ascends from the chimney in an upright column, it is a sign of fair weather, but when it soon falls to the ground and when the water in the pot quickly flies away in steam, rain may be expected. 'When it is evening, ye say it will be fair weather, for the sky is red; and in the morning it will be foul weather to-day, for the sky is red and lowering.

Observing men in the country, and those who sail the seas, acquire a reputation for being weather-wise. "Where are you going in your Sunday clothes?" said an old fellow who lived in a town adjoining ours. "To church," was the reply. "On account of this continued drought we have appointed to-day on which to meet and pray for rain." "Praying may be well enough," was the irreverent reply, "but so long as the wind goes round with the sun you won't get rain." That man had observed that while the wind was easterly in the morning, southerly at noon, and westerly at night, no rain fell, but probably never thought what was the reason of it, or imagined that it was the result of a law.

The truth about it is that the whole physical world is governed by laws fixed and invariable; nothing is left to accident or chance. Not a cloud is formed; not a drop of rain falls except in harmony with these laws that have existed since the beginning, and will continue to exist to the end of time.

The study of the Natural Sciences is all that is necessary to banish superstition, and it is not necessary for this purpose that the study should be very thorough or extended. The merest tyro in astronomy knows the reason why the position of the horns of the new moon is not always the same, and in Physical Geography, that whether they be in one position or the other, no rain will fall in certain sections during the dry season, and that a dry moon would be a misnomer during the other part of the year.

When we are wiser than now we shall study nature's laws more attentively and with greater practical results.

CAPT. CUTTLE'S ADVICE.

B. PICKMAN MANN.

To "make a note of it" is a very good piece of advice, but to know how to "make a note of it" is an art which must be acquired by experience or instruction. It may not be amiss, therefore, to offer a few hints which are the outcome of years of experience in this very direction.

It is startling to realize, in the first place, how many ways there are in which a note may be made. We may copy what we are interested by, or we may refer to the place in which we find it, by preparing some sort of index. We may make these notes on loose sheets of paper or in a book; if we use loose sheets, they may all be of one size or may be of different sizes; they may be arranged by subjects or alphabetically, and the same way of arrangement may be adopted for the index to a copy-book or a book of references.

If we arrange our index by subjects we are plunged immediately into an infinite world. What are the leading divisions of knowledge? A classification which has obtained wide recognition divides all knowledge into—1. Philosophy, 2. Theology, 3. Sociology, 4. Philology, 5. Natural Science, 6. Useful Arts, 7. Fine Arts, 8. Literature, 9. History. The same classification divides the Useful Arts into—(6)1. Medicine, (6)2. Engineering, (6)3. Agriculture, (6)4. Domestic Economy, (6)5. Communication and

Commeree, (6)6. Chemical Technology, (6)7. Mauufactures, (6)8, Mechanic Trades, (6)9. Building. The same classification divides Agriculture into—(63)1. Soil and preparation, (63)2. Pests and hindrances, (63)3. Productions of the soil, (63)4. Fruits, (63)6. Garden, (63)7. Dairy, (63)8. Bees and silkworms, (63)9. Fishing and trapping. (This ninth division is put here, not because it really is a part of Agriculture, but because any other place for the subject would be still more unnatural).

Suppose the classification is a good one. We read an article about the diseases of cows, and wish to make a note of it. Shall it go under 619. Veterinary medicine, or 632. Pests and hindrances, or 636. Domestic animals, or 637. Dairy? Will anybody else know what classification you have adopted, and where you have placed your subject?

Suppose the classification is not a good one, or that you are not satisfied with it, can you make a better one, and will other people accept yours when it is made? Can you remember next year what your arrangement of subjects was this year? Will you not want to make a new classification every year as your knowledge grows and you see things in new relations? Such has been the experience of former workers in all times. It is necessary to have an alphabetical index to the classified index, in order to be able to use the latter, and to change the latter as often as we find it is unnatural, unless we prefer the inconvenience of a changing one. Still, for some purposes a classified arrangement is needed, and learned men have made such. How nice it would be if they had only made one! If you will adopt and stick to one of those which other people have access to also, then, and then only, can other people use your index, or can you use it yourself after a few years.

To obviate the difficulties mentioned above, it is pretty generally agreed that it is well to make alphabetical indexes, and to avoid all classification, when this can be done. We all know the alphabet—the classification of the letters. In a systematic index we do not know whether horses come before pigs, or hogs before cows, or cattle before swine; but in an alphabetical index we can turn immediately to bull, calf, cattle, cow, ox, or to colt, hog, horse, mare, pig. But here is another difficulty. How shall we choose the word which is to determine the place of our subject in the index? Shall one writing be indexed under the word swine, and another under hog, and another under pig? Shall this which I am writing now, be referred to under Capt., or under Cuttle, or under Advice, or under Index? For you know you want to look for the article some time in your index, and you will have forgotten what the title of it was; you will look for what has been written on the *subject*. The publishers of the RURAL NEW-YORKER say that the RURAL is indexed with great care, but I look for articles on grasshoppers and find them indexed thus:

Around the Republic.	Grasshoppers, a visit from..	235
Editorial.	Grasshoppers in Minnesota.....	284
"	" on the plains.....	124
"	Locusts, Rocky Mountain.....	156
Entomological.	Grasshopper, Congress and the...	249
"	" scourge, conference of Governors on the,...263,	263
"	Locusts, the Western.....202,	203
Farm Economy.	Grasshoppers, protection ag'st...	198
"	" routed, the	9
Industrial Topics.	Grasshoppers' Convention....	342

If these leading words, which have a very accidental relation to the subject, were removed, and the subjects arranged alphabetically without them, I might find all these articles under two words, "Grasshoppers" and "Locusts," without having to read every title in ten columns of fine print. Here are some more entomological titles from the RURAL NEW-YORKER, arranged without reference to such division headings as those above.

"A little learning not always a dangerous thing,"	70
American vines in France.....	332
Exterminate the potato bug.....	384
Facts and fancies from the Rocky Mountains,....	377
Fighting the potato beetle.....	32
Hennery, the pest of the.....	41
New potato enemy.....48,	64
Pen-liners on tomatoes.....	174
The hickory scolytus.....	174
To drive away grasshoppers.....	384
Wonderful power of an insect.....	318

Having chosen our kind of index, shall we make it continuous or shall we leave spaces for future insertions? If the latter, where shall we leave spaces, and what will we do if we want space where we have not left it? To overcome this difficulty, general use is made of slips of paper or card, large enough for one full reference, but small enough so that a new card may be afforded for each new reference. My cards are so ruled that I can put at least fifteen references on each card, but yet each card is confined to only one subject. For instance:—Iceland; Ignorance; Entomological; Immigration; Immortality; India; Infant mortality; Inheritance of mental qualities.

The librarians and the publishers have most occasion to make indexes. Those of the United States and of Great Britain have agreed upon the manner in which indexes should be made, the size of card that should be used, and co-operation in the publication and exchange of these card-indexes, so that soon all the English-speaking people will be working in harmony in making the former writings more accessible to future inquirers.

YOUNG MAN, GO WEST?

HAVING JUDGMENT, AND USING IT NOT.

VERY much gratuitous advice to go West has been given to a class of individuals who may be considered as having natural sense and judgment, but who seem to be lacking in independence of character and executive abilities, or having judgment, use it not. The advice may be all well meant and honestly expressed, but may it not be somewhat differently expressed, and at the same time be more practicable? I imagine that those who give such advice do not look at it in all its bearings.

Why is it thus expressed, and given? a question I am unable to answer, unless those who give it, do so without looking at the matter from every side. The more general reason given for recommending this course of going West, is that these men may become possessed of cheap lands; have a home of their own; become producers instead of consumers only. What if we all, at least all the surplus not actively engaged in business, become producers? From certain standpoints the advice is good, but viewed from a different point it may assume another aspect.

Look at it as it really is: do not the farmer-producers of the West find their surplus products have a slow market, and at very low prices, and that they must produce in very large quantities in order to pay their way, or often to make even enough to meet taxes, beyond a meager support. And how is it that anything is accumulated? Let those who have there gained a competency tell us if they have got it by legitimate farming only. Setting aside the rise in value of farm lands, etc., they have probably done it by close economy, hard work, and denying themselves most of the luxuries and privileges of life, if not very many of what are usually considered its necessities.

Now, I claim that one living in any of the older-settled States and communities, by exercising the same self-denial, etc., may do even better at home than he would by going to some far-away place to settle. In the first place, he is at home among friends and acquaintances, is acclimated, knows all the "ropes," is in the vicinity of as good markets as there are in the country, can produce and sell at a better profit than can be done where markets must be sought at long distance, saves the expense always attendant upon locating in a new country and escapes consequent hardships, besides many other considerations of social and other privileges; advantages which are not so freely offered in new settlements.

As to products; let us consider the one product of corn, which is so largely depended on in many newly-settled sections. Can we not at the East grow it at a better profit than the settler on new land? And is not the value of the farm products, taking into account the whole acreage, as great, or even greater here, than at the West, generally? Let us see: here in Massachusetts, not more that 50 miles from Worcester, a few years since—and it is done yearly although not reported or noticed as publicly—a reverend gentleman grew a field of corn, produced entirely by hired labor—the yield of which was 100 bushels of shelled corn per acre, costing, at that time, only 45 cents per bushel, in the barrel or bag. This same corn sold at 90 cents per bushel at home, thus netting a profit of $45.00 per acre. With later improvements in culture, the cost of production would be less; will the richest virgin soil do better, or even as well?

Take a farm of 100 or 160 acres at the East or West, if on the line of R. R. or near communication with good markets, the price per acre of land, will range nearly as high in the West as in the East. At the latter place, however, this will include fair to good buildings, fences, etc. If the products are the same, those in the eastern section will bring the greater sum, so that the gross product will be greater at the East, because of better home-markets, and then home-products are worth more than those produced at a distance, handled and rehandled, sweating and often moldy. I believe experimenters claim that corn grown in New England is worth for feeding at least one-fourth more than the average corn we get from the West; some claim it to be even better.

Look at the deprivations which the pioneer settler must put up with. In order to obtain free homesteads one must go into parts where settlements are very far apart, where perhaps none of his kind may be found in a day's journey; where there are no social or other privileges except such resources as they may have within themselves. If sickness or accident overtake them, what then? A young man from a village in this locality went to Kansas, four or five years since, stock raising for a relative of his; a year or two afterwards, his married brother and wife visited him and stayed some three weeks. The lady, in speaking of it afterwards, said that she saw only one other woman during her stay, and she, a washerwoman who came to do the young man's washing, etc. Now, suppose this, or any other young man, would work as hard, deprive himself of as much, in any of the Eastern or Middle States, where he was at home, etc., and was in every way as economical, who supposes he would be less successful at home than abroad? The truth of it is, that it is not what a person receives that constitutes wealth, financially, but what he *saves* after expenses are paid. And one working and doing as economically where he is already known, close to good markets, will usually take the lead of the restless one who desires change and can see all of the advantages in some different locality. All honor, however, should be accorded to the pioneer who opens new territory, when he can do the same without injustice to previous occupants.

W. H. WHITE.

CATALOGUES, ETC., RECEIVED.

LASELL SEMINARY for Young Women, Auburndale, Mass.

WE would invite attention to Col. CURTIS' offer to RURAL subscribers, of Duroc pigs at reduced rates.

E. E. HARDIN & Co. Descriptive Circular of superior pure-bred chicks, to be delivered after Sept. 1st. Scotia, N. Y.

RYDER'S AMERICAN FRUIT DRIER or Pneumatic Evaporator. A catalogue of sixteen pages. Chambersburg, Pa. Catalogue free.

R. H. HAINES, Saugerties-on-Hudson, N. J. Summer Price-list of Strawberry plants. The rapidly increasing demand for plants for setting out at this time of the year, induces Mr. HAINES to issue this list.

THE Texas State Hort. and Pomolog. Ass'n will hold its fourth annual exhibition in the city of Houston, Texas, commencing Wednesday, July 17, and continuing three days. A. B. Small, Pres.; Geo. Kidd, Sec'y.

CATALOGUE of the List of Premiums offered by the Jefferson County Ag. Society for 1878, Annual Fair to be held in the city of Watertown, N. Y., Tuesday, Wednesday and Thursday, Sept. 17-19. W. R. Skeels, Sec'y.

L. L. Crocker, Buffalo Fertilizer Works, No. 252 Washington St., informs his customers and friends by circular that he inteuds immediately to rebuild his works which were destroyed by fire and which involved him in a loss of over $100,000. He will be prepared to meet the wants of his customers for the fall trade and guarantees to furnish a super-phosphate which shall be at least equal in quality to his former shipments and which can be used in any drill.

THE American Berkshire Association, through the earnest efforts of the Secretary, Mr. PHIL M. SPRINGER, Springfield, Mass., and other officers, is growing apace. Volumes one and two of the American Berkshire Record, have been issued, and volume three is in course of preparation. That the advantages of a recorded pedigree are appreciated, is evident by the fact that the second volume contains some five hundred more entries than the first, and the approaching issue bids fair to show a still greater increase. These records are one of the best guarantees that inexperienced buyers will get pure stock in their purchases, and breeders should lose no time in forwarding for entry pedigrees of their stock. Blanks for the purpose will be furnished, by applying to the secretary.

A. HANCE & SON, Red Bank, N. J. Pamphlet of pot-grown and other Strawberry plants. Cultural Notes; Soil and Situation; Preparing the Soil; Hill System—Matted-row System; Mulching. Messrs. Hance give a tabular list which, from their many years of practical experience, they have found to be the best:

ARRANGED IN ORDER OF MERIT.

For light soil.	For loamy soil.	For heavy soil.
	EARLY.	
Wilson.	Duchesse, Wilson, Black Defiance.	Duchesse, Black Defiance, Wilson.
	MEDIUM OR MAIN CROP.	
Chas. Downing, Seth Boyden, Wilson, Agriculturist.	Monarch, Chas. Downing, Seth Boyden, Wilson, Agriculturist.	Monarch, Jucunda, T. de Gand, Seth Boyden, Chas. Downing.
	LATE.

	VERY LATE.	
Kentucky, Capt. Jack.	Kentucky, Col. Cheney, Capt. Jack.	Pres't Wilder, T. de Gand, Col. Cheney.

The pamphlet will be sent free to applicants.

Entomological.

JOTTINGS FROM MY NOTE BOOK.

CLINTON.

A NEW INSECT.

A new insect has appeared this season, infesting my Wiegelas—at least it is new to me. It would seem to be the product of an egg, deposited in the newly-grown wood, usually a few inches below the terminal bud. The first indication of the presence of the insect is the wilting of the branch above the place where it is punctured. On examination, I have usually found one, and sometimes two insects in the heart of the branch, evidently eating their way upwards. The insect, when full grown, is about one-eighth of an inch in length, which is about three times its diameter. The color is a brownish-black, with several bright yellow rings marking the body transversely. Of course, all that portion of the branch which is above the puncture speedily dies, materially disfiguring the shrub. Circumstances beyond my control prevented my making as full an investigation at the time as I intended, and now—July 2—I am unable to find any specimens remaining. From my imperfect description of the insect, can any of your readers name it?

HELLEBORE AND THE CURRANT WORM.

I am somewhat surprised that a writer possessing the evident general intelligence of your correspondent, Col. F. D. Curtis, should, at this late day, even indirectly recommend the use of *soap-suds*, as a remedy for the currant worm. After using the white hellebore a few times, he will find it to be the most sure remedy, and if it is properly applied, the expense for the material is but a trifle. My method of applying it differs from Dr. Hoskins', as described by him in the RURAL of June 8, and for my purpose, I think it is much more convenient. He mixes the drug with water, and applies it with a sprinkler. His method, it seems, involves the necessity of a horse, a stone-boat, and a barrel of water. The necessity for these incumbrances may be obviated by using the material in a dry state. I take a tin box, like a cook's dredger, put the powdered material in that—first crushing the lumps, if there be any—substitute for a cover a piece of gauze or mill-cloth, large enough to fold down the outside of the box sufficiently to be tied with a piece of twine, and I am ready for action. A sufficient number of thicknesses of covering should be used to prevent the hellebore from coming out too rapidly when the box is shaken. Taking the box by the bottom, shake it rapidly about and among the bushes, so that the powder shall pass out, like a fine, impalpable dust, and settle on the leaves. This should be done when there is no wind, and if the leaves are wet with dew, the drug will adhere to the leaves as surely as if applied with a sprinkler. It is surprising what a small quantity of the hellebore will prove sufficient, if properly applied. As Dr. Hoskins says, it is entirely unnecessary to apply it to the under-side of the leaf, as the worm eats the leaf clean, and is sure to get the poison, if it is on the leaf at all. But I notice in your "Brevities," in the same number of the RURAL, you refer to his opinion as being just the reverse of this—probably a mis-print or an oversight. [It was our neglect.—EDS.]

THE POTATO BEETLE—IS HE PLAYED OUT?

S. E. Hampton, of Kentucky, in the RURAL of June 8th, gives to the Potato Beetle an exultant "*farewell*," because he found on his field of 15 acres of potatoes, but very few of the beetle's eggs had hatched up to the 26th of May. The RURAL expresses a similar opinion in its "Brevities" of June 15, with reference to Bergen Co., N. J. I confess I had been inclined to lay the same "flattering unction to my soul" until quite recently. But at this date, July 2d, with the mercury ranging from 85 to 95° in the shade, the eggs are hatching in great abundance, and I shall at once resort to the use of Paris-green, as formerly. The delay in the hatching of the eggs cannot be attributed to any *frosts* in this locality; for, although we are in the latitude of 43° north, yet we have had no frosts in our valley to injure vegetation in any perceptible degree since April, and, of course, not sufficient to affect the eggs of the potato beetle. At the identical time that the RURAL GROUNDS, and other localities even further south, suffered so severely from frosts, I had in my grounds, not only Tomatoes, Cucumbers, Squashes and other tender vegetable plants, but also such house-plants as Heliotropes, Achyranthes, Coleus, Balsams and choice Pelargoniums, standing out without any protection whatever, and coming out entirely bright and uninjured. It was not so in other parts of the county, however.

Veterinary.

MALADIES OF STOCK.

INQUIRIES ANSWERED BY D. E. SALMON, D.V.M.

Bone Sprain and Ringbone.

F. H. D. No address—inquires if there is any sure and safe cure for bone sprain and ringbone of several years' standing?

ANS.—No; there is no *certain* cure for either of these troubles; and, unfortunately, the same holds true in most other diseases. Proper treatment, however, greatly increases the chances of recovery. In case of an old-standing sprain or ringbone, there will always remain more or less enlargement. The best treatment is to apply bandages and keep constantly wet with cold water, for about a week; then blister several times in succession or until the lameness disappears. Cantharides ointment—one part to four of lard—may be used, with the usual precautions, to only blister one limb at a time, to tie the animal so that it cannot get its nose to the part, to wash off the ointment and apply oil or lard after a suitable effect is produced, etc. Firing sometimes succeeds when blistering fails.

Blind Staggers in Horses.

S. Hoxie, Madison Co., N. Y., asks the cause of blind staggers in horses and a remedy therefor.

ANS.—Blind staggers is a term applied to several diseases, and it generally requires an expert to decide what is the matter. Thus, it may be caused by pressure of the collar on the large veins of the neck; by congestion of the brain; tumors or effusion in this organ. The term is also applied to the brain symptoms resulting from overloaded stomach or indigestion, or from poisons. In other cases the real trouble is blood poisoning from disease of liver or kidneys, or, perhaps, cerebro-spinal meningitis. It is impossible for us to give particulars in regard to all of these diseases; a good veterinary surgeon is indispensable for the successful treatment of most of them.

The Querist.

ANSWERS TO CORRESPONDENTS.

The best Breed of Cows for Milk.

R. N. Richards, Newton Co., Ind., asks which is the best breed of cows for milk.

ANS.—The answer will, in a measure, depend on the use made of the milk. Farmers who sell milk and care nothing for its quality, patronize mostly Short-Horn grades ont of good-milking common cows. Those who make cheese or butter prefer Ayrshire or Ayrshire grades. Those who aim chiefly at fancy butter, or who wish very rich milk for special customers or for their own table, have a preference for Jerseys. Great milkers occur occasionally in all breeds. The Devons, too, give a great deal of rich milk, while the Holstein, or Dutch, cows have likewise a great name as very heavy milkers. In France also, there are several native breeds which are highly prized, but whose names are hardly known to even the skillful stockmen of this country.

What is Muck?

H. R. Clemens, Bradford Co., Pa., asks what is meant by the term "muck," as he sometimes sees it applied to substances which, according to his opinion, are by no means included under it.

ANS.—Muck is manure, in English parlance, and embraces pretty nearly everything in that line that is soft or moist and pasty. In this country the word, in agricultural technology, is almost exclusively applied to the partly decayed vegetable matter of swamps and peat mosses, sometimes even to peat fit for fuel, if it is used as manure or an absorbent in cattle stalls.

Steam-Plowing.

W. L. Walker, Sedgwick Co., Kans., asks whether steam-plowing is found profitable among farmers in England, or whether its use there is confined merely to amateurs?

ANS.—Certainly steam-plowing is decidedly profitable on land suitably level among the best kind of practical farmers across the Atlantic, not only in Great Britain, but also here and there on the Continent, in India and in the cotton fields of Egypt, and its use is yearly becoming more common. The cost is still high, from £400 to £750. The average area of grass land turned under in a day's work is about ten acres, while of stubble land fully twenty-five acres are thoroughly broken up to a depth of nine or ten inches with the grubber or cultivator, which is considered to do better work than the turning plow used for grass lands. Our western prairies are excellently suited for this kind of cultivation, and despite the comparative scarcity of fuel in some places, and the lower price of horse labor everywhere, still there is little doubt but that steam-plowing would there prove profitable. Indeed the plows have been used with satisfaction in several parts of this country, notably in New Jersey, Illinois and Louisiana, and have been on exhibition at several of our fairs.

Destroying the Canada Thistle.

R. H. S., Linesville Station, Pa., asks for the shortest, surest and best means of destroying the Canada thistle?

ANS.—The more persistent any evil, the greater the number of "infallible" remedies for it; and so it is with the Canada thistle—so many methods of "certainly" eradicating it have been given, that it is a trifle strange it should still be a pest to the farmer. The three that answer most closely to the above requirements are, First: Cut Canada thistles in the summer, after they have thrown up their flower stalk, but before they have bloomed, and if a pinch of salt be dropped into the hollow stems, they will soon die. Second: When the thistles are cut frequently with a spud or other tool just at or below the surface, they rapidly disappear. Third: If a small quantity of coal oil is applied to them whenever they show themselves, there will be an end of them; but as coal oil kills other plants with which it is brought into contact as well as weeds, and may prevent the growth of vegetation on the same spot for a considerable time, care must be taken in using it.

Saltpetering Stumps.

S. M. Smith, St. Louis Co., Minn., writes: "I saw it stated some time ago in the RURAL that, if a quantity of saltpeter, together with some water, be inserted in a hole bored in the top of a stump, and the hole be then plugged up, the saltpeter will enter every root and fiber of the stump, so that in dry time next spring, it can be easily burnt and destroyed. In this woodland country, where many are engaged in clearing land, if such a simple device were really practicable, it would be a great help to hundreds of us." And he requests that some reader of the RURAL NEW-YORKER who has actually tested the matter, will state through these columns the real result of his experiment or labor.

The Wiegela.

M. F. C., Ovid, N. Y., asks the correct mode of spelling the name of a shrub which he has seen spelt in several different ways.

ANS.—It is Wiegela, after the Latinized name of a German botanist who lived toward the end of last century. Botanists have since, however, placed it in the older genus Diervilla, after a French surgeon named Dierville; but the name Wiegela has become so well established that it still remains the common, or English, name for this beautiful shrub, originally imported from Japan.

Propagating the Wistaria.

Mrs. Minnie Ellis, Eaton Co., Mich., asks how and when to propagate the Wistaria Vine.

ANS.—By cuttings and layers. Layers may be made now or later. Take the long shoots and bury them six inches deep and press the earth firmly over the buried parts. Next year the stems connecting the buried and parent stems may be severed, and the rooted cuttings transplanted.

Miscellaneous.

Mrs. H. W. Burton, Lincoln Co., N. C., asks what is the matter with her Apple Geraniums. They appear to be very flourishing, and, all at once, they begin to wilt; the leaves commence to turn yellow until all fall off. Having taken them up, she can find no cause for the mishap.

ANS.—If kept in pots, it may be that they are watered too much or too little; if out-of-doors, the situation may be too hot and dry. Otherwise, if free of insects, as you say, we can not guess at the cause.

GEORGIA NOTES.

GRIFFIN, GA., July 3d, 1878:

I HAVE have just planted my second crop of Early Rose potatoes from seed that were planted on the 20th of last February, and which, by the 10th of May, were of good size for table use, and, the vines being dry on the 10th of June, were dug and stored away in sand, to keep through the hot weather. Of course, they are stored in the shade. The small ones were kept out and allowed to dry off for a second planting. I planted in this way last year with such marked success that I am led to try it again, and in exactly the same way. In the hope that it may lead some other reader of the RURAL to try the experiment, I will give in detail how, as "Uncle Archie," my old colored gardener, says I make my garden patches do double duty both summer and winter.

First: the ground is covered with a good coat of manure from the compost heap; then it is deeply spaded and pulverized; laid off in rows three feet apart, and, at least, six inches deep. In the bottom of these furrows I plant the small-sized potatoes, without cutting, say about four to six inches in the drill. These I cover by running the "plow-hoe," my most indispensable garden tool, on each side of the drill, covering the potatoes up to a level with the surface and leaving a shallow opening, or light drill, immediately over the potatoes. Next, I fill this shallow drill with "Dwarf German Black Wax Beans," covering them with the rake, and then patting down the dirt so as to "firm it," as the gardeners say, and the work is done, leaving two crops planted in the same drill, one about four inches above the other.

Now, will the two crops grow off and mature, each as well as if planted alone? I say they will, and think I can prove it by the first of October, when I expect to have all the bean haulm pulled up and thrown on the manure heap, and a fine crop of young potatoes in good growing condition. I will state, as a reason for this practice, that the Wax Bean comes up readily and grows off, maturing in eight weeks with me. It is tropical in growth, delighting in hot summer weather, grows shallow in the ground, with comparatively few roots, and will not interfere with the potatoes. The potatoes, being planted whole, will not sprout so readily, and, being deep in the soil, will remain sound until the rains in the latter part of August, and the approaching cool weather will cause them to come up about the time the beans are in full bearing, then if the beans are so thick as to interfere with the potatoes coming up, just pick and market them and pull out the bunches, and give the potatoes a good working over, and all will go on well with them; but if they don't come until the September rains, all the better—they will then be able to stand the frost in six weeks, and that never comes until the 10th of November, after which dig and store away the potatoes.

I had fine success with both the beans and potatoes last year, and hope to have the like this. I take two chances of getting a crop on the ground, and can, at any time, remove the beans if in the way of the potatoes; if not sure of a good crop of both. The potatoes might be planted later, but with me they keep better in the ground than out after they are dried off, and the labor of planting may as well be done at one time as at another. The Early Rose with me is all the time growing, and reproducing itself, and the patch once planted, is never rid of volunteers; but these volunteers become watery, and it is best to get new seed once a year from the North. These notes are applicable to Georgia and latitudes similar, or south of it, and are not expected to benefit the grower where seasons are so short as in the New England and Middle States.

J. G. RHEA.

FRIEND SAM'S MISHAP.

Or, Farming at a Disadvantage.

The other day I met a gentleman who is such a complete example of a certain class in the South, that I must give you a sketch of him, for preservation as a typical specimen.

SAM CAPEL'S father was a large slave-owner and had, besides, two farms of considerable proportions. Sam was brought up to expect riches, and to forestall any personal exertion he might be disposed to make, he had negro boys always at his beck and call, to amuse him, to wait upon him, and to talk to him. The war ruined Sam's expectations; for, not only were the slaves set free, but his father's land had to be sold for security debts. Now Sam's only accomplishment, in an agricultural point of view, lay in his ability to "get work out of the darkeys." To do this he had only to ride round and talk to them, for they were very fond of their generous, good-natured, young master. Thrown upon his own resources, Sam rented land and hired hands to work it, but this plan resulted badly, bringing him out behind every year. As fast as he built up in one way he would lose ground in another, and this notwithstanding that he had become the happy possessor of an intelligent, helpful little wife, who economized judiciously and manged his housekeeping to the best advantage. The poor fellow finally decided to take HORACE GREELEY'S advice, and "go West."

To hear him tell his tribulations since he came out here, is pitiful and funny too. "I spent fifteen dollars last winter," says he, "to get my wheat plowed in and now won't make enough for a barrel of flour. The wretched crop took the rust! I had the most serious time getting "hands" this year I ever had; picked up a red-headed vagrant hailing from Missouri, and kept him a fortnight, didn't get two good days' work out of him. He would lie down in a furrow and let his horse and plow stand for hours at a time. My next make-shift was a man who talked and walked so fast that I concluded he must be a tip-top worker, but he soon proved a "perfect stick," and a nuisance for his unreasonable demands and impertinence;—would get out to his work about nine o'clock in the fresh spring mornings, take out at eleven, and not go back till three.

'Why, Mr. Sam, I'm astonished that you should have kept such a fellow!'

"Well, you see, I was afraid I'd have his crop on my hands, and I'm too stout to work long in the hot sun. I got rid of him at last, and by dint of extra managing got his crop cleaned, had a fair prospect for a good crop of corn and cotton, when—what do you think happened?—Why a negro that I had "picked up" to do a few days' hoeing, came back in the night and stole my best horse out of my stable, bridle, saddle, and even saddle-blanket."

I never heard of such a country as this for horse thieves. Their general plan is to take the stolen horse to the city, lie out with him a few days, till the excitement of his loss subsides, then sell him, and run off with the money.

Happy husbandman indeed, mourning dog-slaughtered sheep, cholera-killed hogs, rust-eaten crops, and mysterious disappearance of horses, with such fancy touches as "billious spells" "chills" and "typhoid malarial" to serve as mile-posts along his route.

A word of advice in your ear, friend Sam: plant a smaller acreage, hire less help, don't eat so much hog meat, and take a hand yourself every day; maybe then your luck will turn.

MRS. V. D. COVINGTON.

De Soto Co., Miss.

RURAL SPECIAL REPORTS.

CRAWFORD CO., ARK., July 3d, 1878.

WE of the West, are not a reading people. Farm work is poorly done, as a general rule, while our plows and all farming implements are of inferior quality; horticulture is much neglected, and what there is of it, is done in a slovenly manner. Had we not the most genial climate and a highly productive soil, with good water, fine timber, and broad ranges for stock, our people could not afford to neglect their farms, their gardens and orchards, as they now do. The lazy man is fortunate that finds his way into western Arkansas, and it would seem that many a one has struck the lucky path that has led to this land of easy plenty. Literally speaking, this is the easiest country for a poor man to live in while indulging his lazy habits, that exists in America. For, notwithstanding all her drawbacks, our country abounds in the greatest abundance of food, with an immense cheap surplus.

The cereals, especially wheat and oats, are grown in great quantities, with almost no preparation of the soil whatever. Corn is planted very often without previous breaking or preparation of the land after the previous crop, and pretty fair returns are withal produced. Although orchards, consisting largely of seedlings of accidental or spontaneous growth, like all other things, receive but little or no attention in regard to pruning or cultivation, yet our land abounds in fruit, much of which is equal, or even superior in quality, to that grown in the Old States.

I do not desire, however, to be understood as saying that we have no good farmers, gardeners and stock-raisers, or fine orchards and nurseries of the choicest selections of all kind of fruits suited to our climate. Our finest Apples, and some of our finest Peaches are native seedlings. Of Apples, the Shannon, the Stevenson Pippin, the Red Reserve, the Red Banana, the Peerless, the Arkansas Queen and some others, are all choice early and late winter fruit. The Shannon, which I am very certain is an Arkansas seedling, I find confounded with the Ohio Pippin, by Doctor Warder, in his able work on pomology. The fruits of the two varieties, when compared by sight alone, resemble each other very closely; but try them by the palate, and the difference is not hard to distinguish. With regard to the Shannon apple, it is the expressed opinion of every one that I have yet seen and conversed with who had eaten it in its prime, that it has few if any equals, and no superiors in the world. Its large size, its obconic form, its rich, golden color, together with its creamy pulp, its high flavor and sprightly juice can hardly be surpassed by any one apple in America. I have promised Mr. Charles Downing, of Newburgh, N. Y., to send him some specimen Shannon and other Arkansas seedlings, and shall be very much disappointed if he does not report favorably of them.

Myself and others forwarded a few barrels of our fine apples to the Centennial; among them the Shannon and Stevenson Pippin, our finest varieties. But, unfortunately for us, they reached there in bad order, and were not, of course, calculated to attract attention. Very nearly all of western Arkansas is a broken, rolling, hilly country, and none of it is too poor to produce choice Apples, Pears, Peaches, Grapes, Plums, Cherries, etc. And yet it is absolutely necessary to plant certain varieties of each and every kind of fruit trees, if success is obtained.

RICHARD THURSTON.

Northumberland Co., Ontario, July 4.

SEEING accounts of the crops from all parts of the States, I thought I would give you some from Canada. Fall wheat is looking splendid and beginning to color. Clawson is looking the best. All varieties have rusted somewhat. Of spring wheat, the greatest amount I have ever known has been sown. It has been injured some by the fly but is generally good. Of barley 50 per cent less has been sown; injured some by frost, but still a fair crop. Hay is good, potatoes looking well, but the bug crop is looking better than I have ever seen it. Potatoes will be destroyed if not attended to. We have had very hot weather for the last week, the thermometer ranging from 80 to 90 in the shade to 120 in the sun. We have several varieties of spring wheat sown. Pringle's Defiance looking splendid.

JAMES FORD.

PITCHER, CHEN. CO., N. Y., July 7th, 1878.

THE weather here is dry and warm. On July 3d we had a very peculiar shower. Two miles north of us, they had the heaviest shower of the season. Clouds stood nearly still, and poured for nearly three hours. It rained a little here, while a short distance south, the sky was clear. The warm weather of late has changed the size and complexion of corn very much. Potato bugs are extremely plentiful, and the warmer the weather the better their appetite.

L. W. S.

HIGGANUM, Conn., July 9.

IT has been very warm and dry up to the 4th, when we had a splendid rain; we had another heavy shower to-day. Rye and oats are looking well and promise a heavy yield. We have a fine crop of hay. Farmers in this section cut their grass very late. We will have a fair crop of apples, but not as good as two years ago.

L. C. M.

RURAL GROUNDS, July 13.

FOR these grounds we are having too much rain, though in sandier soil, a mile distant, the weather is just what is needed. We have just completed setting out Celery plants and late Cabbages.

BOTANIC GARDEN, CAMBRIDGE, MASS., July 8, '78.

WE are having very warm and dry weather. Maximum temperature, 92° to 97° in the shade. Grass and shallow-rooting plants are suffering badly. Strawberries are about used up.

W. F.

PASADENA Co., Cal., June 26.

WE are having very fine weather now. Barley crop below average; corn looks splendid; will have a good crop of peaches, apricots, nectarines, and apples &c.

P. W. HOLLINGSWORTH.

THE
RURAL NEW-YORKER.
PUBLISHED EVERY SATURDAY.

Address
RURAL PUBLISHING CO.,
78 Duane Street, New York City.

SATURDAY JULY 20, 1878.

MANY of our old subscribers have written to us requesting that we would sell them the Cricket Clock. Others have complained that the offer (now withdrawn) was of advantage only to new subscribers. In order to satisfy all so far as we are able to do so, we have now the consent of the manufacturers of the clock to offer it to our subscribers—*and to them only*—until the 20th inst. at $1.75 each, delivered to the express office.

WE desire to make our respectful and very sincere thanks to the friends of the RURAL NEW-YORKER, for the support they have rendered us during the present year. Our success is simply beyond our expectation. We shall have no excuse whatever to offer if, for the last half of the year, the RURAL should prove, in any respect, inferior to what it has been during the first half.

WE offered, some time ago, to sell the cuts used in this Journal for ten cents the square inch. Many have requested us to send proofs of our cuts. As we have upwards of ten thousand, we could not undertake to do so. Persons wishing to purchase, must select from files of the RURAL NEW-YORKER.

WE have concluded to issue our index annually for the future, and to give it more care and elaboration than heretofore.

SANITARY PRECAUTIONS.

AMONG the sanitary precautions which should be observed in summer time, especially by those resident in country places, perhaps none is more important than that they should breakfast before going out to work in the morning. Compliance with this rule is particularly beneficial in newly-settled districts, on flat-lying lands, on all river bottoms, and wherever vegetation is rank and of rapid growth. In early morning science and experience alike prove that the mischievous ingredients of the air are particularly active, while the human system is unusually lax and debilitated and proportionately liable to be injuriously affected by noxious atmospheric influences, a liability greatly lessened by the bracing up of the system produced by an early breakfast.

In all places subject to miasma some of the settlers die yearly of it, while others live to a ripe old age, and an examination of the causes leading to these very different results, will, in almost every case, show that an early breakfast holds probably the most prominent place. The Creoles of Louisiana, like the old settlers in Florida, rarely venture out of doors in the morning, in summer time, before taking at least a cup of strong coffee with biscuit or crackers; the traveler foolish enough to venture before breakfast across the miasmatic Pontine marshes near Rome, is pretty certain to die in a few days thereafter, whereas if fortified with breakfast, he may make the journey in safety.

A few other brief hints on what one's conduct should be in warm weather may not be out of place. Keep the head cool in the sun, by placing in the hat a cabbage leaf or wet cloth; after work, change the sweat-moistened clothing, and invigorate the system with a daily bath. Avoid all carbonaceous, or heat-producing food, such as fat meats, butter, sugar etc., and eat liberally of vegetables, such as spinach, melons etc, as well as of ripe fruit, while eschewing carefully that which is unripe. In bathing be careful to put cotton or some other substance into the ears, for frequent injury to the hearing and sometimes permanent deafness result from diving without such precaution. Keep the bowels open by a mild aperient, such as Turkey rhubarb, Epsom salts etc; and it would also be well to keep on hand some diarrhea mixture. Keep cool in body, and especially keep cool in temper.

A friend seeing these lines, remarked that he thought ninety-nine out of every hundred readers never acted on such advice. "In that case" was the reply, "the article was written for the sensible one."

A SERIOUS CONSIDERATION.

THE most formidable argument against war, sulphurous Fourth of July celebrations, and any event that is accentuated by the combustion of gunpowder, is the absolute, irrecoverable loss of nitrogen, or food-producing power.

It is said, on the authority of science, that the production of one hundred thousand pounds of gunpowder annually, is equivalent to the destruction in advance of five hundred thousand pounds of bread. We believe the production is really one hundred million pounds, which adds, of course, three ciphers to the total amount of the waste of bread.

Gunpowder contains about seventy-five per cent. of saltpeter, which is equal to ten and two-tenths per cent. of combined nitrogen. Of this, nine and ninety-eight one hundredths, or about all of it, escapes in the form of free nitrogen, and is hence rendered useless. Therefore, every ounce of powder used destroys a certain quantity of food and makes it more difficult for the Micawbers of life to exist, as the chances for something other than starvation turning up, are very meager.

A war not only quenches the vital spark of many useful lives, but destroys the chances of existence of generations to come.

To put it in a homely way, we will say that if mankind buried five hundred million pounds of food in the earth, they would, of course, be guilty of heinous waste, but the nitrogen contained in it would still be of use in the future: if, on the other hand, they burn one-fifth as many pounds of gunpowder, they really commit a shocking crime, as they permanently diminish the amount of food the earth is capable of yielding.

This is a serious consideration and should give pause to the more warlike spirits, while furnishing a brilliant argument to the Peace Society.

NOTES.

Poultry on a large scale.—Like everything else, poultry requires to have common sense used in its management. There is common sense in a few hens being kept by any man living in a city and having a small yard at the back of his house where perhaps he has a stable with a pair of horses, but there would be folly in his having great numbers. There is good common sense in having a fine lot of fowls running around every farm homestead, but none in keeping so many as to bring on disease. There would be common sense in placing 1000 hens in families of 50 over 200 acres, giving them full liberty to range where they pleased, and and having their roosts so constructed that a yoke of oxen or a pair of horses could be hitched to them and haul them to a new site when crops growing near required the absence of the poultry, or when a coop had been a good while in one place, and the surroundings were becoming saturated too much with the manure. On a large farm with springs and running streams of water, 10,000 might be kept, by persevering attention in moving when necessary, and by plowing some ground all the while, near the fowls, and also by planting patches of rye in September to give them green food through the winter, which would be available whenever the snow is not lying thereon. But it would be folly for 10,000 or only 1000 to be kept confined on a few acres, and expect anything but disaster. With ample range fowls will be healthy in small families and require little besides what they will find by foraging, at the same time they will lay eggs enough to make $2 per hen; but confine them on a few acres and they will eat double of purchased food and lay not more than 75 cents' worth of eggs per head in proportion to the close confinement.

Give Your Girls a Chance.—Experience is a valuable part of an education. Girls should early learn to purchase materials for their own clothing. Parents can advise them at the start, but it will be a good plan for girls to learn to rely on their own judgment. The purchases can be talked over after they are made. Let your daughter, with a little advice, cut up a few yards of calico and make aprons and dresses, bed-quilts, even if there is a little waste and some poor fits. She will be likely to see her own mistakes and profit by them. Let her make some cakes and bread, and broil some meat and pop some corn, no matter if she does have to throw some into the swill pail. It is better to make a few small mistakes while young, in acquiring an education, than to grow up without experience. They must learn some time, or make great blunders during a good portion of their lives, when left to rely on themselves. In many respects, children are not trusted enough. They are "bossed" too much.

Renovating old pasture.—Pasture fields in the South as well as the North have most of them been exhausted before being grazed, the owners having grown cotton, hemp, tobacco till the fertility was all extracted. It is absurd for farmers to talk or write about the merits of such soil as pastures, and all the arguments about such land paying for stock-raising, dairying, or fattening mutton or beef, is nonsense. Good meat, butter, wool or stock of any paying kind, must have rich, fat land to feed on; but whenever farmers' possess a tract of land in every way adapted for permanent pasture they can't resist the inclination to plow, cultivate, and extract all the plant-food, and then having seeded to timothy as the chief grass and after having boasted of the fine meadow obtained, in two or three years they come to the chemist or agricultural press to know how to renovate the land.

Virginia and other Southern States.—On account of the winters being so short in the South, there is a great advantage in the less expense in sheltering and feeding stock, and whoever could take capital enough to buy a good variety of female animals at a cheap rate and purchase first-class, pure-bred males, might rest happily assured of success. In the horse department alone a fortune could be made; for on a farm of 300 to 400 acres, three-fourths original Blue-grass; in addition to cattle and sheep a fine stud of mares, all in their prime for breeding, could be bought so as to produce annually 30 foals which would sell at high prices and cost a mere trifle in raising, as there need be no expense for grooms or attendants of any kind.

High Cultivation.—We speak of "high cultivation" as weakening to plants. Thus the strawberry disease lately brought to examination by the Messrs. WILLIAMS of Mt. Clair, N. J., is said to be induced by successive "high cultivation." What harm can it do? If a man eat and drink too much, dyspepsia, gout, "nervousness," or a general breaking down, is attributed to "high living." Strawberries, by many of our propagators, and especially by many of those who have new "Hybrid Seedlings" to sell, literally gorge the soil in which they are planted with all sorts of manures, both barn-yard and commercial. Are not such plants "living too high?" Mightn't the "Brown Strawberry Rust" be to the strawberry plant what dyspepsia, gout, "nervousness," or a general break down is to the man plant?

Discriminating Wages.—Every farmer knows that some hands are worth more to him than others. Nevertheless, especially in busy times, he finds himself obliged to pay all alike. The effect has been that of "leveling down" instead of "leveling up," as Mr. CURTIS expresses it, thereby destroying that energy and spirit which, in some men, are natural. It is no matter of surprise, therefore, to find our hired farm hands moving about like turtles, and extremely ingenious in making a parade of diligent work stand in lieu of labor that may be judged by its results. Such is the tendency of rewards that do not discriminate between the good, bad, and indifferent.

BREVITIES.

GIVE the poultry shade.

TOMATOES are good for chicks.

STEAM cultivation is rapidly extending in England.

THE Agricultural Gazette (London) gives a picture of a Devon bull belonging to Viscount Falmouth, and the bull's name is "The only Jones."

SAMUEL RUMPH, of Marshallville, is credited with producing the first ripe Peach this season. The date was the 10th of May, and the variety the Early Am[illegible].

WHEN new feathers come out, the old ones fall from the wings which are not willing to carry them any longer, and afterwards the bird flies so much the better."—*Liebig.*

MR. R. B. PARSONS thinks that a commission to obtain better acquaintance with our climate and soils, and the wants of tree-growing in this country, would be better than sending a commission to Europe.

IT may be well to remind persons agriculturally inclined, who contemplate visiting the Paris Exhibition, that M. Ville will receive all who are thus interested up to August 1st at his laboratory, 48 Rue de Buffon.

WE have several times imported Melon seeds from England. Whether they are not so fresh as our own or those purchased here, or whether the sea-voyage harms them, we cannot say. But certain it is they are slower to germinate, and the present season many (seeds of mush-melons) have not germinated at all.

THE flowers of Catalpa syringæfolia, now blooming, are white, striped with purple and "splashed" with orange. They are borne in panacles nearly a foot in length and the trees present at this time a beautiful appearance. The flowers remind one of Orchids.

ASPARAGUS beds are very often neglected after cutting is done. But they should be kept free from weeds and a strong growth, upon which their next year's value depends, be insured by liberal top-dressings of manure. An application of liquid manure and salt at this time would prove of great service to beds which are not fairly vigorous.

DR. STURTEVANT says: "One of the best results which could happen to our talking agriculturists would be to sweep from existence the idea that cheap results can be of other than of cheap value. The true results are always costly of time and of thought. Let the agricultural thinker receive recognition, in accordance as his thought is based on facts."

AT the Nurserymen's Convention, speaking of the advisability of appointing a committee to confer with railroad agents for the purpose of obtaining lower rates, Mr. Robert Douglas remarked that little could be accomplished by conferring with the railroads. On common roads he has always given half of the way, but if walking on railroads he always gives the whole.

MR. COX, a Minchinhampton farmer, says: "Many of us have been committing a great blunder in causing our manure heaps to decay too fast; we want it to be too soon soluble; yet we sometimes let it remain a whole year after it has become soluble, and feel proud to have a good heap of 'two-year-old dung.' I think many who keep their dung to get old are picking their own pockets."

A LADY of our acquaintance had it in her power to render a service to a stranger who, it afterwards appeared, was a rank Communist. He thanked her and vanished, but quickly returned, and drawing from his pocket a card with a name written thereon in blood-red characters, handed it to his benefactress with the assurance that when the revolution began that card would protect her from the attacks of infuriate communists. How awful!

GET READY.—By all means, whatever you undertake make a deep, broad foundation, and, with good health, energy, and continued effort in some one direction, success is sure to come sooner or later. It may not come as soon as you would like. It may not be apparent till the coming of gray hairs, but honest toil hurts no one while it benefits all, both those who participate and those who are looking on. It is the last part of a thorough training which pays the best.

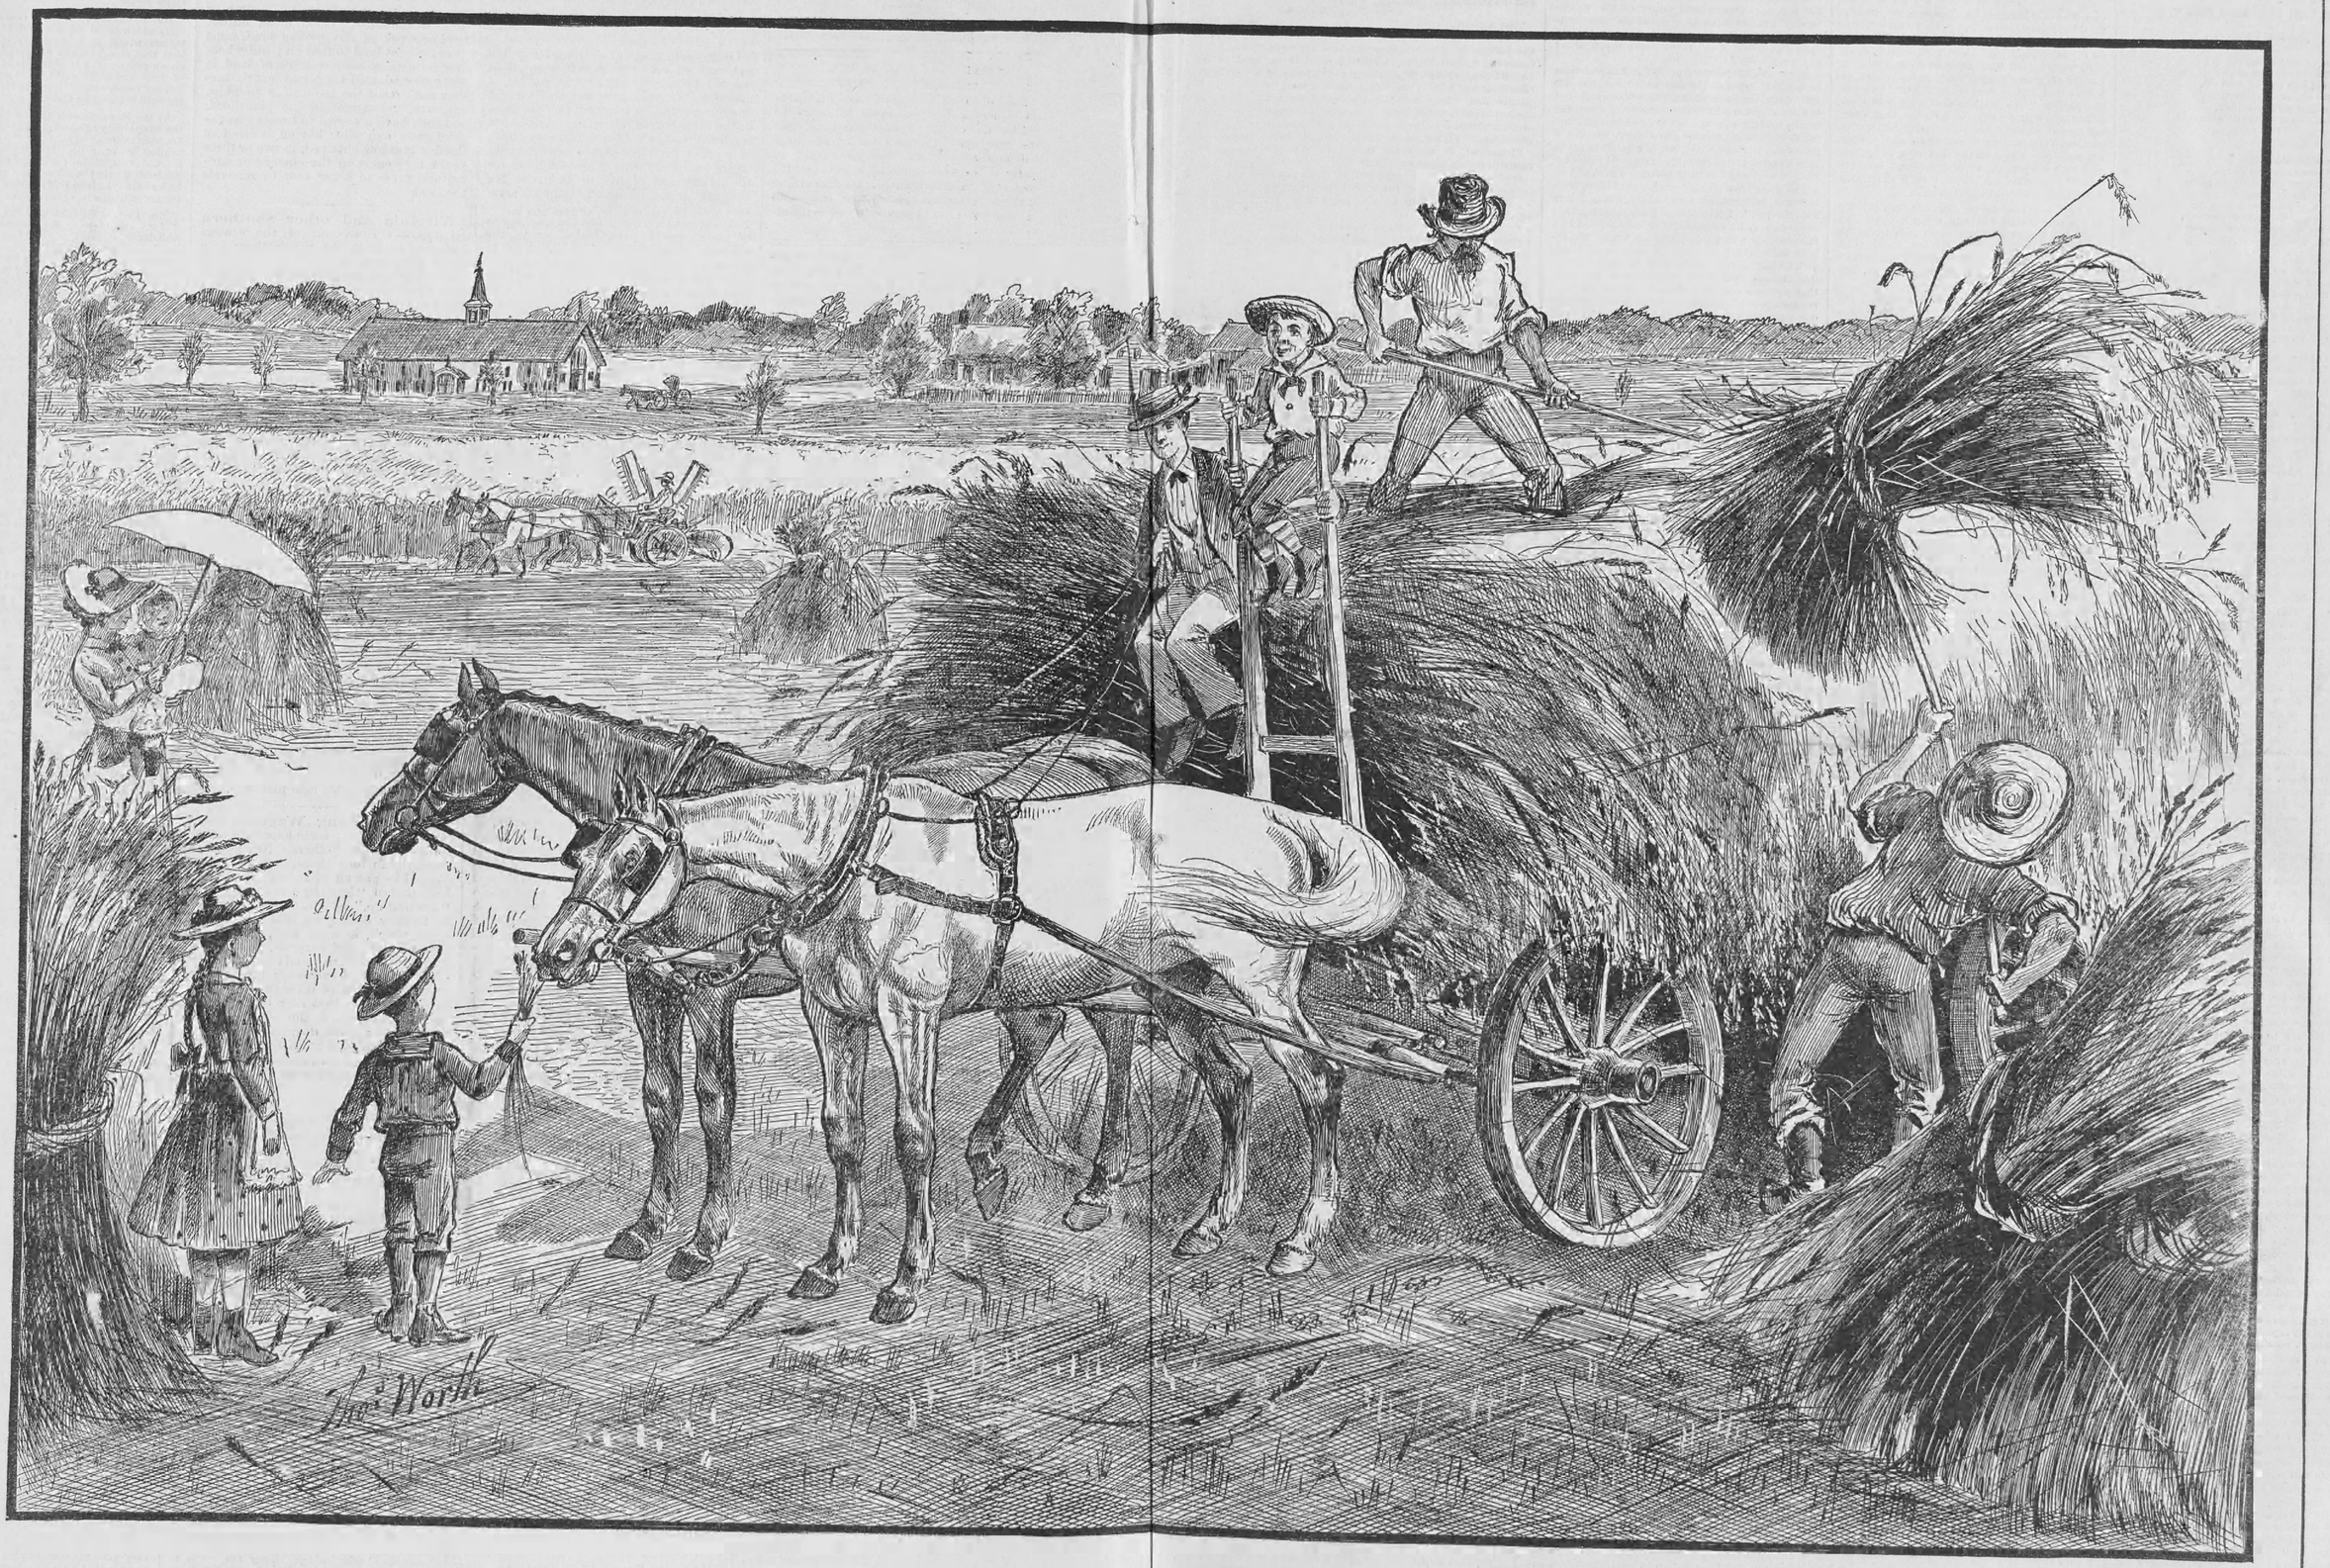
AN experienced farmer says: "The only plan I can suggest to the man who has not been brought up a practical farmer, is to be in the yard before his men go to work in the morning. Put every man to his intended work quietly and agreeably. See that every horse is placed to the right implement, and every implement in its right place, so as to do the best and greatest amount of cultivation with the fewest men and horses.

"Be on the farm as much as possible, and see that two men don't get to a job that one can do."

KEEPING WHEAT AND OTHER GRAIN.—Difference of climate has a good deal to do with thrashing and selling grain at harvest or immediately after. In England more than half the grain of all varieties remains in the straw unthrashed till the next spring. Oats are never put in barns at harvest; they are stacked, very neatly and carefully thatched by a professional laboring thatcher. Wheat, barley, beans and peas also are chiefly put into ricks and thatched, remaining till, stack by stack, they are required to be thrashed for the straw quite as much as for the grain, excepting where capital is short.

AMONG several notes kindly furnished at our request by Mr. J. J. MECHI, the well-known owner of Tiptree Farm, England, is the following: Said my wife to-day, "your wheat is too thick," and I had to remind her that she had said so years ago, although I only drill 4 pecks to 4½ pecks per acre, and when it first comes up, the thin lines are complained of as being "much too thin." How they have thickened by branching this spring! Surely there never was a better prospect for a crop so far—so warm was the ground from sunshine (despite the piercing winds) that this morning a dewy rain on fresh plowed ground was a bed of dense steam for half an hour. If we observed how many juvenile weeds we destroyed in a day's hoeing, we should congratulate ourselves upon the profit of the operation. My wheat is drilled at intervals of 9 inches from row to row. It is evident that abundant sunshine has so warmed the soil that all crops spring up quickly and grow healthily. A warm, dry May, will "do the needful," and strengthen our convictions. The prospect for a full hay crop is very comforting for the occupiers of permanent pasture. I have only 6 acres. Essex farmers are (with some exceptions) careful hoers of wheat. If the weeds are removed before the wheat closes in, they have little chance afterwards. All my land is under crop now, except about 2½ acres to be drilled shortly with kohl rabi.

FARMING AS A MIXED SPECIALTY.—As commonly pursued, mixed husbandry is usually a coarse business, unless the man possesses extraordinary ability in many directions. To keep a model farm and thrive, he must be something of a mechanic, a gardener, a stock breeder, a trader. He must have an eye to the beautiful and keep things in good order and well picked up. We do not mean that fancy farming is profitable, or that any one should be advised to follow it, for this has been repeatedly shown to be unprofitable. There is, or may be, a wide difference between fancy farming and farming where everything is neat, orderly and well done. In agriculture our ideal is a mixed specialty. By this, we mean that a man may be engaged in general or mixed farming, and at the same time give especial attention to some one department. He will select something for which he has a decided taste, as horses, some breed of cattle, sheep, swine, poultry, bees, raising and improving seeds of some grain or grass or vegetables, or raising fruit, or in some other produce. This specialty will give him interesting study, and he will likely feel gratified in becoming quite proficient in something, while if he divided his energy about equally on all departments, he could not become very proficient in any of them. A specialty alone makes a man narrow, while the broad field of agriculture gives breadth at the expense of depth and finish.



SCENE NEAR THE "RURAL" FARM.—Drawn by Thomas Worth.

Literary Miscellany.

ERE THE SUN GOES DOWN.

JOSEPHINE POLLARD.

I HAVE work enough to do
Ere the sun goes down,
For myself and kindred too,
Ere the sun goes down.
Every idle whisper stilling,
With a purpose firm and willing
All my daily tasks fulfilling
Ere the sun goes down.

I must overcome my wrath
Ere the sun goes down;
I must walk the heavenly path
Ere the sun goes down;
For it may be death is wending
Hither with the night descending,
And my life will have an ending
Ere the sun goes down.

I must speak the loving word
Ere the sun goes down;
I must let my voice be heard
Ere the sun goes down;
Every cry of pity heeding,
For the injured interceding,
To the light the lost ones leading
Ere the sun goes down!

As I journey on my way,
Ere the sun goes down,
God's command's I must obey,
Ere the sun goes down.
There are sins that need confessing,
There are wrongs that need redressing,
If I would obtain the blessing
Ere the sun goes down!

MARGARET'S VICTORY.

H. E. CLIFFORD.

"GOLLY!" Rather unceremonious for an introduction, but it was certainly expressive, coming from the lips of Johnny Edwards as he burst into the spacious kitchen of the old homestead one Saturday afternoon toward the close of December, 1874.

Just look at him, standing there in the center of the room, a ruddy-faced rough-handed farmer-lad of nineteen, his general appearance suggesting the possibility of a snow storm thereabouts.

"Neow John!" cries bustling Mother Edwards, as she steps from behind the pantry door, "Won't you men folks never learn to come in through the shed when it storms?" and with a doleful glance at the shower already strewn on the floor she quickly marshaled him out of the pleasant room.

The table is spread for the evening meal, and company must be expected, for mother Edwards has out her wedding set of china and her modest array of silverware.

The good farmer has gone to the village, a few miles down the valley, on his usual Saturday afternoon trip, and, standing at one of the windows, is a young girl awaiting his return. A slender figure, slightly above medium hight, rich brown hair, falling a wavy mass over her shoulders, a sweet, pale face with large clear eyes, give the girl claims to beauty of no mean order.

Margaret Martyn, for that is her name, is an orphan. Ten years before, she was a little match-girl, wandering to and fro in the busy streets of the great metropolis, with scanty clothing and tattered shoes, and her long brown hair only a tangled mat about her face. Thus she appeared to honest farmer Edwards, as he strode down Chambers Street toward the Erie depot at the close of a visit to the New York market with his yearly invoice of butter and cheese, and the sight so touched the warm-hearted man that it took but brief inquiry to satisfy the farmer that it would be no sin to transplant the frost-bitten little daisy from this sterile atmosphere to the more genial climate of his homestead, among the hills of B—— County. Mother Edwards remonstrated with surprise when, twenty-four hours later, he led the trembling little waif into the broad kitchen, but the farmer said softly, "Mother! 'Inasmuch as ye have done it unto one of the least of these, ye have done it unto me;'" and it was enough. The good wife opened her heart and home to the young stranger, who is now the sunlight of the household.

She has stood for half an hour looking out upon the snown storm, and it is a storm indeed, whirling, dancing, tumbling down. Sitting in at the casement, circling round the chimneys, banking up the door-way, piling on the porch—there is no noisy patter on the window pane; no boisterous roaring of the storm-king—no fitful dashes and calms as if the effort were too great for nature's endurance, but it falls

"Soft and pure as an Angel's wing
So gently shrouding everything
Pearly, beautiful snow"

Suddenly a restive span of grays dashes up to the door and farmer Edwards unloads sundry mysterious bundles and budgets that bespeak the near approach of Christmas time, and see! here enters the expected guest, closely followed by the farmer crying "Mother, Maggie, where are you all. Here's Nevey Elliott, my sister's boy." And a cordial welcome "Nevey" Elliott received from mother Edwards, and a shy glance and smile from Margaret as she gave him her hand, when the farmer introduced her, by saying, "She's our 'dopted daughter." Then, after having hung his great coat on its accustomed peg and deposited the fringed mittens on the clock, he stood warming his hands and rubbing them together in his quick, good-natured way. mother Edwards bustled about in eager haste to prepare the evening meal, and the cheerful "Come father, supper's ready," was answered by a general rally around the table.

George Herbert Elliot, the guest is not a handsome man, but there is something attractive in that full, noble brow, with the curling locks of dark hair, brushed carelessly back, and there is a good look in his large, dark eyes, but, his face is a little too thin for perfection.

The twenty-five years of his life (or at least that part of it since his freedom from school-day thraldom) have been passed in his father's counting-room—one of those dingy, wholesale houses on Washington Street, New York, where from early morning till long after business hours, he labored unceasingly over the tiresome pages of journal and ledger. The old rule "business before pleasure" was the standard he forced himself to follow till he began to realize that even his strong constitution was failing under the continued strain of nerve and brain and it took but little persuasion on the part of his mother, who with a woman's quick perception saw his need of rest, to induce him to take a short trip to his uncle's home in the country.

"Well, Well! George my boy, you ain't so little by a foot or two as you was when we saw you last," said farmer Edwards as he rose from the table and led the way to the best room, then speaking half to himself he added "but there's no use in living if you can't grow somehow, not a bit, my boy, not a bit."

Already Elliott began to feel that he had entered a new atmosphere, and the change was alike pleasant and novel. The quaint stories of the old farmer, and the curious questions of Mother Edwards about City life, amused and interested him while he did ample justice to the nuts and apples, which, with a brimming mug of cider, were served by John. But the greatest charm of the evening was Margaret. He fancied that Margaret in her modest suit of gray, was more lovely than the belles of Fifth Avenue: and although he numbered among his friends some who were musicians, he had never heard the charm in their artistic productions, that he found in the old ballad songs which Margaret sang, accompanying herself on the cottage organ. He did not fall in love, he had too much self-respect for that; but after he had been shown to his chamber and was comfortably quartered in the old-fashioned rocker before the open fire, enjoying his favorite Havana as he dreamily watched the blue rings of smoke fade into space, he said to himself. "On the whole, I think I rather like my little country cousin."

Next day was the Sabbath, just such a Sabbath as so often follows a Saturday's snow storm—calm and beautiful. A blessed quiet reigned over all, broken only by the cackle of the plump Cochin Chinas, as, pacing to and fro behind the windows of their tidy quarters, they bade defiance to the winter chill; or the shrill piping of the Bantam cock, whose energy makes up for all deficiency in size; and now and then the dull lowing of the cattle in the farm-yard, or the distant barking of a watch-dog. This quiet Sabbath seems to pervade all within the Edwards homestead; the bountiful morning meal had been prepared and eaten, the house set to rights as if by magic, the chapter read, the good old hymn sung, and the earnest, heartfelt prayer of the farmer most reverently said, not forgetting to crave a blessing for their guest. All this was new to Herbert Elliott; it seemed a strange transition in a few short hours from Bedlam to Eden.

Margaret, having finished the needful household tasks, was seated by the window with an open book before her. She had asked Herbert the evening before if he liked poetry, and he, though admiring the standard writers, found no pleasure in the class of sentimental rhymes that flood the drawing-rooms of the city, and so had answered: "I scarcely know, Miss Martyn. I have very little leisure to enjoy it, and then, you know, poetry, to be appreciated, must be heard or read aloud, and I have no companion." Now, as he entered the room, she extended her hand, saying: "Come, cousin Herbert, let me be your companion while we read some poetry." Advancing to her side, he saw she held a copy of Whittier, and, turning to "Snow-bound," she said: "Now, I will read, and as you listen, look from the window, and tell me if it is not a glorious description of the scene before us." He had often read the lines before, yet he never fully realized their beauty till his eye wandered over the snow-clad landscape while she read in a low sweet voice. It would be difficult to guess how long he would have remained lost in day-dreams, had not the spell been broken by Margaret, whose quick ears caught the sound of the village church bells, soft and clear in the distance, calling the thoughts from created beauties to the praise of the Creator; and when, half an hour later, John drove to the door with the long red sleigh, all were ready to step in. The farmer, with his great-coat buttoned to the chin, cheerily helped mother Edwards to the front seat, and insisted on seating Herbert, or George, as he would always call him, beside Margaret.

The ride, though short, gave time for a slight interchange of thought, which our young friends did not neglect, and it is to be feared the wholesome teachings of the good old clergyman did not meet with the usual appreciation from Margaret on this pleasant Sabbath morning, for other thoughts claimed her attention. The waters were being drawn from the deep-hidden well of the soul and spreading a fresh verdure over all her life.

"Two tides of the infinite ocean,
That chafeth the shores of Time,
Two waves of the passionate sea of life,
Have mingled their mystic rhyme—
And the holy music goes echoing up
To the peaceful courts above,
And the song is a song with an old refrain.
And the rhyme is a rhyme of love."

To Margaret there was something sacred in this companionship of thought and heart. Although she had kind friends ever near, and a pleasant home with the comforts and luxuries of life at her command, there was still something lacking in her life. It could not be admiration or praise, for these she received at every turn; and could it be love? Why! did not honest John Edwards love her, to use his own expression, "like all tarnation," and there was William L——, who told her only last summer, that "for her sake alone" he cared to live, and more than that, did not the handsome, young editor of the village Gazette whisper softly to her that his "best articles" were written when thinking of her,—surely here was love. What more could the heart of any woman wish?

Margaret had treasured up all these experiences in her memory and thought over them, but not with quite the same interest that was awakened one evening when Elliott and she were returning from a skating expedition, that had brought the ruddy glow to her cheeks and a merry sparkle to her eyes. Herbert took both her hands in his as they stood in the moonlight, saying, "Little Coz, you are so pretty I can't help liking you, and you are so good I can't help loving you;" then, hesitating a moment, he softly added, "May I love you, Marjie?" There was a quick, timid glance at his face and a little quiver of the lips, and in a moment she was gathered to his arms. Mr. Elliott still held her hands as they walked on, and, in fact, conducted himself in such a lover-like manner during the remainder of his visit, that nothing but our knowledge of his previous resistance to all attacks of cupid would prevent one suspecting it of being really a case of love, which, of course, no one would believe of the sedate Herbert Elliott.

Time, which tradition says waits for no man, declined to tarry even for Herbert Elliott's pleasure, and so the limit of a month's visit was reached.

It was the evening before Elliott's return to the weary routine of city life, and he had retired to his chamber early, to hold another of those soliloquies, induced by an easy-chair and a favorite cigar, in the charm of the fire-light. More than once during the past week he had sat thus for hours, while a struggle was going on in his heart. Whenever he thought of Marjie (by her request he called her Marjie instead of Margaret since the evening of the skating party), and every time he thought of her and spoke the name softly to himself, something seemed to say, "Herbert Elliott, you love that little woman, and cannot be happy without her," and as often he would strive to crush such thoughts; but this night they came with unusual earnestness, and for a long time he allowed himself to picture a future of radiant and bright possibilities,—then, recollecting the stern realities of life, he put away the tempting visions saying, "No! I have no right to bind the guileless heart by any vows, before it has learned that there are souls more noble, and lives more true than mine has been. Other men will love, perhaps, as fondly, and offer fortunes more ample and hearts less blighted by the world than mine. The strongest proof of love is sacrifice, and while it would be a stronger incentive to action than I have ever known, to feel that the hope and happiness of this young life were in my keeping, I will ask no troth, for, God knows,

"I'd rather weep to see thee free,
Than win thee, to destroy."

No! Marjie,—though your image is engraven on my heart, and the blessing of your influence will be ever present with me, there shall be no pledge till I have proved more worthy of the trust, and, if meantime another wins your love, no one shall ever know that Herbert Elliott has loved and lost; but if we meet again, and you are free, and still have faith in me, then—but I forget the thousand mischances that lie between—the strange, wild currents in life's sea are uncertainty itself. There is but one plain path before you, Herbert Elliott; it is to be a true man worthy of such a prize. It is enough that God knows your love, your hopes your fears; the future is with Him, and 'He doeth all things well.'"

This logic governed the conduct of Herbert next morning, when, with a delicate tenderness, he turned from the hearty "Good-bye" of mother Edwards, and taking Margaret's hand said, "I'll not forget you, Cousin Margie. I'll write to you sometimes, and if you'll send me word when the daisies blossom, and the strawberries begin to ripen, perhaps I'll come again." There was a slight pressure of the trembling hand, a quick glance into her eyes, and he was gone.

Farmer Edwards remarked at dinner, "It seems wrong to see George's chair empty;" and mother declared, "He seemed as much a son as John.' Which affectionate comparison the aforesaid John considered a great insult and heartily hoped, "The feller had got enough country to last him ten years," but Marjie said nothing.

Thus the days and weeks and months passed, and the visit of Herbert Elliott was remembered only by an occasional remark in the Edwards family, unless a deeper memory remained with Margaret.

Quite often there came to the village post-office a letter addressed in a bold, plain hand to, "Miss Margaret M. Martyn." At first they came in large business envelopes, printed across the end: "Return to Elliott & Co., Wholesale Grocers, No. — Washington Street, N. Y.;" and it was amusing to see how deliberately the old postmaster would turn them around and read this and then give Marjie such a reproachful look over his spectacles when he handed it out to her; but as time passed they came in neat little white envelopes, bearing a monogram in blue and gold which looked strangely like "E. & M," but of course was not, for that would have been very suggestive.

The blowy days of March have given place to showery April; these in turn are followed by the flowers of May, and even May is almost spent. Mother Edwards says she "Can't imagine what makes the girl go walking in the south meadow so often now-a-days." A random guess would be that she was watching the strawberries; at least she came back one day with a triumphant gleam in her eye and a stem of ripened berries in her hand, and there was a light in her chamber that night till after twelve o'clock, and lying before her is a small white envelope addressed to "G. Herbert Elliott, Esq., No. — Washington Street, New York."

"WOODSIDE FARM, May —, 187."

COUSIN HERBERT:—The daisies are in blossom, and the strawberries are ripe; will you come?
MARJIE."

That was all.

Next morning Margaret rode to the village with the farmer to do some shopping, but for some cause she seemed to forget about it when there, and did none except to purchase a few yards of ribbon for her hair, of the shade Herbert used to admire; but where was the wonderful letter? she has taken it to the depot, and when the train arrived, placed it in the hands of the gentlemanly postal-agent saying, in a timid, pleading way, "Please, sir, do not delay it." Then she was ready to return home and—wait.

Just at dusk, three days after, a quick rap at farmer Edwards' door announced the arrival of a guest, who proved to be none other than Herbert Elliott.

"Unexpected, but always welcome," mother Edwards said, and secretly she wondered why Marjie was not as much surprised as the rest of the family.

It was "only a flying trip," he said, "to see if they were all well," and while he no doubt felt some interest in the family, he certainly spent very little time in looking after their welfare, and devoted himself almost constantly to Marjie. Every day he would be seized by a sudden desire to visit the lake, or the strawberry meadow, or some pleasure resort in the vicinity, and it generally occurred—by accident, of course—that he chose a time when the rest of the family were too busy to go, and therefore Miss Marjie must be his companion.

One Sabbath afternoon they had been singing and talking together till sunset; then mother Edwards missed them, and, marching out on the porch, where the farmer sat dozing in his easy chair, with his glasses nearly slipped from his nose, and the family Bible open upon his knees—she placed her arms akimbo—a position only assumed on very extraordinary occasions—and said: "Now, look here, Henry Edwards, if that nevey of yourn' has any notion I'm goin' to see him coaxin' our Marg'et right away from us in this style, and not tell my opinion on it, he's mightily fooled."

"Tut, tut! Mother, don't be foolish, now," said the good farmer, as he gently took her hand and led her back to the west window, then parting the screen of honeysuckles, he pointed to the lovers, as they walked hand in hand across the lawn to their favorite seat under the maples, and said: "Do you forget, Mary, when we, too, walked the same path in the twilight?" and as she looked, her head sank upon his shoulder, while an expression of tenderness came into the faded eyes, and she forgot her anger in a tide of olden memories that came over her, laden with scenes from her own younger days, and she answered, slowly: "That was a long time ago, Henry." "But have you ever been sorry?" he asked; and her answer was a loving pressure of the toil-worn hand and a kiss on the wrinkled cheek, that for fifty years had known the salutation of no other lips; then, blushing with confusion, she hastened away.

Marjie is seated in a rustic chair, and Herbert by her side. Bending over her, he said: "Marjie, all the beauty and brightness of this world to me, and all my hopes for the future, rest on your answer; is it yes, or no?" A low murmured "yes," and he took from his pocket a little casket, which on opening, disclosed a slender ring—a diamond supported by two hearts—and, placing it on her finger, he whispered: "Darling, mine at last," as he knelt to imprint the first kiss of betrothal on her virgin brow.

Next morning there was another farewell on the front porch of the homestead, but it was slightly different from the scene six months before, and mother Edwards, with a watchful care toward the future, dropped a few well-directed hints, that the idea of her ever giving up her "Marg't" was preposterous in the extreme.

October has arrived, and at the Edwards' farm everything seems cheery and home-like The tea-kettle sings merrily on the stove in the kitchen, and the table is spread in the cool shade of the porch, the great Maltese cat lies stretched full length in the open window, and the canary hops gayly about his Gothic cage;—but there is a cloud on Marjie's brow! her face is sad, and the firm lips are compressed as if to smother a groan. Those letters, with the New York postmark, have been irregular of late, and none at all for two weeks past; and the last ones were so cold and forced—so filled with business—the state of the markets or the depression of stocks, and such matters as she could not understand; besides, there is a new sorrow to-day. It is Marjie's birthday—eighteen to-day,—and Herbert promised on that June evening, under the maples, to pass this day with her, and now the day is almost gone, with the promise unfulfilled; but listen! there is a foot-fall on the porch; can that be Herbert? It is, but how changed! he looks five years older than when we saw him last; there is a wild, uneasy light in his dark eyes, and while he greets Marjie cordially, he does not meet her gaze with the full, frank look of old; he seems abstracted, falls into reveries, and starts up suddenly, looking around as if he thought some one was watching him. His interest in the quaint, old songs seems lost, and the interviews with Marjie are always hurried. Sometimes he spends nearly all night writing—"business of importance," he says, and once he was gone all the day and evening, and returned, acting more strangely than ever; and, before a week had passed, a telegram recalled him to New York, and left such an aching void in Marjie's heart as she had never known before.

Through the dreary weeks that followed, there came occasional letters from Herbert; but they were short and disconnected, seemingly written more as a duty than a pleasure.—[Concluded next week.

BRIC-A-BRAC.

A STORY OF CHINESE LOVE.

THE festive Ah Goo,
And Too Hay, the fair—
They met, and the two
Concluded to pair.

They "spooned" in the way
That most lovers do,
And Ah Goo kissed Too Hay,
And Too Hay kissed Ah Goo.

Said the festive Ah Goo,
As his heart swelled with pride,
Me heap likee you—
You heap be my blide?"

And she, looking down
All so modest and pretty,
'Twixt a smile and a frown,
Gently murmured, "You bettee."

A PRETTY FANCY.

ONE of the pretty fancies of French people is to make colors the expression of sentiment. They hold that violet is analagous to friendship, blue to love, as suggested by blue eyes and azure sky. A bunch of violets would therefore tell a lady's suitor that friendship is all he has a right to expect. Yellow is paternity or maternity; it is the yellow rays of the spectrum which cause the germ to shoot. Red figures ambition; indigo, the spirit of rivalry; green, the love of change, fickleness; black, favoritism; white, unity, university. In addition to to the seven primitive colors, gray indicates power; brown, prudery; pink, modesty; silver gray (semi-white), feeble love; lilac (semi-violet), feeble friendship; pink, false shame.

GRAMMATICAL TAUTOLOGY.

I'LL prove the word that I've made my theme
Is that that may be doubled without any blame;
And that that *that*, thus trebled, I may use,
And that that *that* that critics may abuse
May be correct. Farther—the dons to bother—
Five *thats* may closely follow one another!
For it is known that we may safely write,
Or say that that *that* that *that* man writ was right;
Nay, e'en, that that *that* that *that* that followed
Through six repeats, the grammar rule has hallow'd;
And that that *that* (that *that* that *that* began)
Repeated seven times is right! Deny't who can.
—*Richard Grant White.*

TWENTY IMPOLITE THINGS.

1. Loud and boisterous laughing.
2. Reading when others are talking.
3. Talking when others are reading.
4. Cutting finger nails in company.
5. Joking others in company.
6. Gazing rudely at strangers.
7. Leaving a stranger without a seat.
8. Making yourself hero of your own story.
9. Reading aloud in company without being asked.
10. Spitting about the house, smoking or chewing.
11. Leaving church before worship is closed.
12. Whispering or laughing in the house of God.
13. A want of respect and reverence for seniors.
14. Correcting older persons than yourself, especially parents.
15. Receiving a present without an expression of gratitude.
16. Not listening to what one is saying in company.
17. Commencing to eat as soon as you get to the table.
18. Answering questions that have been put to others.
19. Commencing talking before others have finished speaking.
20. Laughing at mistakes of others.

THE owner of a house in Hartford, a widower, lived in the upper story and rented the lower part to a clergyman. A servant girl employed in the clergyman's family was young and pretty. Her mistress observed that she and the widower were devoting a great deal of attention to each other, and deeming the matter scandalous, said to her: "Pack up your things and quit." The girl obeyed; but on the following day she returned in a carriage, announced that she had been married to the landlord, and said to her former mistress: "Pack up your things and quit."

A FRENCH VERSION.

LA petite Marie had le june muttong,
Zee wool was blanche as ze snow;
And everywhere la belle Marie went,
Le june muttong was sure to go.

Oui, monsieur; von avez un very large imagination; mais comment est this, pour Deustche:

Dot Mary haf got ein leedle schaf;
Mit hair yust like some vool;
Und all der blace dot gal did vent,
Das schaf go like ein fool.

THE ingenuity of the Chinese is not confined to embroidery, ceramics, and decorative art, but extends to internal revenue. One of the latest schemes of the Celestial statesmen proposes a tax on new-born infants. The sum is ridiculously small—about ten cents—but as babies are one of the principal productions of the Celestial Empire, and the market is constantly overstocked, a handsome revenue from this source is confidently expected. The tax falls due when the infant enters the world, and the happy father, without delay, steps down to the captain's office and settles its passage. Strange as it may seem, there are no deductions in case of double entry. This is not in accordance with natural equity or customs of morality. The tax for twins surely ought not to exceed fifteen cents.

THE horse, bowed down by weight of woe,
To weakest oats will cling;
Nor whip nor spur can make him go,
Nor any other thing.

THE motto for lovers is, "E plural buss yum, yum!"

For Women.

CONDUCTED BY MISS FAITH RIPLEY.

SOME ONE'S SERVANT GIRL.

SHE stood there leaning wearily
Against the window frame,
Her face was patient, sad, and sweet,
Her garments coarse and plain;
"Who is she, pray?" I asked a friend,
The red lip gave a curl—
"Really! I do not know her name
She's some one's servant girl."

Again I saw her on the street,
With burden trudge along;
Her face was sweet and patient still,
Amid the jostling throng;
Slowly but cheerfully she moved,
Guarding with watchful care
A market basket much too large
For her slight hands to bear.

A man I'd thought a gentleman,
Went pushing rudely by,
Sweeping the basket from her hands,
Yet turning not his eye;
For there was no necessity
Amid the busy whirl,
For him to be a gentleman
To some one's servant girl.

Ah! well it is that God above
Looks in upon the heart,
And never judges any one
By just the outer part:
For if the soul be pure and good,
He will not mind the rest,
Nor question what the garments were
In which the form was dressed.

And many a man and woman fair,
By fortune reared and fed,
Who will not mingle here below
With those who earn their bread,
When they have passed away from life,
Beyond the gates of pearl,
Will meet before their father's throne
With many a servant girl.

TALKS ON TIMELY TOPICS.—No. 7.

ROSE GERANIUM.

Phantom Work.

EVERY lady, who delights in dainty home-arts, should have, as a companion for her wax-flowers, a phantom bouquet. The fingers which are skillful in the one will not fail in the other effort.

In July or August, when the foliage, at its rankest, is yet unimpaired, all conditions favor the undertaking. In making selections, choose from the forest those leaves which possess the strongest fiber—Poplar, Beech and Gum—are representatives. If possible, have in your collection our favorite, the Pear. Place oak or other leaves containing tannin, in a separate vessel. Gather only foliage free from imperfections, and procure a generous quantity, in view of many possible failures. In addition to these, we may suggest the seed-vessels of various wild and cultivated plants, of which the Poppy and Columbine are types.

If in your researches you chance to discover some heads of Wild Cotton, Asclepias or Thistles, carry them home carefully—you will find them treasures, suggesting their own sphere of usefulness.

Place your leaves in a tub, weight them down with a plate, and cover with rain-water. Let them remain in a sunny exposure for about two weeks, or until they hint of a stagnation more delightful to the artist's prospects than to her senses!

In that state of decay necessary to a removal of the pulps, the leaves, it must be confessed, have entirely lost their charm, and it is only the stimulation of hope which prevents the worker from throwing the mass away in disgust. However, we are ambitious and bravely proceed. Remove a few leaves at a time into clean water, gently rub them between the fingers or tap them with a brush, giving a downward motion. In handling them, float them upon a card or a bit of glass to prevent breaking. When the pulp is entirely removed, place the specimens in a vessel of clear water, and as soon as possible get them all ready for the bleaching.

An easy method is to prepare a solution of chloride of lime, which is made by dissolving one tablespoonful of the lime in a quart of soft water. Add six or eight grains of citric acid, dissolve, drain off and bottle. Place your specimens in a shallow dish, cover them with this liquid, and set away in a dark room for a day or two, covering them closely. When sufficiently bleached, place again in clear water, leave them for another day and then float them out; press gently between folds of soft linen until dry, and them shape them to suit the taste. Some may be pressed between surfaces and others gracefully curled, as in nature.

Before leaving the subject I will give a second method, employed by more experienced persons for destroying the epidermis of the leaf. This plan greatly hastens the operation, although it requires a greater degree of delicacy and skill in handling. It is as follows: Dissolve eight ounces of soda and four ounces of air-slacked lime in two quarts of water; boil and strain. In this solution place the leaves and boil for an hour or more, adding water to supply what evaporates. Remove a leaf and determine by experimenting when the pulp is sufficiently softened for work. The cleansing and preparation are the same in this as in the method first given.

The taste will suggest various ways of mounting to produce fine effects. If placed under a glass globe, a wax or an alum basket or vase, will be found a dainty receptacle. Group a portion of the smaller leaves into blossoms of various shapes, occasionally employing thistle-down or fine floss-silk for centers. The stems should be of fine wire, wound with white silk.

A box lined with white, frosted plush, forms another appropriate receiver; and they look no less lovely made into a wreath or cross on rich black velvet. A few silver spangles may sometimes be introduced with good success, but great care must be taken not to place with these ethereal treasures anything which would add to the effect the slightest degrees of heaviness.

A HOUSE HOLD REFORM.

J. E. M'C.

I WISH I could prevail on all farmers' folks this abundant, summer time, to join an *anti-pie association*. I wish the Granges would take up and discuss the question of "Pie or no Pie;" I think it would bear as much upon practical, every-day life, as the never settled questions "Which has done the most damage, fire or water?" or "Which deserve the most commiseration the Africans or the Indians?"

When fruit can be had for the picking, when you can sugar down for dessert, golden or red or black raspberries, or blackberries, when you can pile up a beautiful, artistic pyramid of pears, peaches and grapes, for a center-piece to your table, and can flank it by plates of sliced melons and rosy apples, what more could a king ask?

Does'nt it seem half like desecration, to spoil all that beauty by making of it a fruity paste between two layers of pie-crust?

Do believe for once that "the best way, is as good as any" and let the fruit come on the table in all its freshness and beauty and wholesomeness.

I know it will be hard to convince the old house holds, for we are joined to our idols; but the younger ones just coming on, should start fair.

The gain in the point of time in the course of one summer would be immense, and when we take into consideration the health, strength and labor expended on the pie business, in the hottest, busiest season, over the quickest fire, the sum is simply incalculable!

The house-keeper who will gently beguile her house-hold out of this extravagance and show them by practical illustration a more excellent way, will do something worth doing this summer, and I do not doubt but that she will set out, for the autumn campaign with a rare vigor and courage, and none of her family will be be a whit the worse, but rather the better for it.

WOMAN AND THE FRANCHISE.

AT a meeting of Edgewood Grange, No. 14, the following answer was given to the question, "What would be the advantages of the franchise to woman?"

There would be many. In the first place it would create an incentive in woman to learn everything useful outside of domestic economy merely, entering into the wider and far more important fields of society and politics, making such study to take the place of the too prevalent devotion to amusement, flirtation, and the follies of fashion. It would give them the advantage of equal education with men in branches of knowledge now considered superfluous to their accomplishment for the sphere of duties they are expected to fill, but which would fit them for offices of responsibility and trust, in which men are often found to fail.

Their keen observation, in connection with their sympathetic nature, eminently fits them for the office of inspecting our prisons and almshouses, could they be but elected or appointed to such position; especially where women are inmates. Certainly they would make the former more like schools of reform, as they should be; and see to the better arrangement and administration of the latter. Their more extended education would take away every objection to their demand for equal compensation with men for equal labor performed, and so enable them to keep their own families whenever that necessity might devolve upon them.

That women owning property should help to make and amend the laws under which they live, is an advantage which should never have been left to depend upon special franchise; yet there are apparently many who would deny to woman this obvious right.

With woman's aid, the same economy and arrangement which pervades the domestic would be transferred with happy effect to the political; and with her more careful and humane characteristics as compared with those of men, war might be superseded by arbitration, and numberless barbarous and hurtful practices, injurious to individuals and society at large, be entirely abolished. Thus, while the Queen of England has ever expressed herself as in favor of that better mode, and always favoring peace, we see the humane wisdom of woman in strong contrast to the recklessness of the war-seeking Emperor of Russia, who seems to seek in blood the solution of every national question affecting other countries. Women certainly would not tolerate war for slight causes, or make maudlin speeches with rum-soaked brain, to precipitate war by unwise official utterances, as men (at other times of brilliant intellect) sometimes do. The rum traffic would be swept from the land, and every good reform encouraged and carried through. The national finances would be safe from defalcations; for should a woman be a defaulter, the world would never get over it, although a man may run to the extreme of crime and folly to-day, and to-morrow, perhaps, be restored to as high a position as before.

As school trustees, women are much more interested than men, in exact proportion as they have more to do with the rearing and home education of the family. The success of women as Sabbath-school teachers is universally appreciated, and their ability and fitness to preach the gospel have been already extensively acknowledged. In law their aim would be to administer impartial justice in the fear of God, and in the interest of an exalted humanity; not for greed of gain, but with purity of purpose, avoiding the muddy pools of politics, contending for and at all times defending and upholding the right. Their presence has ever the effect of a great moral force, carrying with it as it were, a halo of kindness and purity. The beautiful equilibrium that God has created between man and woman, was intended to be mutually used for mutual good; and "what God has joined, let no man put asunder." This constitutes the great fundamental principle of justice for which we contend, and upon which stand erect and fair the walls of our great republic.

Senators may laugh and sneer at the appeal of intelligent women, whose refinement at least, merits a less uncouth reply. But their voice will not be hushed by levity and trivial excuses, for they are descendants of women who nurtured this grand nation into being through the dark and trying hours that so emphatically "tried men's souls." Not dames of Utah, not devotees of spiritualism, free love, or any other abomination, but a constantly swelling host of the intelligent, thinking women of the land, are demanding the ballot, and their full and complete enfranchisement. These the Grange was wise in promptly granting, and has in consequence been richly benefited. And with these, as regards her social, legal and political position, although they may be slow in coming, as are the cycles of progression, she will make her influence felt, and effect a higher and nobler civilization, which will redeem the world and save, for all time, this good and glorious republic. AMANDA L. SCHOLL.

Edgewood Grange, No. 14, N. J.

AN HEROIC WOMAN.

SISTER S., of the Order of Troyes, needs no adjectives. It would be a waste of breath to call her a woman of sublime courage and superhuman heroism. The Paris papers do not even publish her name; but that is well, for it would not look well in columns that are stained and blurred with the names of miserable sinners. This was what she did: She had taken some sick children out for a walk in the country, the oldest being only eight years of age, and they were suddenly assailed by a sheep dog, whose jaws were running with foam. She instantly saw the danger of her charges, and, resolutely interposing between the terrified children and the furious animal, bravely withstood its attack. She was severely bitten, and the dog, excited at the cries of the children, endeavored to rush upon them. Protecting with her body the children, who hung on her petticoats shrieking with terror, this brave girl threw herself courageously on the dog, and for ten minutes grasped it, rolling over with it, and thrusting her hand into its mouth to prevent its biting the children. Some peasants, who came up at last, beat off and killed the dog. The Sister was found to have fifteen deep wounds on her hands and lacerated arms. Skillful care was given to her wounds, and for a short time after her return to Paris there was some hope that she might escape the ultimate fate which there was every reason to fear. In a week or two hydrophobia in all its characteristic symptoms appeared; and Sister S. died from this fearful disease. She had saved five lives.

ITEMS FOR CORRESPONDENTS.

BY THE EDITOR.

MRS. HARRIOT, Glens Falls, N. Y.—*De biege* is the best material for your traveling costume. Twelve yards will make you a full costume, including outside wrap. The best quality comes at five shillings a yard; inferior goods cost much less, but the higher-priced goods are worth more than the difference in price, both in durability and appearance.

LILY GRANT, Carbondale, Pa.—Some of the large fancy stores in New York are closing out their stock of straw hats at very low figures. One firm offers an excellent quality of straw, in drab, white, brown and black, and in all the fashionable shapes, for 46 cts. Ostrich feathers do not vary much in price. There is always a market for them, and those which you see advertised for 50 cts. are of very inferior quality. Stiff wings are sold at 25 cts.; larger ones, in two shades, come as high as $1.

MINNIE MARTIN, Champaign Co., Ill.—Take your purple and white silk and turn it, if the pattern is the same on both sides; if not, change the breadths so that the fresher ones will be in front and those that are worn, at the back. Rearrange the trimming, being careful to have no worn or frayed edges in sight. Then buy some purple lawn or a prettily designed organdy with purple figure, and use it as an overdress. Cut it in princess style, with Watteau back, and trim and loop it with purple ribbon.

—A RURAL subscriber wants a recipe for exterminating bed-bugs. Will some of the ladies give her the benefit of their experience?

THE Roumanian princess, Kottsoff-Massalsky who uses the pseudonym "Dora d' Istria," has recently published in Paris a book on "The Poetry of the Ottomans." This lady has made a study of the literature and social condition of the Turkish Empire, and has written many works relating thereto. She is now preparing a treatise on "The Civil Condition of Women among the Southern Slavonians," which, when completed, may, it is reported, be read before the American Social Science Association, of which she is a corresponding member. She was born in Bucharest, and spent her youth in the region where the war lately raged. Her husband is a Russian nobleman, but her own ancestors were Albanians from Prevosa, where her family name of Ghika is very common. Her book on Ottoman poetry is in French, and is said to display much knowledge of her subject, though its manner is somewhat sketchy.

TABLE OF CONTENTS.

PRACTICAL DEPARTMENTS:

Rural Grounds, Notes from the (Illustrated)..... 453
Drainage—R. C. Carpenter (Illustrated)..... 453
Grasses, One of our Best—Prof. W. J. Beal..... 454
Animal Food and Animal Produce—L. A. R 454
Prize Cattle at the Oxford Show (Illustrated)..... 455
Garden Talks and Walks—Renoclaf..... 455
Kissena Notes—Sam'l Parsons..... 455
The Banana in California—Wm. C. L. Drew 456
Cause and Effect—L. A. Roberts..... 456
Capt. Cuttle's Advice—B. Pickman Mann..... 456
Young Man, Go West—W. H. White..... 457
Catalogues, &c., Received..... 457
Jottings from my Note-Book—Clinton 457
Rural Farm, Scene near the (Illustrated).....460, 461

Veterinary:

Inquiries answered by D. E. Salmon, D. V. M.
Bone Sprain and Ringbone..... 457
Blind Staggers in Horses..... 457

Answers to Correspondents:

The best Breed of Cows for Milk..... 458
What is Muck?..... 458
Steam-Plowing..... 458
Destroying the Canada Thistle..... 458
Saltpetering Stumps..... 458
The Wiegela..... 458
Propagating the Wistaria..... 458
Miscellaneous..... 458

Everywhere:

Georgia Notes—J. G. Rhea..... 458
Friend Sam's Mishap—Mrs. V. D. Covington.... 458
Crawford Co., Ark..... 458
Northumberland Co., Ont..... 458
Pitcher, N. Y..... 458
Higganum Conn..... 458
Rural Grounds..... 458
Botanic Garden, Cambridge, Mass..... 458
Pasadena Co., Cal..... 458

Domestic Economy:

CONDUCTED BY EMILY MAPLE

SUMMER SIFTINGS.

ANNIE L. JACK.

"But Robin red-breast builds his nest,
Singing a song of the joy to come."

So writes my charming friend, L. C. M., whose poems have a tender pathos and sweet touches of nature that cannot fail to endear her to the reader's heart. But the RURAL finds the saucy fellow stealing his strawberries and cherries, so he revenges himself on me by spelling the word robbin' in my "Kitchen Club" Meeting. Well, it is too warm to scold, and the RURAL ought to know best whether the pun was intended, or not.

How warm the last week has been! It is the first time in my life I ever saw gooseberries and currants fairly *cooked* on the bushes, the former especially being a serious loss as, spoiled and browned, they lie on the ground. "Sunstruck," said a neighbor, looking at them. The currants are a fruit not to be despised, being a corrective to the system eaten fresh, and when nicely canned, a treat of some value in winter. They must, however, be eaten to be appreciated, the acid taste being more grateful to many people than the cloying sweetness of some other fruits. In making jellies of any kind, I am sure it is a great help to warm the sugar in the oven while the juice is boiling. Sometimes I have made it too hot to touch, and even melting around the edges. It falls into the juice with a "hiss" as you stir it, but if it once comes to a boil you may take it off. Your jelly will be purer and form better for this simple process. Currant pies may be had in winter with the flavor of the fresh fruit, if all the small berries are canned. They do well even in narrow-necked bottles, if with plenty of syrup.

MOP-HANDLE PAPERS.—No. 1.

NOT long since I had occasion to make a morning call at the house of MRS. BLACKWELL, and found her engaged in cleaning her dinning-room floor. She seated me near a window which overlooked a well kept and well arranged flower-garden, and begged permission to finish the work, as it would occupy but a very few moments' time. Of course, she was quite excusable, as all know that a farmer's wife who does her own work, cannot obey all of the petty rules laid down in many books on etiquette. We were old school friends, and therefore did not stand on ceremony, but conversed upon topics which were most interesting to us, and at the same time the work was rapidly nearing its completion. Mrs BLACKWELL'S house was a new one, and therefore easily kept tidy. But I could not help observing the careless way she had of "slatting" the mop against the base-boards and leaving the muddy stain of the suds upon the unpainted wood, which was already blackened by previous washings. The newly-plastered walls were specimens—though far from beautiful—of spatter-work, made by the too forcible use of the mop-handle.

I might have suggested a little more care, but was too well aware that criticisms from those we deem our friends, are not always agreeable, and so refrained. But suggestions for the good of our rural population, are usually acceptable, when they come from the RURAL NEW-YORKER; and seeing the faults of others we often learn to correct our own. If a housewife observes a slackness in any department of the domestic machinery, outside of her own domain, she is pretty apt to improve upon the mode and so correct the infirmity whatever it may be. And when I call the attention of thousands of housekeepers, to those blackened base-boards, and spattered walls, I know that many of them will look about their homes, to see if the same fault is theirs. Occasionally a housewife takes a cloth and a pail of nice fresh suds, and washes away all stains after the floor has been wiped dry, but it is better to use a little care in the first work, and thus save the extra labor, by being sure that mop and water are clean. There are many conveniences for cleaning floors, for those who feel disposed to have them. Mrs. WHITE showed me a convenience which I should consider a triumph in the way of a mop. It consisted of a long-handled brush on the back of which was a box capable of holding a quart of water. The box was covered with rubber. After pouring a small quantity of water upon the floor, it was scrubbed thoroughly with the brush, and then all surplus water taken into the box by means of a rubber valve; and thence emptied into a pail, kept conveniently at hand. In this manner every square yard, could be thoroughly cleansed with clean water, applying soap where necessary. Mrs. BARTON says she always uses a large cloth, *and her hands*. She considers a mop with a long handle a nuisance. There are no stains, black and unsightly, on her walls or base-boards.

MAY MAPLE.

DOMESTIC RECIPES.

Blackberry Pudding.

Three pints of milk, five well-beaten eggs, three pints of blackberries, which have been previously stewed, with a little sugar; flour, salt, and two teaspoonfuls of yeast-powder. The batter should be stiff enough to drop from the spoon. The pudding is nice, either boiled or baked, and may be eaten with a wine sauce flavored with nutmeg.

E. K.

Blackberry Wine.

Press the juice from sufficient quantity of fruit to make two gallons; wash the pomace in two gallons of water; strain, dissolve ten pounds of white sugar in this, and add the strained, clear juice. Fill a clean cask perfectly full, and cover the bung-hole with a piece of cloth; let stand, filling up with some of the mixture, reserved for the purpose, until fermentation ceases; fill up again, drive in the bung tightly, and let stand in a cool place for six months. Then draw off without shaking the cask, put into bottles, cork tightly and seal.

MRS. CLARK.

Blackberry Jelly.

Place the fruit in a porcelain kettle with just water enough to keep from burning; stir often, and let stand over a slow fire until thoroughly scalded; then drain through a jelly-bag two or three times, if necessary to make it clear; measure, and allow as much sugar as juice; boil the juice briskly for ten minutes, add the sugar and boil ten minutes longer. To test the jelly, drop a little into a glass of very cold water, and if it goes to the bottom at once it is done.

Blackberry Mush.

Look over and wash two quarts of ripe berries; add two-thirds of a quart of boiling water and cook ten minutes; sweeten to taste and then stir in a scant pint of sifted flour; boil until the flour is thoroughly cooked; have a mold nicely buttered, pour in the mush and let it cool; serve with hard and wine sauce.

E. M. M.

Pathenia Pudding.

One quart of milk; five eggs; five tablespoonfuls of flour; bring the milk to a boil, reserving enough to wet the flour; then stir in the wet flour while hot; when cool stir in the beaten eggs, reserving the whites of two; bake one-half hour, and when cool spread over an icing made from the beaten whites and powdered sugar.

Corn Pudding.

Three dozen ears of corn scraped from the cobs; one and one-half pint of milk; three eggs; two tablespoonfuls of sugar; one teacupful of flour; two ounces of butter; a little salt; bake one hour and a half.

Miss SUE. MCCHAIN.

News of the Week.

POLITICAL.

Monday, July 14.

THE Potter investigating committee is crawling slowly through the mire of Louisiana politics, until the people are pretty near tired as well as supremely disgusted with the mass of wholesale perjury and political corruption laid bare. Nor can it be said that the Administration wholly escapes smirching, as it has liberally rewarded all those who took part in the alleged frauds in Florida and Louisiana. Of those connected with the count in the former State, Noyes was made Minister to France, Kasson Minister to Austria, McLin Justice of New Mexico, Sterns Commissioner of the Hot Springs. Dennis went into the Supervising Architect's office, where he had nothing to do but draw his pay. Cessna, the County Judge, who took the affidavits in Alachua, was made a postmaster. Black and Vance, the canvassers there, went, one into the Treasury and the other into the Post Office. Howell, who was clerk of Baker county, was made Collector of Customs. Bowles, who was election officer in Leon county, where the democrats claimed there was a fraud of seventy-four votes, went into the Treasury. Bell, another County Judge in a contested count, was made a timber agent. Humphreys, one of the electors, was made Collector of Pensacola. Leons, Sterns' secretary, was put into the Treasury. Maxwell, a republican detective, was made a lieutenant in the army. Phelps went to Paris with McCormick. Varnum, one of Sterns' Cabinet, became a Receiver of the Land Office, where Taylor, one of the clerks of the county courts, found a haven also. In short, wherever there was a charge of fraud, places have been found for those connected with it. The list of those connected with the electoral count in Louisiana who have since been rewarded with office is too long for insertion here, reaching, as it does, all the way from the members of the Returning Board down to Mrs. Jenks' brother.

His own forced confessions show E. L. Weber, the glib supporter of Anderson's statements, to have been a thorough rascal. In 1876 he swore before the Boutwell committee that in East Feliciana a series of the most horrible outrages were perpetrated; now he flatly denies the truth of his former statement; he wrote a letter to Kellogg detailing some of these outrages, now he says it was false and merely intended to be published for effect; he coolly acknowledges that while a State Senator he was one of a gang of members of the legislature who were in the habit of selling, to the highest bidder, their joint votes in favor of measures; and though most of his alleged confederates deny their complicity, the fellow's evidence damns himself, at any rate. From his evidence there is no doubt but that he was bribed by Pinchback and Kellogg, as stated here last week; and there can be little doubt but that his present evidence too has been paid for. Secretary Sherman has written another letter to the committee, renewing his request for an investigation into intimidation in Louisiana, on the ground that they have admitted evidence that there was none.

On Friday last, Senator Kellogg testified that at the last Presidential election the republicans in some parishes of Louisiana were thoroughly terrorized; that Packard got there more votes as Governor than Hayes did as President; that the republican Legislature was purchased by the democrats with the connivance of the Harlan-McVeigh batch of visiting statesmen; that much of the evidence given by Anderson, Weber, Kelly, and some of that poured forth by the sprightly Jenks, was false; that he knows nothing whatever about the forged certificates of election, never having inquired into the matter, as he didn't think it in the line of his duty. The first democratic Legislature in Louisiana has conducted itself in a manner by no means satisfactory to the people of that State. The members have done those things which they ought not have done, and left undone those things they ought to have done; and therefore given cause for not a little popular dissatisfaction.

After all, the workingmen's party or the Kerneyites, of California, have not secured a majority of the Constitutional Convention of that State. Their vote was so heavy in San Francisco and other large towns that the telegrams at first conceded to them the State; but the farmers and other country folks have reversed the vote of the cities, and the official returns give the following as the constitution of the convention: Non-partizens, 81; workingmen, 52; republicans, 11; democrats, 6; independents, 2. The non-partisans elected all their delegates at large; and Kerney is keeping up his own courage and that of his followers by boasting that he will secure the next legislature; meanwhile the demagogue is about to visit some of the large cities east of the Rocky Mountains. In most of the Northern States the workingmen's party is as yet an unknown factor in politics, as its real strength has not hitherto been tested. In this State both of the old parties are trying to obtain its support; at present the new organization is split into factions, which are bitterly bandying charges of corruption and treachery, and there is little doubt but that internal discord is its greatest danger. Meanwhile the situation of republicans and democrats is that of an armed truce. Each party is fearful of laying fully open the entire scope and tendency of its views; nor will either of them do so until one or the other becomes overwhelmingly dominant—in other words, each is now on its good behavior before the country.

The republicans of Ohio are bitterly denouncing the action of the late democratic legislature in so gerrymandering that State that it will return 14 democratic Congressmen to 6 republicans on the basis of the vote of 1876, when Hayes had 7,000 majority. In Indiana the democrats are equally loud in their complaints against the republican gerrymandering of that State a few years ago, so that 9 republican Congressmen were returned in 1876 against 4 democrats by the same vote that gave the democratic candidate for governor 5,000 plurality. Congressman Hunton, of Virginia, has had the primaries at Alexandria carried against him on the distinct ground of his having taken so prominent a part in the "fraud" business to the neglect of legislation needed by the State. Chester Arthur, Collector of Customs at this port for eight years, has been replaced by Gen. Merritt; and Naval Officer Cornell, by a Mr. Burt. Hayes tried twice to effect the removal of these officers, but was thwarted by the Senate. No sooner, however, has that body adjourned than he defies or dodges its decision. Both officers were favorites with the public, especially Arthur: both have been thoroughly efficient; against neither has any charge been even remotely proved; most of the reforms advisable in their department, have been, from time to time, suggested by Arthur; yet, because they favored Conkling's re-election to the Senate by the legislature to be chosen this fall, they have been thrust aside to make room for Merritt, an apt pupil of Fenton, who will, it is supposed, use the power of the Administration to antagonize Conkling's re-election. Even papers usually pro-administration either simply excuse or bitterly denounce this specimen of bogus Civil Service Reform; and the most influential of them, like the N. Y. Times, says that the officers are merely suspended, as self-respect must force senators to teach Hayes that he cannot evade their deliberate opinion, emphasized by two decisions in this matter. The latest Civil Service decision is that postmasters may belong to political associations, but must not be officers thereof.

MISCELLANEOUS.

New York merchants are disgusted at Vanderbilt paying eight per cent. in these hard times on $40,000,000 of watered railroad stock—which on the real capital invested is a huge rate of interest which the trade of the country has to pay. The public debt has been reduced about $24,000,000 during the past year. It is said that three thousand teachers are up in the White Mountains coolly studying their geography, geology, and hygiene, especially the hygiene. Gen. Sherman has issued an order instructing officers with regard to the legal bearing of the recent enactment against the use of troops as a posse comitatus. He explains away much of the supposed force of the recent law; for, according to him, the army can still be used for the suppression of domestic violence, the execution of judicial processes under the Civil Rights law, the keeping of peace at the polls, the expulsion of intruders from the Indian country, the preservation of government timber in Florida, the warning off of such foreign vessels as may improperly be in our ports, the putting down of insurrection in the States and the protection of the rights of discoverers of guano islands.

On the 10th a severe rain and wind storm prevailed over a great part of the Northern States from Nebraska to the Atlantic, producing a large number of deaths by lightning, and doing severe damage to crops, railroads and buildings. The hearing in the case of Fitz John Porter is still in progress at West Point, under the charge of Gen. Schofield. Gens. Warren and Longstreet testified strongly in behalf of Porter, their evidence going to show that Pope, whose orders he was cashiered for disobeying at the second battle of Bull's Run, did not know either the position of Porter or that of the Confederates; that Porter did not receive the order at the time formerly stated, nor could he have made the movements directed. A number of other officers and gentlemen spoke strongly as to Porter's bravery and loyalty.

Contrary to expectation, the Orangemen's meeting at Montreal, on the 12th inst., the anniversary of the battle of the Boyne, passed off in comparative quiet. Most of the stores were closed, banks and public buildings guarded, troops massed in large numbers at advantageous points, five hundred deputy marshals sworn in by the mayor, the police placed early in readiness, and all preparations made to prevent riot arising from religious and party animosity, and which would certainly be aggravated by the swarm of tramps and other rascals that had swarmed to the city in expectation of plunder. The mayor, Baudry, a Catholic, had prohibited a procession; six protestant aldermen had received from the government the control of the troops, instead of leaving it in the hands of the mayor, as usual in such cases; and this divided authority would, it was thought, add to the difficulties. After several minor outrages on detached parties of Orangemen decorated with party colors, the body of them decided to obey the mayor's order not to march in procession, and after a day of excitement, were sent from their barracaded Hall to their homes in cabs provided by the municipal authorities. Several of the officers of the organization were arrested, and a test case, as to their right to march in procession, is in their case to be made. Elsewhere no trouble was caused by scattered local Orango demonstrations; but on the 16th, the anniversary of the death of Hackett, an Orangeman killed by a mob last year, it is expected that another demonstration will take place in Montreal. Not more than two or three deaths, and only ten times that number of cracked heads and broken bones have resulted from the late unpleasantness. Cases of death from sunstroke have been very numerous throughout the country during the past week—generally the result of imprudent exposure; and nearly always avoidable by a little precaution.

For once Gen. Howard himself has had a battle, or rather a brush, with the Indians. He attacked 400 Bannocks at Butler Creek, Oregon, captured about 400 head of stock, and, after a fierce struggle, routed the savages, with a loss to his own command of 15 wounded and two killed; Indian loss unknown. *Per contra*, the Umatillas, in northern Oregon, surrounded 50 white volunteers, of whom seven only escaped to tell the tale

of their comrades' massacre. The terror-stricken inhabitants of Canyon City have taken refuge in a mining tunnel. Gen. Sherman sanguinely believes the outbreak in Oregon will be quieted within a month. The roving bands of hostiles there are supposed to number 2,000 men, while about 550 braves from the reservations are on the war-path. Gen. Sheridan is about to take command in the Black Hills, where a strong dash by detached bands of Sitting Bull's forces is expected.

FOREIGN.

On Wednesday 10th, Hoedel was tried at Berlin for attempting to assassinate the Emperor, and pleaded not guilty, insisting that he only attempted, publicly, to commit suicide. Thirty witnesses, however, testified that he aimed at the Emperor, while many others swore to his socialistic principles and his threats against the aged monarch. He was finally sentenced to be beheaded. Through the trial his demeanor was defiant and insolent. Bogardus, the American champion pigeon shooter, has beaten Mr. Cholmondeley Pennell, who is considered the best wing shot in England. The Paris exhibition will not close at the end of October as expected; but will remain open until December. Nearly all the juries have performed their work and made their reports. America, it is said, recives more medals than any other nation in proportion to the number of exhibitors. In one class all the American exhibits have obtained prizes; in another all but one. Medals will be distributed almost as liberally as, and far more promptly than, at our Centennial, the General Commission having increased the number of gold medals by 20; of silver by 40; and of bronze by 60 per cent. The natives of New Caledonia, the French penal settlement whither the communists were sent, after their crimes in 1871, have rebelled and massacred 125 whites, including women and children, besides capturing two military stations—cause a truly communistic propensity to treat the wives and daughters of the natives as common property.

The Congress of Berlin has completed its labors, signed the treaty settling the Eastern Question, and the chief plenipotentaries have already gone home. This momentous treaty—the most important since that of Vienna in 1815—contains 64 articles. The first twelve relate to Bulgaria. It is constituted an automatic tributary principality under the suzeralnty of the Sultan. It is limited in the south by the Balkans. It is to have a Christian government, the prince to be elected by the people, not to be a member of any reigning European dynasty, and to be confirmed by the Porte and the Powers. All religions are to be equal before the law; there shall be a native militia; Mussulmans removing away can retain their property, if administered by third parties; the plan of government is to be prepared by an assembly of nobles convoked at Tirnova to elect the prince. This must be done before nine months, and meanwhile the country is to be governed by Russian Commissioners assisted by delegates of the great Powers. The annual tribute to the Porte shall be settled at the end of the first year by the Powers who have signed the treaty. The Turkish forces are to be withdrawn within a year, all the fortresses to be destroyed and no new ones erected.

From the thirteenth to the twenty-second articles, inclusive, relate to Eastern Roumelia. This is formed of the land south of the Balkans, containing among the population a majority of Christians. Its boundaries have not yet been telegraphed. It is to be under the direct political authority of the Sultan, having administrative independence and a Christian Governor-general, appointed for five years by the Porte with the assent of the Powers. A European Commission shall determine in three years the power of the Governor; also, the judicial, financial and administrative requirements of the province. The Sultan shall fortify the frontiers, keep troops there, but employ no irregulars or quarter troops on the inhabitants. Internal order shall be preserved by native constabulary and local militia, account to be taken in their formation of the religion of the inhabitants where they are stationed; the officers to be named by the Sultan. The Governor, however, may call in Turkish troops if security is menaced. The Russian army in Bulgaria and Roumelia shall not exceed 50,000 men. They shall begin to evacuate the territory in nine months, three months being allowed to complete the evacuation.

By the twenty-third article Austria is authorized to occupy and administer Bosnia and Herzegovina with the exception of Sandjak and Novi-Bazar. Austria and the Porte have come to an agreement on this point. The Porte is showing great good-will, and has ordered the submission of some of the inhabitants who intended to resist. Servia also has taken measures to prevent filibustering from her territory in case the inhabitants of these provinces should oppose the Austrians by a guerrilla warfare.

From the twenty-fourth to the thirtieth articles, inclusive, relate to Montenegro. Its independence is recognized; no religious distinctions must be tolerated. No fortifications must be constructed except to protect Scutari. Antivari is to be closed to war ships of all nations. A Turkish-Montenegrin Commission shall be engaged for three years regulating religious matters and transfers of property. The Austrian Consuls shall protect the Montenegrin flag; as it can have no flag or ship of war of its own. The Montenegrins must evacuate within twenty days the territory they occupy beyond the limits of the new principality.

From article thirty-one to article thirty-nine relate to Servia, whose independence is recognized on condition of freedom being allowed to all religions. The frontiers of the new State have not been telegraphed. The present commercial relations of the country with other nations shall remain in force until new arrangements are made. The Servians are allowed fifteen days to evacuate the territory not in their new limits.

From the fortieth to the forty-ninth article inclusive, relate to Roumania, which is declared independent on the same terms as Servia. Roumania gives back to Russia that part of Bessarabia taken from her under the treaty of Paris, in 1856, and in lieu thereof receives the Dobruscha and a strip of territory south of it. Servia's and Roumania's tribute to the Porte shall be capitalized into a gross sum, at a rate arranged by the Powers and the Porte, and all these new States have to bear a share of the Turkish public debt, in proportion to the extent of territory they occupy.

The fortifications on the lower Danube must be leveled, no ship of war must navigate this part, except that guard-ships of the Powers at the river mouth may ascend to Galatz. The regulation of the lower Danube rests in a Commission appointed by the Powers, and this will act independent of territorial authority. Austria-Hungary is to remove all obstructions placed in the river during the late war. The Porte engages to apply to Crete the liberal plan of government of 1868; and to deal liberally with its other subjects, taking into account their religions, and consulting the Commission on Eastern Roumelia. All parties throughout what is left of Turkey are to be allowed to testify in court, become public officers, and exercise all professions and industries without regard to their religious beliefs. Other articles relate to affairs in Asia, but these have not yet been telegraphed to this country. England has occupied the island of Cyprus, and guarantees the present Turkish possessions in Asia. HERMAN.

Hearing Restored.—Great invention by one who was deaf for 20 years. Send stamp for particulars. VERRY & HARPER, Lock Box 80, Madison, Ind.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, July 13, 1878.

BEANS AND PEAS.—Medium beans are weaker, the extreme is only given for such small parcels as the local trade requres in warm weather. Marrows are selling fairly for summer, but the totals do not compensate for recent dull trade. White kidney have no settled market. Red scarce; choice firm at $3.25; Pea beans nominal; Black beans firmer. Peas quoted about the same as before; Canadian in bulk and bond, 75c.; Green, $1.05@1.10; Southern B. E. $3@3.25.

We quote medium beans, prime, $1 57½@1 60; fair to good, $1 55@1 57½; marrows, prime, free on board ship, fair to good, $1 67½@1 70; Pea, $1 40@1 45; white $1 60@$1 63½; kidney, $1.40@1.60; red do., $3@3.25; black, $2.35@2.40; Lima, $3.75@4.25.

BUTTER.—Supplies as a whole continue very liberal and the uncertain trade of summer prevents sellers from taking any advantage of days that show limited receipts. Exporters have bought freely, and in fact they are the only buyers who support the upper quotations. Market buyers who use under-priced but sound, sweet stock, are looking at western more regularly, and some marks of dairy are very cheap at the extreme for such use. A good deal of western, however, goes into cold storage and will have to wait for a chance. Eastern buyers have been in market during the week but have aimed to buy state Welsh close, especially as some western lots have a very tempting difference in prices. With good useful dairy, and factory selling at 10@13c., low-priced State is apt to be neglected, quality being favorable. It is thought in the trade that sales of western could be kept steadier if more care was taken at shipping points to keep grades uniform. Firkins not active, some orders can be profitably repacked here. The future of butter looks cheap.

State creamery, choice, 19@20c.; other, 16@18c.; half tubs and pails, choice, 18@19c.; other, 14@15c.; Welsh tubs, best, 15@16c.; other, 10@12c.; poor State, 6@8c.; State firkins, 15@17c.; Western creamery, choice, 19c.; other, 16@18c.; Western dairy, best, 13c.; other, 8@9c.; factory (ladle packed), 9½@10c.; other, 6½@8c.; milled Western, 5½@8c.; old and grease, 3½@5c.

Receipts for the week, 31,950 pkgs.; exports past week, 10,009 do.

CHEESE.—The market was in poor shape early in the week. The country advices showed an easy tendency; the supplies were piling in here to an excessive amount, and the hot weather was against holding. At one period 8c. was the general rate for fancy factories, and special lots at 8¼c, with white and colored lots selling alike. A large quantity of heated stock of standard factories had to be pressed at the best prices available, some selling down to 7@7½c. Towards the close, cooler weather and a falling off of receipts, with increased export interest, have put matters in better shape, and sales of average fancy lots now run at 8½c., and several special lots reaching 8¾c. The exports for the week have been 123,305 boxes.

Quotations are for factories fancy, 8½@8¾c.; 7@7½c. for good and prime; 6½@7c. for fair; 5@6c. for half skimmed; 2½@3c. for skimmed. State, farm dairy at 6½@7½c. for good to choice, 5@6½c. for fair to good and 2@3c. for poor skimmed. Wisconsin factory, fine to fancy, 7½@8c.; do. good to prime, 6½@7½c.; do. fair, to good 6@6½c.; Western factory, fine, full cream, cheddar, 7½@7½c.; do, fine, full cream, flat, 7c; do. slightly skimmed, flat, 5½@6½c.; do. half skimmed, 4@5½c.; do. full skimmed, 3@3½c.

Exports, past week 123,305 boxes.
Receipts for the week, 120,000 boxes.
Gold closes at 100⅝.
Liverpool cable quotation, 45, 5d.

FRESH FRUITS.—Apples are making quite a show. Northern lots mostly too green. Norfolk, bbl., $1.50@2; State and N. J., sour bough, $2@2.50; sweet do., $2.50@3; Red Astrachan $3@3.50; smalls and windfalls, $1@1.50. Early pears quoted $2@3 ₱ bbl., including Sugar. Peaches are in good supply and sell well at paying prices, though Maryland cannot be included in the remark. These latter are "Hales," and buyers find it difficult to handle them after having displayed the finer grades of early more Southern sorts. Georgia, ₱ bu., $1@4.50 for prime; fair, $3@3.50; S. C., $2.50@3.50; N. C., choice, $3.50@4; fair, $2@3; Md., 75c.@$1.50 ₱ crate. Blackberries have been in heavy supply and many invoices have sold low to preservers; even now fine stock is easy. Wilsons, N. J., 7@9c. ₱ qt; Md. and Del., 5@7c.; Dorchester, 4@6c. Whortleberries, ₱ bu., $3@4; demand good. Every year increases the baking demand. Currants abundant at 4@5c. for small; 6@8c. for cherry; 5c. for black. Raspberries low; Antwerps, 3@4c. for thirds; natives, 1½@2½c. do.; Brandywine, 4@5c. Watermelons have improved; Florida, $20@35 ₱ 100; Charleston and Augusta, $35@45. Peanuts dull at $1.35 for best hand-picked Va.; good to fine, $1.25@1.45; ordinary trade is using some stock at $1.30. Hot-house Black Hamburg grapes, 50@75c.; Sweetwater, 30@40c.

DRIED FRUITS.—Apples have not shown further important improvement, with prices wholly nominal. Peaches and small fruits are very slow, and in the instance of new pitted cherries sales have been made lower.

Peaches—Fancy North Carolina 10@11c.; good to prime Georgia 8@9c.; unpeeled halves, 3½@4½c.; quarters, 3½@3¾c. Pitted cherries, nominally, 13½@14c.; Raspberries, 26c.; New York State plums, 10c.; Southern plums, 9c.; Blackberries nominal. Apples—State quarters, 3½@4c.; do sliced, prime, 4½c.; good, 3½@4c.; Western quarters, 2@3c.; Southern at 4@4½c. for prime sliced; 3@3½c. for fair to good; Southern quarter, 2@3c.; Tennessee quarters, in bags, at 1½@2c.

Exports past week, 736 bbls. apples.

EGGS.—Receipts for the week, 8,311 bbls. The market has ruled unseasonably weak, especially for Western. Dealers thought on Tuesday last that the bottom had been reached, but Western are losing so badly that most buyers prefer prime Canadian or good State.

Choice near points are firm; N. J. and L. I. 14@15c.; State and Penn., 12½@13½c.; fresh Western, 10½c.; do. Canadian, 11@12c.; inferior, 9@10c.

GRAIN.—The English markets have been hardening and with small receipts here, and a good trade proves shippers prices have been advanced slightly.

Latest sales of wheat are of white State in lots at $1 23½@1 26; ungraded white western at $1 25; ungraded amber at $1 12; extra white at $1 26; No. 1 amber round at $1 13; new ungraded red western at $1 12@$1 13; new No. 2 red at $1 12@$1 12½; No. 1 Minnesota spring afloat at $1 12; No. 1 Milwaukee spring, in store, at $1 10; No. 2 spring at $1 05¾@1 07; New York No. 2 spring, July option, at $1 05¼@1 05¾; do., August option, at $1 01¾; do., September option, at 96¾@97c.; No. 2 red, July option, at $1 11¾@1 12½; do., August option, at $1 05@$1 05¾, closing at $1 05¾@$1 05¾; do., September option, at $1 03¾. Rye at 69@61c. for western and 60¾@62 for State. Corn—at for No. 2, July option, at 47¾@48c; No. 2, August option, at 47¾@48c.; No. 2, September option, at 49c; steamer mixed July option, at 46¾@47c.; do., August option, at 46¾@47c.; do., September option, 47@47½c.; steamer mixed at 46@47¾c.; New York No. 2 at 47¾@48c.; New York No. 2 (old) at 49@50c.; ungraded mixed at 49@48c.; and round yellow at 52c Oats—New York No. 1 white at 39c., with large lots held at 42c.; New York No. 2 white at 35¾@.; New York No. 1 at 35c.; New York No. 2 at 34c.; white western at 33@40c.; mixed western at 32@35c.; No. 2 Chicago at 35c.; white State at 38@39c; mixed State at 33@35½c.; New York extra white quoted at 42@43c.; New York No. 3 white at 31c.; New York extra at 35½@36c.; New York No. 3 at 32c.

HAY AND STRAW.—The arrivals have fallen off, but as the new crop can be expected in full quantities shortly, there is a disposition to release supplies promptly, at current figures.

Bale hay, 45@55c. for shipping, and 60@75c. for retail qualities; Straw quoted at 40@45c. for long rye, and 40@45c. for short rye; and 30@35c. for oat.

Exports for week 1,810 bales.

HOPS.—The movement is slack, and prices are in a good degree nominal. As we are so close to the new crop, brewers buy only as against actual needs, but there is an indisposition to name easier prices among holders, with the consideration of moderate stocks. New Yorks, good to prime, 10@12c; do., low to fair, 7@9c.; Eastern, 7@10c.; Wisconsin, 7@10c.; Yearlings, 2@3c.; Olds, all growths, 1@2c.; Pacific Coast hops, 10@12c.

LEATHER.—The quotations are for hemlock, 19½@20c. for light; 19½@21½c. for middle; 20@21½c. for heavy and 17½@18c. for good damaged.

PROVISIONS have shown but little change in price and are dull. Mess pork quoted $10 25@10 50 for spot; $10 25 for July and August, and $10 30 for September. Bacon at 6c. for long clear, and 6¼c. for short clear. Lard at $7 20 for spot; $7 22½ for August; $7 30 for September. Stearine at 9 for choice. Tallow at 6¼ for prime. Beef hams at $22 for new. Beef—For extra mess, $11 75@12; plain mess, $10@11 50; packet, $11 50@12 for bbls. and $16@17 for tcs.; family at $13@14; extra India mess, $19@20 for city brands; do. Philadelphia, $18@$19.

TOBACCO.—Export demand has been very fair and the large receipts are closely sold at steady prices. Quotations are for

Missouri, Kentucky, and Tennessee—Washed fleece, 30@34c.; unwashed, 23@26c.; unwashed combing, 29@32c.

LIVE STOCK MARKETS.

Saturday, July 13th, 1878.

BEEVES.—Receipts for the week, 7,933 head; do., last week, 8,964 do. Light receipts and an active demand made a strong and higher market; the advance over Wednesday's rates is ½@¾c.; the most improvement being for ordinary slaughterers' stock. Colorado and Texas, 8¼@9¾c.; native, 9@11c.; with selections, 11½c. Exporters paid 10¼@11c., for good to prime fat steers, at the close with the prospect of liberal receipts, dealers do not look for next week's market to open with a repetition of the above high ranges.

COWS AND CALVES.—The market is only nominal; nothing to warrant the shipment of stock this way.

VEAL CALVES.—Live milk were in good demand at 6@7c. for ordinary good. Buttermilk, 2¾@3¾, which is better.

SHEEP AND LAMBS.—Receipts for the week, 20,475 head; do. last week, 26,109 do. The market has not been overstocked, and sales were quick at 3¾@5c. with a car load of nice Kentucky at 5¼c., and selected Ohio at 5¾c. N. Y. Lambs, 6¼@7¾c.; Western State and Southern, 5¾@6¾c.

SWINE.—Receipts for the week, 22,026 head; do. last week, 25,413 do. No late sales of live; market nominally, 4¾@4¾c. Dressed city, 5¾@5¾c. heavy to light; 6c. for pigs.

Reading for the Young.

WHAT A BIRD THOUGHT.

Said the boy, "I'll climb that tree.
And bring down a nest, I know."
Quoth the girl, "I will not see
Little birds defrauded so!
Cowardly their nests to take,
And their little hearts to break,
And their little nests to steal;
Leave them happy for my sake!
Surely little birds can feel!"

Quoth the boy: "My senses whirl;
Until now I never heard
Of the wisdom of a girl,
Or the feeling of a bird!
Pretty Mrs. Solomon
Tell me what you reckon on
When you prate in such a strain;
If I wring their necks anon
Certainly they might feel pain!"

Quoth the girl, "I watch them all,
Making love and making fun,
In the pretty ash-tree walk,
When my daily task is done;
In their gentle eyes I find
They are very fond and kind.
Every change of song or voice
Plainly proveth to my soul
They can suffer and rejoice."

And the little robin-bird
(Nice brown-black and crimson breast)
All the conversation heard,
Sitting, trembling in his nest.
"What a world," he cried, "of bliss,
Full of birds and girls were this!
Blithe we'd answer to their call;
But a great mistake it is
Boys were ever made at all!"

"POCKET-MONEY FOR THE YOUNG PEOPLE."—No. 10.

STARR MORRIS.

I should like to tell the Rural young people how some youthful neighbor of mine earned quite a sum of pocket-money.

Early in the autumn they provided themselves with a quantity of evergreens, Ground Pine, Hemlock, Spruce, etc., also white blossoms of Everlasting, a shrub that grows plentifully in New England pastures, together with the scarlet berries of the Bitter-Sweet, and as the holidays approached they, with the help of their elder sister, made them into the loveliest wreaths, crosses, crowns, anchors and stars, and sold them in the city for Christmas decorations. They were the prettiest things I have ever seen for that purpose.

Every day for two or three weeks, a bright-faced little girl and boy could be seen trudging a mile to the city, their baskets ladened with these lovely things, returning with empty baskets and full purses; and many of our homes were made bright all winter with specimens of their handi-work. I know their hearts were made glad with the money thus earned.

Perhaps some one would like to know how to make similar ones.

The process is simple: Make a form of a cross or whatever design you fancy, of thin pine or pasteboard, and cover it with the green, putting in the white blossoms or red berries to form an emblem or word. If the form is of pasteboard, sew the greens to it with coarse thread; if of wood, tie them on. I remember some beautiful moss baskets and crosses with which—when I was one of the young people—I used to delight the hearts of my friends, as well as my own. Not the green moss that grows in the damp woods, but the dry moss that grows on rocks, old stumps and logs, and can be found on old rail-fences. Only a close student of this class of plant-life can realize the wonderful beauty that is hidden away in what appears to be only an old stump, or an old gray rock. These mosses can be readily peeled from the rock or wood, and sewed on pasteboard made into basket form, and when filled with ferns or flowers, form a pretty ornament: or made into a cross can be hung under a picture. These things, so common to those who live in the country, are treasures to those who live in the city, or to the invalid who is shut away from all forms of life and beauty seen in the woods and hills. And to show that it is so, I append a bit of poetry written on seeing one of the crosses of which I have been speaking. I have had it a long time and have forgotten, if I ever knew, from what paper I took it:

A tiny cross
Of soft wood moss,
And that is all!
And yet it hath a voice that speaks to me,
Of patient faith and holy victory—
Faith that could triumph in Gethsemane,
And for our sins a sinless sufferer be,
Upon the Cross.

A shadowy cross
Of soft gray moss
And that is all!
But when from sinful thoughts I vain would flee,
This little cross reproaches silently,
As if it said: "Canst thou ungrateful be,
When Christ, to cleanse from sin hath died for thee,
Nailed to the cross?"

A little cross,
Of velvet moss,
And that is all!
Yet when I've left my darlings with the dead,
And storms of sorrow have swept o'er my head,
I've seen this beacon cross through tears, and said,
"What grief He bore! I will be comforted,
And bear my cross.

Oh! tiny cross
Of forest moss,
That is not all!
I'll have thee for my daily guard and guide,
And learn of thee to conquer sin and pride:
Thou shalt speak oft of Jesus crucified,
And all the burden of life's woes I'll hide
Beneath His cross.

[It was taken from the "Sabbath Reading" column of The Rural.—Eds.]

ENGLISH LITERATURE FOR SCHOOL-GIRLS.

And boys, too, if they are interested in Literature: if all their interest is not concentrated in bats and balls, fishing-tackle, boating, horses, etc.

When I was a school-girl and studied Literature I am sorry to say, I had a bad fashion of *not* studying it as I ought to do. When a lady asked me at what time Shakspeare lived, I could only stumble through several wrong guesses as to the century. That was all owing to my negligence in studying. Perhaps, like other foolish girls, I used to say, "Oh! I don't know anything about Literature; Miss H. is such a poor teacher." Whenever any of you, my girl-readers, are about to make any foolish remarks of that kind, stop a moment, and consider whether it is poor studying or poor teaching which makes you a poor scholar.

Now, if you will listen, I propose to give you short accounts of various popular authors. I don't propose, however, to do all the work. I shall leave a little "guess-work" for you to do. You must find out the name of the author of whom I write. Can you do as much as that?

Well, the person of whom I am going to write was born at Elphin, Ireland, November 29th, 1728. His life was full of adventure. When only seven or eight years of age he would amuse his father and mother with his poetical flights, but our poet does not seem to have been much elated at his success, as he threw his youthful effusions into the fire. He was by no means a handsome youth, as his body was short and thick, and his face was disfigured by small-pox.

In 1744 —— was sent to Trinity College, Dublin, where one day he invited a party to a supper and a ball in his rooms, which coming to the ears of his tutor, the latter entered the place in the midst of their jollity, abused the company, and administered manual correction to the host in their presence. This mortification had such an effect on the mind of the young man that he resolved to seek his fortune in some place where he should be unknown. Accordingly, he sold his books and clothes, and left the college, but loitered about the streets until his money was exhausted. With a solitary shilling in his pocket, he, at last, left Dublin. By abstinence, he made this sum last him three days, and then was obliged to part with the clothes on his back; in short, to such an extremity was he reduced, that a handful of peas, given him by a girl at a wake, was the most satisfactory repast of which he had ever partaken.

After many adventures he found his way home and was sent to college. He devoted himself for a short time to the study of law, which was abandoned for medicine. He could not make a living, as his generosity impelled him to administer to the wants of all who applied to him. His friends, if we can judge from an anecdote, had not much confidence in him as a physician. —— remarking that he prescribed only for his friends, some one rejoined, "I would advise you to prescribe only for your enemies." As he said, himself, "I got few fees, although I had few patients."

Referring to his forlorn condition, he writes:—"At London you can imagine what difficulties I had to encounter; without friends, recommendations or money; and that in a country where being born an Irishman was sufficient to keep me unemployed. Many in such circumstances would have had recourse to the friar's cord or the suicide's halter. But with all my follies I had principle to resist the one, and resolution to combat the other."

Besides poems, our author wrote novels and plays. We are told that in his last journey to school he had an adventure which is thought to have suggested his comedy, "She Stoops to Conquer."

On his journey, when he reached the town of Ardagh, he inquired for the best house in the place, meaning the best *inn*, but his informant, taking the question in its literal sense, showed him to the house of a private gentleman, where, calling for some one to take his horse, our hero alighted and was shown into a parlor, being supposed to have come on a visit to the master, whom he found sitting by the fire. This gentleman soon discovered the mistake, but being a man of humor he favored the deception. The Celt ordered a good supper, and invited his landlord and landlady, with their daughters, to partake of it. He treated them with a bottle or two of wine, and ordered a hot cake to be prepared for his breakfast. It was not until about to depart, and calling for his bill, that he discovered his mistake. In 1759, he was engaged, at a salary of one hundred pounds a year, to write for The Public Ledger a series of papers. These he called "Chinese Letters." They were afterwards collected under the title of "The Citizen of the World."

The Earl of Lisburne one day lamented —— that he should neglect the Muses, to compile histories and write novels, instead of composing poetry, with which he was sure to charm his readers. "My Lord," replied our author, "in courting the Muses I should starve; but by my other labors I eat, drink, wear good clothes, and enjoy the luxuries of life."

He wrote a History of England, a Roman History, a History of the Earth and Animated Nature, a Grecian History, from the earliest state to the Death of Alexander the Great. When you visit Westminister Abbey, as you doubtless all hope to do, you must see the monumental stone which was erected in honor of this man, in Poet's Corner, between those of Gay, and the Duke of Argyle.

Now, who can tell me the name of our author, and also the names of some of his more popular works? Sans Souci.

LETTERS FROM BOYS AND GIRLS.

News from Honolulu.

Dear Uncle and Cousins:—How are you all? Quite well, I hope. But what is the reason I see so few letters? Surely interest has not flagged, or have you my excuse, *i. e.*, so little time? "Pilikea," as the natives say. Oh Uncle True! Papa has a "Cricket," and a veritable cricket it is. Last Tuesday (the 11th) was Kamehameha Day, and a holiday. There were races at the Park and picnics in all directions, but I attended neither; had company at home instead. We are having a splendid big shower to-day, and it is much needed, the weather and roads are so hot and dusty. Our missionary brig left last week on her yearly trip to Micronisca. Our society, the "Missionary Gleaners," sent quite a large box of food and clothing. I had the superintendence of a large quilt. It was real pretty when finished, and much admired. To-morrow evening I hope to attend the last exercises of a graduating class from Punahou College. As the college is a distance from town the exercises will be held at Fort Street Church. I had a disappointment yesterday. By the steamer from San Francisco I expected a *real* cousin; owing to some delay he did not arrive, but we are sure that he is on his way. How glad I shall be to meet him; it is twelve years since I last saw him. Soon after my cousin's arrival I expect to steam away to Hawaii, and while there I may be able to find something interesting to tell you. As it is soon time for the mail to close, I will also close my letter with much "Aloha nui lo a" to all.

Hawaii Nei.

In What County is Valley Forge.

Uncle True and Cousins:—Will you admit me as one of your number? I am a girl sixteen years old. I live on a farm near Evansburg, a little village in northwestern Pennsylvania, on the banks of Conneaut Lake, which I have heard said is the largest lake in Pennsylvania. I go to school the greater part of the time, and study the common English branches. I think I can answer "Wild Cherry's" question; at least I can try. The word "girl" is found once in the Bible—in the book of Joel, in the third chapter and third verse. In what county is Valley Forge? In answer to "Kit's" question I would say, I think novels of almost any kind are injurious to the memory. Perhaps you will hear from me again. Clyde.

Evansburg, Pa.

She is a Buckeye Girl.

I am a Buckeye. Do you understand? I see the bed-quilt question has been fully discussed. I only wish to say I pieced one, and knitted myself a pair of stockings when eight years old, and assisted Grandma in the dairy too, as she lives on a farm. Some one has asked, through the Rural, what country girls can do to earn a little pocket-money? I am fearful of making this article too loog, or I might tell of a few ways by which I earned several dollars. Brightie.

Fairfield Co., Ohio.

[Should be glad to have you do so.]—U. T.

The Puzzler.

MOUNTAINOUS ENIGMA.

I am composed of 137 letters:
My 89, 122, 84, 17, 28, 36, 16, 24, 95, 88 a mountain on the Isle of St. Vincent, W. I.
My 21, 27, 9, 1, 10, 36, 41, 33, 52, 31, 23, 73 a mountain peak of Corsica.
My 82, 117, 36, 95, 127, 85, 39, 25, 61, 115 a mountain peak of Ireland.
My 29, 32, 51, 67, 4, 5, 38, 18, 42 a mountain peak of Spain.
My 63, 37, 65, 76, 71, 24, 79, 86, 115 another mountain of Spain.
My 129, 94, 106, 22, 53, 34, 55, 78 a peak of the Elborz range.
My 6, 88, 23, 36, 91, 92, 61, 133, 108, 115, 56, 127, 87, 72, 67 a mountain of Ceylon.
My 57, 74, 11, 46, 64, 45, 44, 68, 83 a mountain peak of Australia.
My 36, 84, 12, 23, 66, 102, 104, 82, 2, 131, 70 a peak of the Samen range of Africa.
My 128, 132, 53, 107, 23, 50, 129, 103, 93, 123, 134, 113, 48 a peak of the Andes in the United States of Columbia.
My 7, 25, 29, 37, 38, 47, 61, 77, 48, 80, 114 a mountain of Chili.
My 20, 119, 124, 110, 120, 121, 37, 95, 129 a peak of the Alps.
My 26, 5, 36, 97, 61, 43, 49, 84, 59 a peak of Greece.
My 112, 8, 100, 23, 84, 60 a range along the Adriatic.
My 125, 5, 81, 63, 32, 62 a peak of the Balkan Mountains.
My 82, 37, 126, 109, 57, 19, 15, 72 mountains of New York.
My 116 30, 118, 67, 40 a mountain of Palestine.
My 94, 90, 75 a mountain of the Isle of San Mayen.
My 54, 136, 137 is a suffix.
My 35 98, 111, 130 are duplicate consonants.
My 58, 69, 96, 99, 101, 105 are duplicate vowels.

My whole is a quotation from a collection of selected gems.

☞ Answer in two weeks. Little One.

TRIPLE ACROSTIC.

1. A heathen. 2. A man's name. 3. A flying banner. 4. A wanderer. 5. Bubbling. 6. To dress a second time. Primals, centrals and finals form three spices.

☞ Answer in two weeks. Dr.

Sabbath Reading.

TIRED.

Dear God, I am so weary of it all,
I fain would rest me for a little space.
Are there no great rocks where the shadows fall
That I may cast me down and hide my face?

I work and strive, sore burdened and afraid,
The road is flinty and the way is long,
And the weak staff whereby my steps are stayed,
Bends like a reed when bitter winds are strong.

The lofty thought proves fruitless in the deed;
The prize I toil for seems a glittering lie!
There is no comfort for present need,
No guerdon promised for futurity.

I shrink in terror from the endless task,
I look with horror on the barren land,
And ask, as only hopeless hearts can ask,
The meaning of my days to understand!

EXPOSING THE DEAD TO THR GAZE OF THE CURIOUS.

In a recent address the Rev. T. C. Jerome criticized the custom of exposing the the dead to the indiscriminate gaze of the curious and will, no doubt, meet with sympathetic approval from most readers. We give a gist of the sermon.

"When we are alive and strong and fair in the beauty and eloquence of the 'human face divine' above all other images of God, nevertheless, then, we regard it an impertinence for a stranger or casual acquaintance to stare at us. And if it so be that our features are marred by accident, disease or natural deformity, the more it is counted the part of courtesy and true kindness that even our friends should not allow their glance to rest upon the blemishes of our countenances.

"Then, how much the more when all health, gospel and soul have forever departed from the fleshy tabernacle, when it lies so soon after the supreme material dishonor and discomfiture of the earthly estate, the last enemy having triumphed over the flesh and set his stamp upon it, the worm already commencing to feed sweetly, earth to return to earth, dust to dust, ashes to ashes; then to bid all the curious or careless to linger to look and hasten to talk, is an ignominy and insult to those whom we have loved. Have not some of you dreaded it for yourselves? And was there ever a husband who may thus have had the face of a wife laid bare, or parents of a maiden daughter, but that an added involuntary pang and shame thrilled them as the crowd passed by?

"'It is sown in corruption,' the text says. Shall strangers be suffered to look upon that corruption? 'It is sown in dishonor." Shall strangers behold the dishonor of the flesh still so sacred and dear to kindred as having been but yesterday the loved one's tabernacle?

"Such gazing of a crowd upon the dead can but seem to me very like the sin of Noah's second born who looked upon his father's nakedness; wherefore was it written through all time, 'Cursed be Canaan.' Supreme nakedness, dishonor, defeat of the flesh is this when the spirit has forsaken it; as called in the word of God, 'unclothed,' 2 Cor. v: 4, 'not for that we would be unclothed but clothed upon that mortality might be swallowed up of life.' Oh, brother men, I beg you, let us henceforth keep the crowd away from the sacred dust of our loved ones, when that dust has been 'unclothed.'

"But it will be urged that, apart from the family circle, there may be many friends in the congregation who will wish a last look at their deceased friend. Yes, that is what I wish of my friends! And therefore I will not look at that poor clay in its coldness, corruption and cerements; lest it should take the place to me of the features of my friend, as I last saw them in life, beauty, health and soundness, or at least in the presence of the spirit which is the only real beauty or power of man. For the very reason, I say, of wishing to remember our friends we ought not to wish to look upon their corpses."

The sweetest comforts of this life are but like treasures of snow; do but take a handful of snow and crush it in your hands, and it will melt away presently; but if you let it lie upon the ground, it will continue for some time; and so is it with the contentments of this world. If you grasp them in your hands, and lay them too near your heart, they will quickly melt and vanish away; but if you will not hold them too fast in your hands, nor lay them too close to your heart, they will abide the longer with you.

God oftentimes delays, that his people may come to him with greater strength and importunity; he puts them off, that they may put on with more life and vigor. God seems to be cold, that he may make us the more hot; he seems to be slack, that he may make us the more earnest; he seems to be backward, that he may make us the more forward in pressing upon him.

The work of repentance is not the work of an hour, a day, or a year, but the work of a life. A sincere penitent makes as much conscience of repenting daily, as he does of believing daily; and he can as easily content himself with one act of faith, or love, or joy, as he can content himself with one act of repentance

---

Do not put off God to old age; for old, lame and sick sacrifices rarely reach as high as heaven.

Young saints often prove old angels, but old sinners seldom prove good saints.

PERSONAL ITEMS.

Milton died aged 66 years.
Cæsar died, aged 55 years.
Napolean died, aged 52 years.
Columbus died, aged 64 years.
Richelieu died, aged 57 years.
Shakspeare died, aged 52 years.
Henry VIII. died, aged 56 years.
Richard, III, died, aged 32 years.
Byron, Lord, died, aged 38 years.
Burr, Aaron, died. aged 80 years.
Demosthenes died, aged 53 years.
Pitt, William, died, aged 47 years.
John Hancock died, aged 56 years.
Burns, Robert, died, aged 36 years.
Hamilton, Alex., died, aged 47 years.
Cowper, William, died, aged 69 years.
Elizabeth (Queen) died, aged 69 years.
Fox, Charles James, died, aged 37 years.
Washington, George, died, aged 67 years.
Mary, Queen of Scotts, died, aged 45 years.

Thomas Nast and family sailed for Europe Tuesday.

Liberal journals in England call the Premier Czar Benjamin.

Brigham Young's heirs have settled the will case, and got $21,000 each.

Bob Ingersoll made $30,000 out of his pagan, and generally red-hot lectures.

Senator Withers is stumping through the North intent upon attracting settlers to Virginia.

Senator Sharon is said to be the possessor of the comfortable little fortune of $20,000,000.

William H. Vanderbilt is said to control railroad and telegraph companies having a capital of $233,070,479.

Senator Burnside was seriously injured at his summer home at Bristol R. I., on Saturday, by a window falling on him.

Commissioner of Agriculture Le Duc is at Ithaca to inspect matters in connection with the Cornell University farm.

Minister Turner from Liberia, pronounces the scheme of colonizing Liberia with colored emigrants a shameless fraud.

B. J. Robinson-Smith offers a reward of $5 for the best treatise on "How to Make Out-door Life Attractive to the Musquito."

The Emperor of Brazil is going to Paris for the Exhibition, and has engaged for July the rooms in the Grand Hotel now occupied by the Shah of Persia.

Dr. Mary Walker is well enough to be out again dressed in a new gray Knickerbocker plaid, boots, pantaloons, long tail coat, tall silk hat, and white cotton gloves.

Elder Orson Pratt, the Salt Lake Mormon, predicts the early destruction of the earth by fire; and yet we predict that coal will be as dear as ever next winter.

In the mind of Queen Victoria the distance between herself and the Duchess of Sutherland is immensely greater than the interval between the Duchess and her cook.

A Miss Aleta Jacobs is the first woman to receive a medical degree in Holland. The degree of M. D. has been conferred on her, and she will practise in Amsterdam.

Justice Clifford celebrated his golden wedding at Portland with three sons, two daughters, and twenty-two grandchildren. It is entirely proper to say that Mrs. Clifford was there also.

The ex-Confederate Major-General Harry Heth has been appointed a special agent of the Treasury Department. He was a West Point contemporary of Hancock and Burnside, and commanded a division of the Army of Northern Virginia.

Hon. Alexander H. Stephens of Georgia is making preparations for a vigorous canvass of his district. He has purchased a carriage and pair of horses and within the next ninety days proposes to visit every county in his district, some of which he has not visited for many years.

General Rosecrans, who has just returned to San Francisco from a two months' exploring expedition through Arizona and Northern Mexico, thinks that instead of fighting with Mexico, we should proceed to build up the vast commerce with our sister republic, which we can easily do.

Walt Whitman, for the good of his now weak and paralytic frame, treats himself to protracted sun-baths and rubbing. The gray old gentleman seems to have been awakened into unusual sprightliness by the death of his friend Bryant, and has written some rich bits of prose about him.

Ex-Secretary Chandler is something of a nabob, at his home in Detroit. On every fair evening he drives out in state with two footmen and a coachman. His usual turnout is a close carriage drawn by an enormous pair of Percherons, the weight of which together is about thirty-three hundred pounds.

Mrs. Jenks is described as a woman of about thirty-five, of about medium hight, rather stout, but with a form that is still shapely. Her hair is light auburn, her face nearly round, the chin firm, but not square and heavy. Her eyes are cold, steely gray, and the nose is long and straight, but not very prominent. The expression of the face is cold, calculating and passionless.

The Rev. Joseph H. Twichell of Hartford will sail next week for Europe, for the purpose of accepting an invitation of Mr. Samuel G. Clemens ("Mark Twain"), who is one of his parishioners, to join him in a summer tramp in Switzerland and Germany, the genial humorist to bear the expenses. Mr. Clemens is now rusticating in Germany, and current report has it that he is at work with his pen on some more of those "good things" which have made him famous.

Miscellaneous.

Farmers and Gardeners,
LOOK TO YOUR INTERESTS!
THE VITATIVE COMPOUND,
Or Seed and Plant Invigorator.
The greatest discovery of its kind of modern times, for increasing the vital force and early maturity of Seeds and Plants. Patented April 21, 1874.
Early Maturity, Sure Crops, Large Yields, and
DESTRUCTION OF INSECTS.
Better than Guano or Plaster, at a fraction of their cost. The Compound is applied directly to the seed before planting, and its chemical properties insure speedy and certain germination, and by creating an artificial warmth aid the young shoot in its first stages, completely overcoming the dangers incident to wet, cold or late springs, and at the same time protecting the seed and shoot from the ravages of worms or insects. Put up in neat packages of three sizes—the smallest sufficient for a peck, the medium for a half bushel, and the largest for a bushel of seed. Price 50 cents, $1 and $2 respectively. Sent by mail or express on receipt of price.
Agents wanted. Send for Circulars containing testimonials. Address WAUGAMAN & CO.,
Care GEO. BINGHAM, Adams Express,
PITTSBURGH, PA.

It is a mistake to suppose that any department of a paper may be slighted. The most important information is to be found, at times, under the guise of an advertisement; and it is agreeable to the advertiser and a courtesy to the publisher to mention the source of your information—in ther words, to mention the paper.

Wit and Humor.

LOGIC.

He who would thrive must rise at five,

So says the proverb, though there is more rhyme than reason in it, for if

He who would thrive must rise at five.

it must follow naturally,

He who'd thrive more must rise at four;

and it will insure a consequence that,

He who'd still more thriving be,
Must leave his bed at turn of three;
And who this latter would outdo,
Will rouse him at the stroke of two.

And, by way of climax to it all, it should be held good that

He who'd never be outdone,
Must ever rise at stroke of one.

But the best illustration would be:

He who'd flourish best of all
Should never go to bed at all.

"This," said an agricultural implement dealer to an old farmer, expatiating on the merits of a new machine, "this is a patent corn planter," and putting it down, he planted it on the old Granger's corn, and raised an acher on the spot.

A MERCHANT tells us that he set a hen on an old tomato can, recently, and she had hatched five bottles of catsup, with lithographed labels, and a dozen fine tomato plants. The gentleman is an alderman, and cannot tell a lie, and would not if he could.

"WHAT will you be helped to in the way of earthly vegetables?" said M'Donald yesterday to a lady customer. "Lettuce, pray," was the quick reply. M'Donald looked sharply at the lady and concluded she was a lay preacher, until she pointed to the lettuce basket.

A YOUNG minister was preaching in Seabrook, N. H., from "I am the light of the world," and made a poor work of it, stammering and stuttering and almost stopping, when an indignant huckleberry picker, a sort of masculine woman, shouted out: "If you are the light o' the world you needs snuffing."

'T was even, and Fatalah Sayeghir
Frowned when he heard the wissokaja sing.
And the light tinkling of the foo khaloom
That echoed from the fulloha in the tayf
Filled him with grief. The tarboosh on his head.
Gay with the kossoms of the hill, he doffed,
And to the drayby with the gombaz on
He gave the shadoof that his father wore,
He leaned a little space upon his khoja khul,
And the sakiyeh in his hand, the bourhad jelb
He shook at Ibrahim Jones, the Tuarick,
And——

The remainder of the this interesting Oriental legend will have to go over until we can gather up a few more Bedouin terms. We have, as has the intelligent reader, frequently noticed that Oriental legends are valuable only in proportion to the number of unintelligible terms with which they glitter, like bits of buckle and collar plate in a link sausage. But we will hunt up a glossary and finish the legend of Balak al Shunyb some time, unless we should receive a memorial from two-thirds of our subscribers begging us us not to do so.—*Hawkeye.*

Restful Nights, Days free from Torture

Await the rheumatic sufferer who resorts to Hostetter's Stomach Bitters. That this benignant cordial and depurent is a far more reliable remedy than colchicum and other poisons used to expel the rheumatic virus from the blood, is a fact that experience has satisfactorily demonstrated. It also enjoys the advantage of being—unlike them—perfectly safe. With many persons a certain predisposition to rheumatism exists, which renders them liable to its attacks after exposure in wet weather, to currents of air, changes of temperature, or to cold when the body is hot. Such persons should take a wine-glass or two of the Bitters as soon as possible after incurring risk from the above causes, as this superb protective effectually nullifies the hurtful influence. For the functional derangements which accompany rheumatism, such as colic, spasms in the stomach, palpitation of the heart, imperfect digestion, &c., the Bitters is also a most useful remedy. It is only necessary in obstinate cases to use it with persistency.

Farm Topics.

J. B. LAWES' EXPERIMENTAL FARMING.

The several communications of Mr. J. B. Lawes, of Rothamsted, England, to the Rural New-Yorker, are still fresh in the memory of our readers. Professor Silliman has visited this great experimental farm that for over forty years has been conducted by Mr. Lawes in the interests of Agriculture with an intelligence and devotion which have rendered and do and will render the results of these experiments of a value to all agriculturists—indeed to the world—which it would be idle to attempt to estimate. If "Agriculture is the most healthful, most useful, and most noble employment of man," surely the life which Mr. Lawes has spent for its improvement with results so important and trustworthy, entitles him to a share of mankind's gratitude to which few other investigators in any field whatsoever can with equal justice lay claim.

Professor Silliman communicates to the New York World a short account of what he saw during his visit, the gist of a part of which will be found in the Rural New-Yorker of Oct. 17, '77, p. 240. "It is impossible," he says, "in any reasonable limits of space to follow the details of those most important and interesting experiments which it has required so many years to carry out, not even if I were to confine myself to a single example."

After all these years Mr. Lawes says he feels that he has but commenced a work which will demand many lives for its completion. He has therefore set apart a fund of $500,000 and a certain area of land for the continuance of these investigations when he is dead. But Mr. Lawes is still in vigorous health and scarcely over sixty years of age. We may therefore hope that he will be spared to continue his good work through many years.

Our engravings are reproductions of those published in the Gardener's Chronicle of Sep. 22 of last year, and we are indebted to the same source for the substance of what follows.

Mr. Lawes entered upon his hereditary property in 1834, when experiments were begun. But the foundation of the Rothamsted Experimental Station may be said to date from 1843. It has up to the present time been entirely disconnected from any external organization, and has been maintained entirely by Mr. Lawes

In 1854 5 a new laboratory was built, by public subscription of agriculturists, and presented to Mr. Lawes, in July, 1855, from which date an old barn laboratory was abandoned, and the new one has been occupied.

From June, 1843, up to the present time, Dr. J. H. Gilbert has been associated with Mr. Lawes, and had the direction of the laboratory.

The number of assistants and other helps has been increased from time to time. At first only one laboratory man was employed, but very soon chemical assistant was necessary, and next a computer and record-keeper. During the last twenty-five years the staff has consisted of one or two, and sometimes three, chemists, and two or three general assistants. One of these is usually employed in routine chemical work, but sometimes in more general work. The chief occupation of the general assistants is to superintend the field experiments—that is, the making of the manures, the measurement of the plots, the application of the manures, and the harvesting of the crops, also the taking of samples, the preparation of them for preserving or analysis, and the determination of dry matter, ash, &c. These assistants also superintend any experiments made with animals. There are now about 25,000 bottles of samples of experimentally-grown vegetable produce, of animal products, of ashes, or of soils, stored in the laboratory.

A botanical assistant is also occasionally employed, with from three to six boys under him, and with him is generally associated one of the permanent general assistants, who at other times undertakes the botanical work.

Two or three (for sometime over three) computers and record-keepers have been occupied in calculating and tabulating field, feeding, and laboratory results, copying, &c.

One, and sometimes two, laboratory men are employed.

The field experiments, and occasionally feeding experiments, also employ a considerable but a very variable number of agricultural laborers.

The general scope and plan of the field experiments have been:

To grow some of the most important crops of rotation, each separately, year after year, for many years in succession on the same land, without manure, with farmyard manure, and with a great variety of chemical manures; the same description of manure being, as a rule, applied year after year on the same plot. Experiments on an actual course of rotation with different manures have also been made. In this way field experiments have been conducted as follows:—

On Wheat, thirty-four years in succession, 13 acres, 35 plots, many of which are duplicates of others.

On Barley, twenty-six years in succession, 4½ acres, 23 (or 29) plots.

On Oats, nine years in succession, ¾ acre, 6 plots.

On Wheat, alternated with fallow, twenty-six years, 1 acre, 2 plots.

On different descriptions of Wheat, nine years, 7 acres (each year in a different field,) about 20 plots.

On Beans, thirty-one years (including one year Wheat and five years fallow), 1¼ acre, 10 plots.

On Beans, alternated with Wheat, twenty-eight years, 1 acre, 10 plots.

On Clover, with fallow or corn (grain) crop intervening, twenty-eight years, 8 acres, 18 plots.

On Turnips, twenty-five years, about 8 acres, 40 plots.

On Sugar Beet, five years, about 8 acres, 40 plots.

On Mangel-Wurzel, one year (in progress, about 8 acres, 40 plots.

On Potatoes, one year (in progress), 2 acres, 10 plots.

On rotation, thirty years, about 2½ acres, twelve plots.

On permanent grass land, twenty-two years, about 7 acres, twenty plots.

Comparative experiments with different manures have also been made on other descriptions of soil in other localities.

Samples of all the experimental crops are taken, and brought to the laboratory. Weighed portions of each are partially dried, and preserved for future reference or analysis. Duplicate weighed portions of each are dried at 100° C., the dry matter determined, and then burnt to ash on platinum sheets in cast-iron muffles. The quantities of ash are determined and recorded, and the ashes themselves are preserved for reference or analysis.

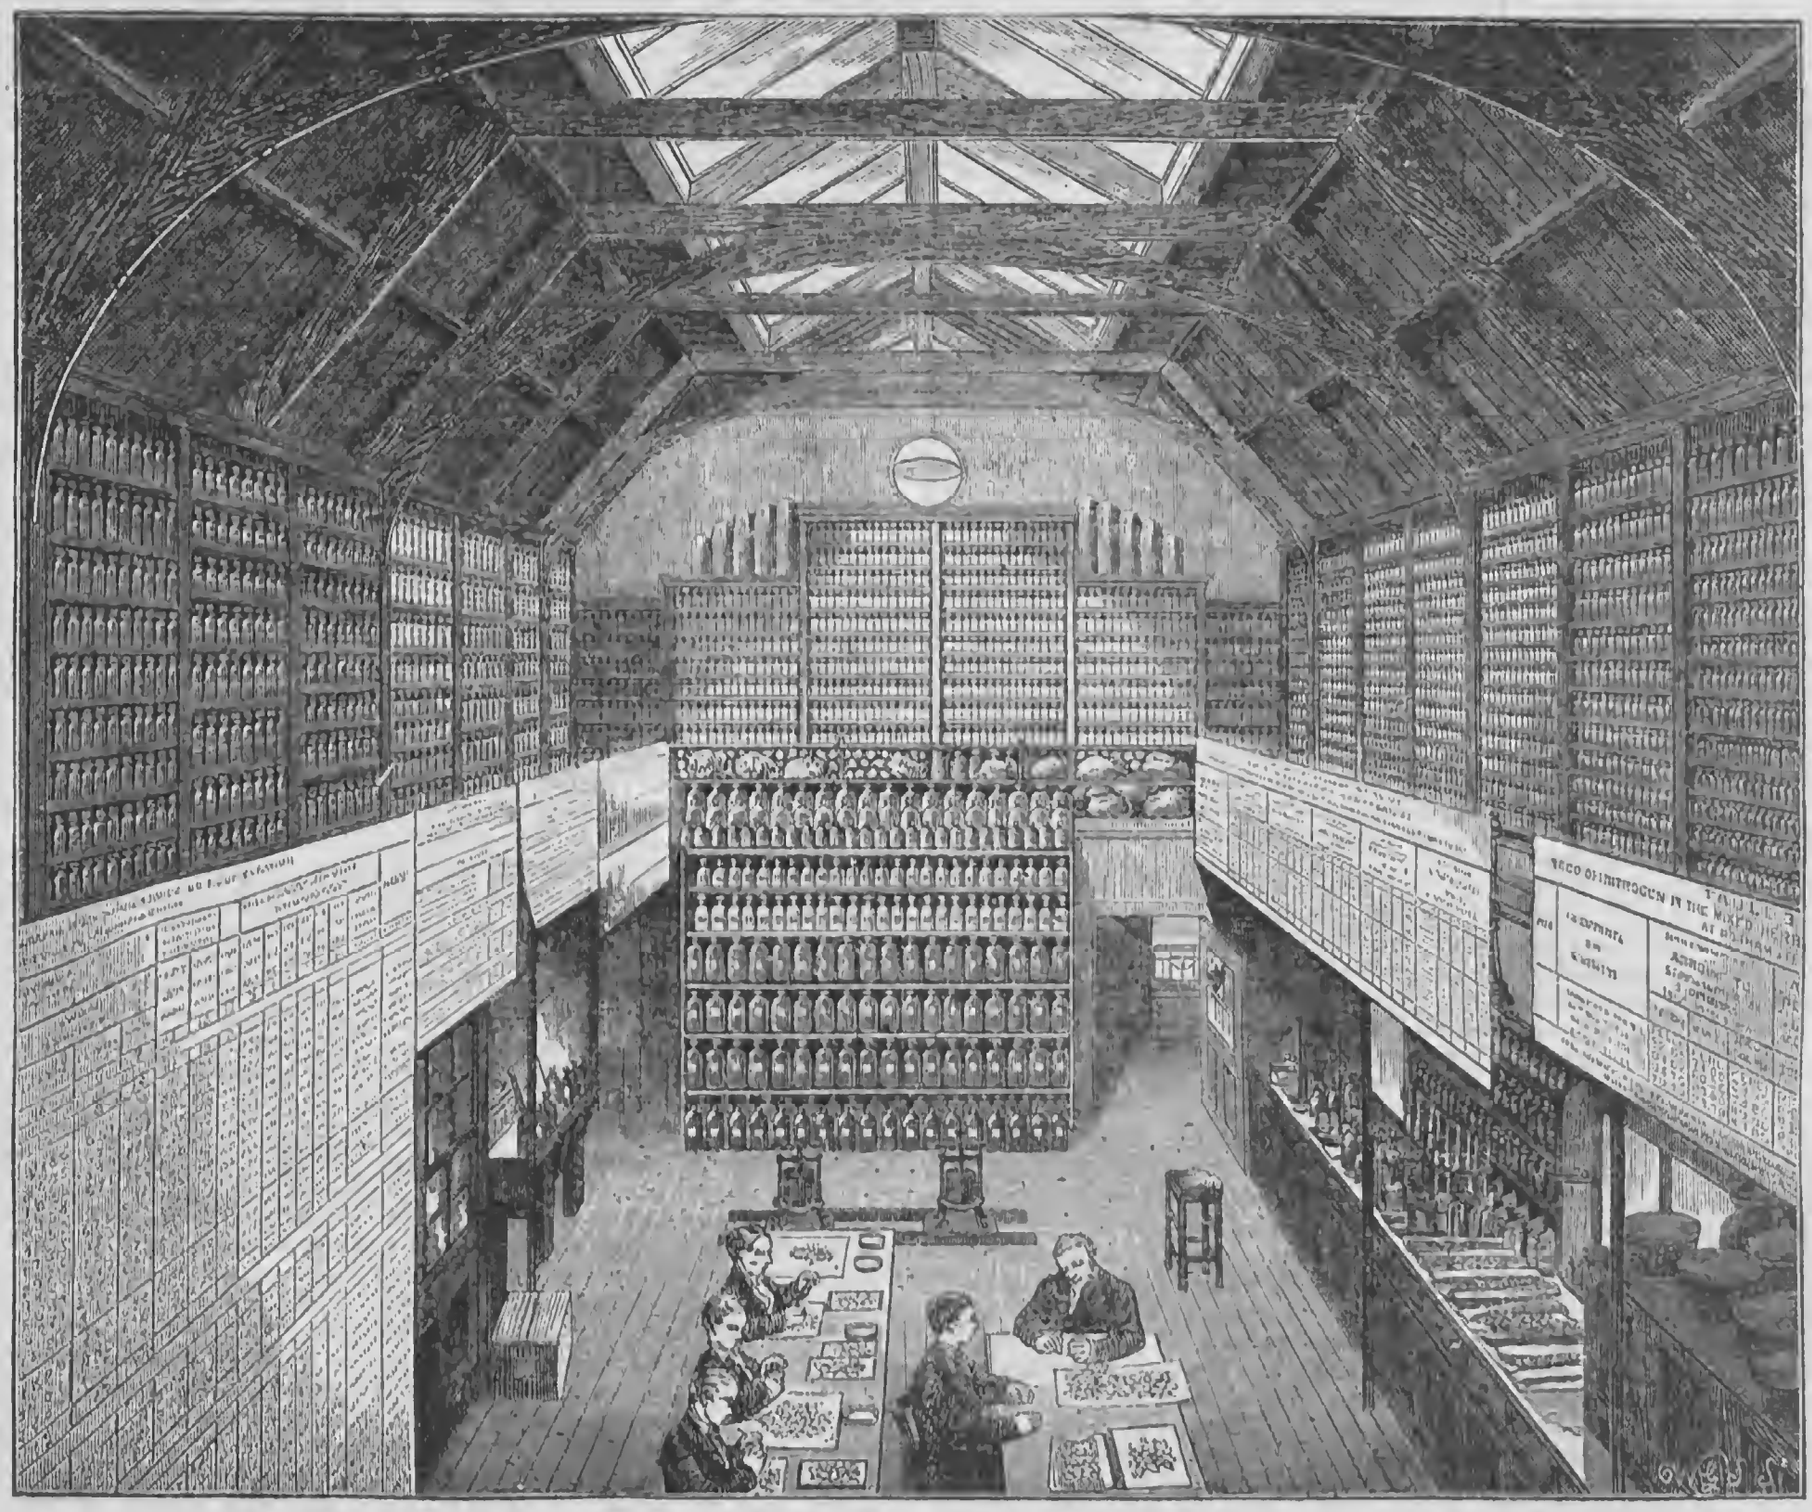
In a large proportion of the samples the nitrogen is determined.

In selected cases, illustrating the influence of of season, manures, exhaustion, &c, complete ash analyses have been made, numbering in all about five hundred.

Also in selected cases, illustrating the influence of season and manuring, quantities of the experimentally-grown wheat grain have been sent to the mill, and the proportion and composition of the different mill products determined.

In the case of Sugar Beet, the sugar, by polariscope, has in most cases been determined.

In the case of the experiments on the mixed herbage of permanent grassland, besides the samples taken for the determination of chemical composition (dry matter, ash, nitrogen, woody fiber, fatty matter, and compo



INTERIOR OF J. B. LAWES' LABORATORY AT ROTHAMSTED.

sition of ash,) carefully averaged samples have frequently been taken for the determination of the botanical composition. In this way on three occasions, at intervals of five years—viz., in 1862, 1867, and 1872—a sample of the produce of each plot was taken, and submitted to careful botanical separation, and the percentage by weight of each species in the mixed herbage determined. Partial separations have also been made in other years.

ANALYSES OF SOILS.

Samples of the soils of most of the experimental plots have been taken from time to time, generally to the depth of 9, 18, and 27 inches, but sometimes to twice this depth. In this way nearly 600 samples have been taken, submitted to partial mechanical separation, and portions of the mold have been carefully prepared and preserved for analysis. In a large proportion of the samples the loss on drying at different temperatures and at ignition has been determined. In most the nitrogen determinable by burning with soda-lime has been estimated. In some the carbon, and in some the nitrogen as nitric acid, have been determined. Some experiments have also been made on the comparative absorptive capacity (for water and ammonia) of different soils and subsoils. The systematic investigation of the amount and condition of the nitrogen, and of some of the more important mineral constituents of the soils of the different plots and depths, is now in progress or contemplated.

RAINFALL.

Almost from the commencement of the experiments the rainfall has been measured—for twenty-four years in a gauge of one-thousandth of an acre area, as well as in an ordinary small funnel-gauge of 5 inches diameter. From time to time the nitrogen, as ammonia and as nitric acid, has been determined in the rain waters.

Three "drain gauges," also of one-thousandth of an acre each, for the determination of the quantity and composition of the water percolating respectively through 20 inches, 40 inches, and 60 inches depth of soil (with its subsoil in natural state of consolidation), have also been constructed. A more numerous series of smaller "drain gauges," arranged for the investigation of the influence of different crops and of different manures, are in course of construction. Each of the differently manured plots of the permanent experimental wheat field having a separate pipe-drain, the drainage waters have frequently been collected and analyzed. Professor Frankland has determined the nitrogen, as ammonia, as nitric acid, and as organic nitrogen, and also some other constituents, in many samples both of the rain and of the various drainage waters collected at Rothamsted; and Dr. Voelcker has determined the combined nitrogen, and also the incombustible constituents in many of the drainage waters.

AMOUNT OF WATER TRANSPIRED.

For several years in succession, experiments were made to determine the amount of water given off by plants during their growth. In this way various plants, including representatives of the gramineous, the leguminous, and other families, have been experimented upon. Similar experiments have also been made with various trees.

We have no more space to give to the enumeration of the experiments which have been carried on at Rothamsted. The results of all this labor and skill have, to a considerable extent, been given in the Journals of the Royal Agricultural and Royal Horticultural Societies and in other publications, but the very number of these scattered records and their prodigious wealth, variety, and complexity of detail render them difficult to be grasped by an ordinary scientific reader. Life is short, art is long. The time seems to us to have come when the directors of this noble experimental station should gather together into one harmonious consecutive treatise the main results of their labor and the legitimate inferences therefrom. We are, of course, aware that to some extent this has already been done. Most of the very numerous publications of Messrs. LAWES and GILBERT contain summaries, but these summaries themselves now require consolidating, and their mutual relationship made clearly evident.

The Gardeners' Chronicle alluding to the descriptive article referred to, finishes a leading editorial with the following pertinent remarks:

"In what other country would services so splendid and so disinterested be allowed to pass unnoticed by the nation? True, such honors as science can give have been bestowed, and agriculturists have not been unmindful of what has been done for them; but surely this is a case for Governmental recognition. Had Messrs. LAWES and GILBERT and their several associates in their respective degrees been soldiers or sailors, they need not have effected a tenth part of what they have done to have been the recipients of State honors and rewards. Doubtless their own satisfaction at the results of their labors is the best and sweetest reward they themselves could look for; but, as a matter of national honor, it is greatly to our discredit that services so long continued and so valuable should have been allowed to pass without State recognition."

ILLUSTRATIONS.

Our illustrations represent views on the farm of Mr. LAWES at Rothamsted, Eng.; the interior of the laboratory, with its myriads of analyses and records; the rain-guage, one-thousandth of an acre in area; other drain-guages of like area, but filled with soil of various depths, to show the quantity of rain that percolates through strata of different depths, and others again of smaller area arranged in a circle, and destined to show the amount of rain penetrating through soils of various characters, degrees of consistency, in a natural state or artificially consolidated, and mixed with farm-yard and various artificial manures. Further, some of these gauges are intended to show the amount of rain that percolates through a given area and depth of soil when bearing a crop of cereals or other plants with different root and leaf action, etc. The rain so collected, together with the drainage water from some of the fields, is not only measured but subjected to chemical analysis, to show its constitution.

SOME IMPORTANT RESULTS.

Referring now to Prof. SILLIMAN'S communication to the World:

The experiments upon permanent meadow or park grass land have been continued over twenty years, and have been attended with curiously instructive and useful results. It appears from a careful botanical scrutiny by actual count of all the product ent upon a given area of land which had been in grass for centuries, and enriched only with barn-yard manure, that the flora contained about fifty species of plants, which were tabulated according to their respective abundance by actual count and with their systematic names. It is found that the more worthless of these meadow plants are subordinated by treatment to the more useful in such a way that, in case of the continuous treatment by certain mineral manures only, while the annual average clip for twenty years has risen from twenty-one and a quarter hundred-weight produce per acre, weighted as hay, to sixty-two and a half hundred-weight per acre, the number of species of plants has diminished from fifty to about twenty, and these the most useful of the grasses, &c. Not that the other thirty have been exterminated, but rather that they are smothered and subordinated by the vigor of the more valuable plants, although in the case of some of the most noxious weeds, they seem to be exterminated.

Those curious in such matters will wish to know what the exact treatment in this case was, and the facts are of sufficient interest to merit the attention of any thoughtful reader. The treatment was exclusively by mineral manures, without a particle of vegetable or carbonaceous substance whatever. For example, in this particular case the annual quantities per acre employed were as follows, viz.:

	Pounds.
Sulphate of potassa	300
Sulphate of soda	100
Sulphate of magnesia	100
Superphosphate of lime, 3½ cwt	392
Ammonia salts, equal parts sulphate and muriate of ammonia	800
Total per acre mineral manure	1,692
To this quantity was added on another equal plot silicate of soda	400
Total	2,092

The silicate of soda was commenced only in 1862, or thirteen years after the series of experiments was entered on. Its effects are most marked, for while for the first twenty years the average of hay cut was about 61 hundred-weight, it rose for the twenty-second season (1877) to the enormous aggregate of 110 hundred-weight! But it should be stated that in this year there were two cuttings or crops of 60¾ and 49¼ hundred-weight respectively, and that the continuously unmanured ground next adjoining gave in the same season also two crops of respectively 19½ and 25¼ hundred-weight, or a total of 44¾ hundred-weight. In other words, the land continuously fertilized with mineral manures of the above composition gave 5½ tons of hay per acre, and the adjacent unmanured gave 2 1-5 tons. It will be seen that the only source of nitrogen added by this treatment was from the salts of ammonia, while the carbon was evidently obtained by the plants from the carbonic acid of the atmosphere, since not a particle of carbonaceous food was supplied, and the soil had become practically exhausted of carbon.

CONCLUSIONS.

No single fertilizer, whether mineral or organic, is capable of producing the highest attainable production of hay; barn-yard manure alone will carry the production only to a certain point, where it remains stationary at about half the maximum attained by mineral manures alone, as in the example just cited above. This maximum for barn-yard manure alone is about forty-nine hundred-weight of hay per acre. The old notion that a certain amount of humus, or decomposing organic matter, is essential to enable plants to assimilate carbon, is an error, since the highest results attained have been reached and maintained steadily without a particle of carbonaceous substance added to the soil. Nitrogen, the most essential element of fertility, perhaps, for both cereals and grasses, is supplied most readily by use of ammoniacal salts, but its highest effects are not attainable by the use of such salts alone, since the effect of such nitrogenous fertilizers is much enhanced by the use of silicate of soda and ammoniacal salts alone do not effect the same results which are attained when they are used in connection with certain alkaline salts, whether sulphates or nitrates. The same or a larger amount of nitrogen in the form of nitrate of soda or potassa fails signally to promote, on grass land, the production attained by the use of sulphates of the same alkaline bases when ammoniacal salts are used as the source of the nitrogen. The question of whether plants can assimilate directly free or uncombined nitrogen was carefully investigated at Rothamsted by our lamented countryman, Dr. EVAN PUGH, many years since, and was decided in the negative. Dr. PUGH'S memory is tenderly cherished in the place where he worked so long and so well.

THE WHEAT FIELD

called "Broadbulk," of about thirteen acres, offers a most instructive and interesting study, as Prof. Silliman saw it on the 8th of June, under the guidance of Messrs. Lawes and Gilbert. It needed no skill to see the immense disparity between the several plots of grain growing side by side and under treatment for over a quarter of a century by different fertilizers. It is notable that this old field upon the English chalk, left unmanured continuously for the whole period of time of these experiments (there are two such plots upon it,) yields an average of 14 bushels of wheat per acre, and this is just about the average of the unmanured wheat lands of the United States; the total wheat lands with us averaging, if we do not mistake, about 15 bushels to the acre. At Rothamsted each plot of these 13 acres has its own under-drain, and has been subject all these years to a separate and distinct treatment. The results are most instructive and worthy of study. Many cherished notions of certain theorists are now completely demolished by the quiet logic of facts, while others are confirmed. Thus 14 tons per acre of farm-yard manure have raised the average yield of this land from 14 to 35 bushels of wheat to the acre. The addition of 200 pounds of sulphate of potassa, 100 pounds each of sulphate of soda and magnesia and of 3½ hundred-weights of superphosphate of lime resulted in raising the average yield of this land to only 16 bushels to the acre, a result quite insignificant, and discouraging, it would seem, to agricultural chemistry. But the one element of success was wanting, namely, ammonia, and consequently it was found when this is added to the same mixture just enumerated, a quantity of 200, 400 and 600 pounds respectively of ammonia salts, there was an increase of yield to 25⅜, 31¼ and 37⅛ bushels of wheat respectively. That it was the nitrogen of the ammonia which did the work was most evident, since it appeared when an equivalent of nitrogen was used in the form of nitrate of soda in place of the ammonia there was almost an identical maximum yield of wheat, all other things remaining quite the same. Nor was it sufficient to use the ammonia salts alone, for then the best result attained was the production of under 22 bushels of wheat. Even the addition of the superphosphate to the ammonia salts raised the product only to 27½ bushels, and it is clear from all the experiments that a combination of mineral manure with superphosphate of lime and ammoniacal salts is essential to the production of the highest condition of fertility.

NOTES FROM MAPLEWOOD FARM.

HECTOR BERTRAM.

THE buckwheat is all sown—finished July 8th. Pretty late, some may say, and it may be, one season in six; but, as a general thing, the later buckwheat can be sown and avoid the Fall frost the better the yield. The hot glare of the sun causes the blossoms to wither before the grain is formed when sown early, in the majority of cases, while the cooler days of the later months are more congenial to its formation. It is a generally accepted idea among some farmers that buckwheat requires—yes, really *requires* poor soil for its successful growth. This, like many others that creep into the minds of many of us, is a very erroneous one. While it will, without doubt, yield larger returns from an impoverished soil than most grains, it can be grown to much better advantage on rich soil. The ground must be well shaded if satisfactory results are to be obtained, and if the ground is not in condition to produce sufficient straw for this purpose, the crop will be far from good.

Our grandfathers used to consider a half bushel of seed to the acre a great plenty; now, most farmers sow a bushel. Why the greater quantity of seed required now than then? Then the land was rich from the manurial deposits of ages, in the shape of decayed vegetation, leaves, and timber; now our soil, in many cases, is impoverished by constant cropping, and actually requires the extra amount of seed in order to produce a sufficient growth, to shade the land from the searching rays of an August sun. If our land were sufficiently rich, we would require no more than then. I remember my grandfather once sowed a field of buckwheat, using only a little over a peck of seed per acre. Of course, when the plants appeared they were far apart, hardly near enough to be neighborly. A neighbor passing exclaimed: "Why, man what were you thinking of? That is an excellent piece of ground, and would have given you an immense crop if you had only sown it thick enough."

The season was favorable and the grain grew finely, sending out numerous branches until it became a perfect mass all over the ground. The neighbor passing again just as the grain was forming, paused where the old gentleman was at work, and with an air of superior knowledge suggested, "You would have had an *awful* crop, Dr., if you hadn't sown it so thick." The trouble is this:—Farmers do not consider buckwheat a profitable crop, and only sow their poorest land with it, when, in reality, it is as much so as oats, and much better for subduing rough or new land. Mr. Morey advances an idea which I can hardly accept in regard to the time of sowing. It is this—that the grain is formed at the same hour in the day that the crop is sown, and always sows his buckwheat after sundown, in order to avoid the blasting effects of the sun upon the embryo grain, when it is changing from the ideal to the real. There may be something worthy of consideration in the thought, yet I think most men will set it down as simply "an old woman's whim."

Haying is here again, and coming with wheat harvest in this locality, will make busy times until the crop is all secured, which, judging by the present condition of the weather, will be for a considerable length of time. Our forty acres of meadow was never better. Much of it, owing to the heavy showers of the past week, lies nearly as flat as though it had been rolled. As a general thing, we do not begin our haying early enough. Judge Balcom advocates cutting the timothy as soon as the heads are formed, before the blossoms appear. This I consider *too* early. The grass requires much more care in curing, and when obtained, is tough and wirey. The cattle cannot masticate it sufficiently to obtain from it the full benefit. Besides, as old farmers say, there is not so much "heart" in it as when cut at maturity. However, I think this not so bad a fault as leaving it until over-ripe.

Three men and three horses, with the present improved machinery, can secure a large amount of hay in a short time when the weather is favorable, and there can be no excuse for the black timothy straw stripped of half the seed and offered in our markets as hay. Grass should never be left until it can be cut in the forenoon and drawn after dinner. And it gives hay of much better quality and better appearance if put up and cured in the cock than if left spread over the field until the sun's rays have drawn from it all moisture—the juice of the grass—which possesses its most nourishing qualities, and must be retained in order to constitute it "good hay." In cutting wheat, we prefer to leave it standing until it is sufficiently ripe, to bind and shock immediately. Left in the swath, there is much danger of the grain sprouting, especially when we have warm showers and hot sun alternately, as at present. In my own experience I have found few men who did not consider it better to let wheat cure in the shock.

Put up in round shocks, a dozen in a place, two of them placed crosswise for caps, wheat will remain uninjured for weeks in the field and cure out perfectly, withstanding severe storms, provided the caps are kept in place until settled. Michigan farmers have a rule by which to set up their wheat, and scarcely ever deviate from it. Four sheaves are set in a row, *north* and *south* at first, then three on each side. This makes ten sheaves, and the shock is perfectly round, with no place for another sheaf without marring its proportions. The two caps are then broken down at the ends and placed crosswise on top, forming a complete roof for the ten standing upright. They claim they stand much better in this manner than when the first sheaves are set east and west.

Farm Economy.

DRAINAGE.

PROFESSOR R. O. CARPENTER.

USE OF SYSTEM.

IT is probable that most of you have seen drains put down without all this preliminary work, and very likely a great many of these drains have worked well, and you will raise the question at once, "Is all this preliminary work necessary? Why not begin at once with the tile laying, and lay by the eye, instead of by the string, which requires considerable patience to set?" Your attention has been already called to the probability of mistakes, especially when the land is nearly level. If you practice much with the level you will soon find that although the eye can see straight it cannot see level. I will mention one instance of this: In the west portion of the College grounds is a valley, which, lying as it does, at the foot of quite a hill, seems very deep; separated from this by a small rise of ground, is a piece of land which gently slopes in the opposite direction. The valley was drained several years ago, an expensive outlet was built and a thorough system of drains was put in. More recently it became necessary to drain
